At the end of the year, under the Spartan system, Lysander was replaced. His successor, Callicratidas, obstructed by Lysander's supporters, fell out with Cyrus and was defeated off the Arginusae islands. In consequence both Cyrus and their Greek allies urged the Spartans to restore Lysander to the command and they responded by giving him effective control for the year 405 BC as the nominal second-in-command to Aracus. Cyrus, whose original funds had long been exhausted, somehow found the money to enable him to rebuild his fleet; in the late summer, after some clever manoeuvring in the central Aegean, he reached the Hellespont (the Dardanelles) ahead of the Athenian fleet, taking Lampsacus by assault and from there threatening to intercept the ships bringing Athens' corn supplies from the Black Sea. The Athenians followed him into the straits and, to avoid having to battle continually with the powerful southwest-flowing current, based themselves on an unsuitable beach at Aegospotami. On four successive days they rowed out to offer battle, but without response, and on the fifth Lysander, who had observed how the Athenians, after beaching their ships in the evenings, had scattered in search of food or rest, waited for them to retire and then ordered his ships to attack. All but 10 of the Athenians' 180 ships were taken with little resistance in what was truly a decisive victory. It was the last fleet that the Athenians could muster, but until that evening they could still have avoided defeat and even won the war.

Lysander then toured the Aegean, driving Athenian settlers back to increase the hungry mouths at home and removing their friends from power in the various cities, and then brought his fleet, now of 150 ships, to Aegina to join the land armies in the final siege of Athens. When surrender terms were agreed in the spring of 404 BC, he sailed into the Piraeus to supervise the demolition of the walls. Soon after he assisted in the establishment of an oligarchic regime, the "Thirty Tyrants", which soon proved cruel and oppressive.

While the Athenians could hardly have expected anything better (and many, no doubt, feared worse), the Spartans' new allies in and around the Aegean must have hoped for more generous treatment than they now received at the end of a war that the victorious Spartans at the start had declared was undertaken to "free the Greeks" (Thucydides, 1. 129 and 2. 8). Lysander, however, favoured close control, in this very proba-

bly looking to secure the allies' loyalty to himself as much as to Sparta. According to Plutarch (*Lysander*, 5), he was already in 407 BC plotting with local aristocrats to set up decarchies (councils of ten) to rule liberated cities, and after Aegospotami in 405 BC he carried out this policy, installing Spartan officers (harmosts) in the cities to support the new regimes; Plutarch adds (13) that he assisted in a number of massacres, a generalization illustrated by his later account (19), supported by that of Diodorus (13. 104), of events at Miletus. Lysander's recall to Sparta and the modification of his policies, probably in 403 BC, failed to convince most of the new allies, who broke away when the Spartan fleet was defeated by the Persians off Cnidus in 394 BC.

Meanwhile in mainland Greece Lysander maintained a hard line. In 403 BC he would have suppressed the resurgent Athenian democrats, had he not been superseded by king Pausanias, who brought an end to civil war with an amnesty and restored the democracy. He remained influential, helping to secure the kingship for Agesilaus II in a disputed succession in 400 BC, but being rejected by him when be accompanied the king on his expedition to protect the Asiatic Greeks against the Persians (396 BC) and the allies assumed that he, not the king, was really in charge. In 395 BC, irked by the independent line taken by the Thebans since Athens' surrender, he was very probably one of those who persuaded the Spartan leadership to declare war on Thebes on behalf of the Phocians (Plutarch, *Lysander*, 28). This was the Corinthian War, during which the Athenians recovered real independence and the Spartans, under pressure, were restored to their leading position in 387 BC only after regaining Persian support. Lysander was at once sent with an army to collect a Phocian contingent, invade Boeotia, and link up with Pausanias at Haliartus, but on arriving there early he rashly became engaged in a battle and was killed. His personal ambition had done much to damage the Spartan position, but whether he planned to have the rules of the Spartan kingship altered to open it up to leading men outside the two royal houses, such as himself, as was alleged after his death (Plutarch, 30), is doubtful.

Lysander has not had a great impact on the modern world. A type of aircraft that gave good service to the British Royal Air Force in World War II in many regions including Greece was named after him, but this could well have been due to his being included among the "great men" in the marching song *The British Grenadiers*; he probably owed his presence there to the fact that his name rhymes with Alexander.

Biography

Lysander was appointed admiral of the Spartan fleet in 407 BC and won a great victory over the Athenians at Aegosporami in 405, during the Peloponnesian War. Having secured the surrender of Athens in 404 he assisted in the establishment of the "Thirty Tyrants". At Sparta he secured the kingship for his lover Agesilaus II in 400. In 395 he helped persuade the Spartans to declare war on the Thebans and was himself killed in battle.

Lysias *c.*459/58–*c.*375 BC

Athenian orator

Lysias' father was a Syracusan who, in the mid-5th century BC and on the invitation of Pericles, settled in Athens as a resident alien. He became extremely wealthy, since he was a manufacturer of arms and armour at a time when Athens was almost continuously at war. Lysias himself, with his brother Polemarchus, spent some time at Thurii in southern Italy, but returned to Athens well before the end of the 5th century BC. After being decisively defeated by Sparta, Athens was ruled in 404–403 BC by a group of men who (with Spartan backing) operated as a collective dictatorship and earned the name "the Thirty Tyrants". They killed Polemarchus, arrested Lysias, and seized all the property held by the family in Athens. Lysias managed to escape, and through his property abroad and rich foreign friends he was able to give significant financial help to the Athenian exiles who eventually expelled the Thirty and restored democracy. He died *c.*375 BC.

As a resident alien Lysias could not participate directly in Athenian political life, but he was greatly in demand as a speech writer for people involved in litigation, who were required to speak in person, for there were no professional "solicitors" or "barristers" in Athens, and prosecutions for criminal offences were normally conducted by individual citizens motivated by patriotism, officiousness, political ambition, or enmity towards the defendant. Oratory had always been regarded in the Greek world as a major art form, a key to success not only in the courts, but also in councils and assemblies, and from the mid-5th century BC, at least in a democratic city such as Athens, there were rhetoricians who professed to teach oratory to politically ambitious young men.

A generation before Lysias the Athenian Antiphon inaugurated the practice of circulating speeches composed for clients, and Lysias followed this practice. So did other speech writers, and the formal structure of a speech was extended to what are sometimes called political pamphlets but correspond most

closely to modern articles in periodicals of general interest. So far as concerns forensic speeches, it is of course impossible to find out the relation between the written text and what was actually said in court. We very rarely know the outcome of a case, but an ancient tradition, originating perhaps in a boast by a friend or a relative of Lysias after his death, alleged that he lost only two cases in his life.

At the end of the 4th century BC there existed no fewer than 425 speeches attributed to Lysias. A high proportion of those attributions is likely to have been false, because in an age where there were no publishers' contracts, no law of copyright, no royalties, and indeed rather little documentation in general, booksellers (like music sellers in the early 18th century AD) had the profitable habit of ascribing to famous names works actually composed by very obscure authors. In the late 1st century BC literary critics ruled out as spurious – mainly on stylistic, sometimes highly subjective, grounds – practically half the total of speeches sold under the name of Lysias. This was a time of reaction against the over-elaborate, formalized style which had come to dominate Greek oratory, and Lysias came to be admired not only for his spare, lively, and natural style but also for the way in which he seemed to invest a speaker with a character that was consonant with that speaker's status and likely to make a favourable impression on a jury (which had no presiding judge to sum up or guide it on points of law). In any country nowadays where ancient Greek is taught, selections from Lysias often constitute the learner's first introduction to Classical Attic prose texts.

In late antiquity Lysias, together with others who have come to be labelled the minor Attic orators, was overshadowed by Demosthenes (born about the time of Lysias' death), and only 27 speeches attributed to Lysias, plus seven truncated or mutilated, survived into the Middle Ages. They include a funeral speech for the Athenian war dead of a year in the late 390s BC and a portion of a ceremonial speech at the Olympic Games. Plato inserts in his *Phaedrus* a sophistic exercise in paradox which he presents as a composition by Lysias, but whether it is genuine or a clever parody by Plato remains disputed. It is difficult for us to form opinions of our own on the authenticity of any of the surviving speeches except no. 12, which was delivered by Lysias himself, prosecuting a member of the Thirty for the murder of his brother Polemarchus. Some of them, however, exhibit distinctive features of language which cannot all be explained by difference of genre or characterization.

KENNETH DOVER

Biography

Born *c.*459/58 BC the son of Cephalus, a resident alien (metic) in Athens from Syracuse, Lysias and his brother Polemarchus went to Thurii in southern Italy. They left Thurii after the Athenian military disaster in Sicily and returned to Athens as metics. In 403 both brothers were arrested by the "Thirty Tyrants" and Polemarchus was killed. Lysias escaped and achieved distinction as a speech writer. He died *c.*375 BC.

Lysippus

Sculptor of the 4th century BC

Lysippus was a sculptor from Sicyon in the Peloponnese. Although Pliny (*Naturalis Historia*, 34. 51) places him in the 113th Olympiad (i.e. 328–325 BC), Lysippus was active long before. For example, his statue of Troilus of Elis, victor in the chariot race at Olympia, is likely to date from soon after 372–368 BC (Pausanias 6.1.4), and his portrait of Pelopidas, a Theban general, was dedicated by the Thessalians at Delphi *c.*363/62 BC. Lysippus may have been active as late as 316 BC when he was apparently commissioned to make an amphora for Cassander on the occasion of the foundation of the town of Cassandreia (Athenaeus, 2. 784). This suggests that he was probably born around 390 BC.

Lysippus, like the Athenian Praxiteles, was celebrated in antiquity for his achievement in representing realism (Quintilian, *Institutio Oratoria*, 12. 10. 1–10). Pliny (*Naturalis Historia*, 34. 65) specifically commented on the way that Lysippus represented hair, and noted the way in which he made the heads of his statues smaller than his predecessors. His statues were also said to be slender, which apparently had the effect of making them seem taller. The overall effect, in ancient eyes, was that Lysippus represented men "as they appeared". His genius is reflected in the fact that ancient art historians considered that he had no teacher; Pliny (*Naturalis Historia*, 34. 61) records the tradition that he was inspired to become a sculptor by the painter Eupompus.

Pliny noted that Lysippus was a prolific sculptor, and some 50 statues have been attributed to his hand. His popularity is reflected in the story that on his death he had 1500 gold coins stored away, one for each of the statues he had created. Such numbers are unlikely and probably represent his influence on his "school"; Pliny (*Naturalis Historia*, 34. 66) accepts that it was hard to distinguish between the works of Lysippus and those of his pupils. Lysippus seems to have made largely bronze statues.

One of his famous statues was a colossal bronze *Heracles* which once stood on the acropolis of the Greek colony of Tarentum in southern Italy. This was carried away to Rome by Fabius Maximus in 209 BC and was displayed on the Capitoline. It was apparently taken to Constantinople, where the Byzantine historian Niketas Choniates described it in the 13th century. This statue has been associated with the marble statue of a muscular *Heracles* leaning on his club that was found in the baths of Caracalla in Rome (it is now in Naples), but this Roman copy was in fact the creation of an Athenian sculptor, Glycon. A second colossal bronze statue, 18.3 m (40 cubits) high, also from Tarentum, could still be seen in the agora of the city in the 1st century AD, and is recorded there by Strabo (6. 3. 1).

As with other Greek sculptors, Lysippus' works were collected and copied in the Roman period. Pliny records the tradition that Lysippus' *Apoxyomenos* was removed from in front of the baths of Marcus Agrippa and placed in the bedroom of the admiring emperor Tiberius. One of Lysippus' smaller statues was the *Heracles Epitrapezios*, which by the late 1st century AD was in the private collection of one Novius Vindex and celebrated by both Martial (9. 44) and Statius (*Silvae*, 4. 6. 32–47). The statue, which shows the seated hero holding out a drinking cup, had apparently been made for Alexander. Although small-scale Roman copies are known, a large-scale copy was discovered at Alba Fucens in Italy, which might suggest that Lysippus himself produced the same statue type at different scales. Lysippus followed Praxiteles in making a bronze (rather than marble) statue of *Eros* for the Boeotian city of Thespiae; possible Roman copies have been identified.

There is a tradition, undoubtedly erroneous, that Lysippus alone was allowed to create portraits of Alexander. However what is clear is that Lysippus was engaged in making royal portraits and images of members of Alexander's court. This association between Lysippus' home polis of Sicyon and Macedonia can perhaps be explained by the friendship between Aristratus, tyrant of Sicyon and the Macedonian royal family. Lysippus' portraits of Alexander apparently showed the subject with his face turned upwards towards the sky; Plutarch (*Alexander*, 4) noted that Lysippus recorded the main characteristics of Alexander: "the poise of the neck turned slightly to the left and the melting glance of the eyes". Such a pose can be recognized in Hellenistic portraits of Alexander, such as those found at Pella and Pergamum.

One of the monuments that Lysippus created was to commemorate the 25 companions who died in Alexander's victory over the Persians at the river Granicus (in northwest Turkey) in 334 BC. This group, which included a portrait of Alexander, was erected at Dion in Macedonia and is probably to be identified with "Alexander's Squadron", a group mentioned by Pliny. It was carried off to Rome by Quintus Metellus in 148 BC. Another of Lysippus' Macedonian groups was the *Alexander's Hunt* which was dedicated at Delphi. The inscription from the base of this bronze group shows that it was erected by the son of Craterus, one of Alexander's generals.

Lytras, Nikephoros 1832–1904

Painter

Nikephoros Lytras was one of the principal members of the so-called Munich School which included Greek artists trained at the Bavarian capital, such as, among others, Nikolaos Gyzis (1842–1901), Polychronis Lembessis (1849–1913), Konstantinos Volanakis (1837–1907), and Georgios Iakovides (1853–1932). Lytras was the first major Greek painter, moreover, who, after completing his training abroad, returned to his homeland to undertake the artistic formation of a younger generation of Greek artists at the School of Fine Arts in Athens. He therefore deserves his epithet as "father of the modern Greek school of painting".

Lytras's own training began in the fledgling art school of the Athens Polytechnic of the mid-1850s under the guidance of mostly foreign teachers who lived and worked in Athens, primarily the Bavarian painter Ludwig Thiersch (1825–1909). Thiersch was a graduate of the Munich Academy and a follower of the Nazarenes who had revived interest for Italian Renaissance religious painting in the manner of early Raphael using the technique of fresco. Accordingly, Lytras' earliest works, murals in small local churches in Athens and its vicinity, combine his teacher's interest in religious art with an effort to evoke Greek traditional forms of sacred art inspired from his study of Byzantine mosaics in the nearby churches of Daphni and Hosios Loukas. He sent an early example of his work to the Paris International Exposition of 1855 – a *Madonna and Child* (Monastery of the Virgin, Tinos), in which the figures of the Virgin and infant Christ followed Byzantine

models and were depicted against the traditional gold-leafed background of Byzantine icons.

His interests shifted dramatically, however, during his years of study at the Munich Academy, between 1860 and roughly 1865. There he came under the influence of the academic history painter Karl Theodor von Piloty (1826–86), who became his teacher, as well as that of the old masters, especially Rubens and Rembrandt, whose works he studied in the Alte Pinakothek. Even during those years of complete immersion into a western European art tradition, however, he pursued his attempts to merge his Greek heritage with the example of his teacher's academic historicism. A case in point is Lytras's painting *Antigone Discovers the Body of Polynices* (1865, National Picture Gallery, Athens), with its subject inspired from Sophocles cast in the compositional and stylistic terms of Munich-style academic history painting, particularly Piloty's celebrated painting *Seni before the Body of the Dead Wallenstein* (1855, Bayerische Staadtsgemaldesammlungen, Munich). At the same time, however, he frequented the circle of younger artists in Munich, including Wilhelm Leibl, Wilhelm Trübner, Hans von Drefregger, and Franz von Lenbach, who explored portraiture and everyday-life themes ("genre painting") with an ethnographic character depicted in a realistic manner. Two artists from Dusseldorf, Benjamin Vautier and Ludwig Knauss, whose works exemplified picturesque ethnographic genre painting, also served as his models.

It was portraiture and genre painting that constituted the majority of Lytras's output after his return to Greece in 1865–66 and his appointment to a professorship at the School of Fine Arts in Athens. Apart from his teaching, he received commissions from public institutions, but also from wealthy, educated, cosmopolitan bourgeois patrons who formed the new Athenian upper class of the post-Ottonian years. His portraits reflect German academic models, and also his awareness of the French avant-garde. For example, his portrait of *Lysandros Kaftantzoglou* (1885–86, National Picture Gallery, Athens), the Director of the Athens Polytechnic, represents him seated at his desk in the manner of Manet's famous portrait of Emile Zola (1868, Musée d'Orsay, Paris) which Lytras could have seen during his visit to Paris in September 1876, the year of the second Impressionist exhibition. Later portraits include the two life-size portraits of king Otho and his wife Amalia commissioned by the Philekpaideutiki Etairia, an educational society, for their headquarters. These show Greece's first Bavarian king and his queen dressed in Greek national dress posing against the ruins of the Acropolis in the background (1893, Philekpaideutiki Etairia, Athens).

At the same time, his interest in history and genre painting, developed during his years in Munich, was applied to themes inspired from modern Greek history and customs. The large history painting *Kanaris Blowing up the Turkish Flagship* (*c.*1873, Athens, private collection) shows an episode from the Greek War of Independence, a feat of sabotage performed by Constantine Kanaris and his companions in 1822, which was followed by brutal Turkish reprisals on the population of the island of Chios. From the same period, 1870–90, date some of his best-known scenes of ethnographic genre, with an emphasis on local traditions and customs, local costumes, and sentimental, anecdotal plots. *The Carol Singers* (*c.*1873, private collection, Athens,) and the unfinished *Mourning the Dead in Psara* (*c.*1880, National Picture Gallery, Athens) illustrate customary rites and rituals of Greek rural life in a style imbued by the sentimental realism of Dusseldorf and Munich genre painters. These and similar works reflect the contemporary literary trend towards rustic, ethnographic narratives as represented by the novels of Dimitrios Vikelas (for which Lytras intended to supply illustrations), Alexandros Papadiamantis, and Georgios Vizyinos. Lytras's use of a familiar, realistic formal treatment in his paintings parallels the contemporary struggle of the popular demotic dialect to prevail over its better-established rival, the sophisticated *katharevousa*, or "pure one". (Ironically when it came to linguistic preferences, Lytras supported the latter.) A trip to Asia Minor in 1873 in the company of his friend and fellow painter Nikolaos Gyzis prompted several paintings with orientalist subject matter – chieftains, pirates, Arabs – similar in spirit to those highly popular works of his contemporary, the French painter Jean-Léon Gérôme.

Lytras' influence was felt on his numerous pupils at the Athens School of Fine Arts. They included Lembessis, Iakovides, Spyros Vikatos (1878–1944), and his own son Nikolaos Lytras (1882–1927). They carried on the tradition of rural, ethnographic themes while incorporating some of the advances of Impressionism in their use of *plein-air*, a more luminous palette, and a lighter brushstroke.

M

Macarius (pseudo-)

Monastic writer of the 4th century

From at least the early 6th century a substantial body of works has been ascribed to St Macarius the Great, founder of the monastic community at Scetis. A 13th-century manuscript carries a marginal note that casts doubt on this ascription, a suspicion that was developed by the 18th-century Athonite scholar Neophytos Kavsokalivites. It has in the 20th century become the scholarly orthodoxy that the works, with the exception of one letter, are not the work of Macarius the Great.

The material is voluminous, containing homilies, treatises, letters, answers to questions, and other occasional pieces. It has come down to us in the original Greek in four main collections. Collection I is the largest collection, with 64 *Logoi*. Collection II, the 50 *Spiritual Homilies*, is the best-known recension. Collection III has 43 *Logoi*, Collection IV, 26. There is some overlap between the collections, Collection IV, for example, being contained wholly in Collection I.

The Macarian writings are the collected teachings of the anonymous director of a monastic community of the semi-eremitic type, probably located in eastern Asia Minor or northern Mesopotamia. They may roughly be dated to the 370s and 380s. They are connected with the amorphous ascetic tendency known as Messalianism. The dearth of evidence surrounding the real nature of the Messalian tendency does not allow any crude identification of the writings with that movement. Furthermore, it is clear from the writings themselves that the author was an opponent and reformer of the kind of monasticism later condemned as Messalianism.

The writings may initially have circulated anonymously, ascribed to one Macarius or "blessed one". The addition "of Egypt" may have crept in later. Some material circulated under the name of St Symeon the Stylite, other pieces under that of St Ephrem or, in one instance, of St Basil. Whatever their origins, the writings are a testimony of a spirituality of the highest order.

The master theme of the writings is the vision of the mutual indwelling of man and God. By virtue of his incarnation, God comes to dwell in man and raises man up to dwell in God. The writings are centred upon the heart, the physical and spiritual centre of the human person. With the intellect as governor, the heart reigns over the whole body. It is the vehicle by which grace is experienced by the whole person. The centrality of the heart gives the writings a strongly affective and experiential tone. To illustrate his teaching, ranging from the sheer effort required to acquire the virtues to the highest states of divine contemplation and participation, Macarius uses a host of images and metaphors that give his work an intensely visual and colourful character. The writings are deeply Christocentric, focusing especially on the imitation of Christ. They are also profoundly Trinitarian, and provide the clearest possible picture of man's encounter with God in the Holy Spirit.

Much has recently been made of the Syrian background of the texts. That there is a significant element drawn from the traditions of Syrian asceticism is incontestable. There is also, however, an equally important element drawn from the Hellenic tradition. In fact, much of the interest of the writings stems from their integration of these two very different thought-worlds. Macarius was indebted to the Alexandrine tradition of Clement and Origen. He may have come to know this tradition through the Cappadocian Fathers, with whom he was connected. Macarius develops the concept of *apatheia* (freedom from the passions) inherited from Clement. While he clearly perceives the ontological gulf between creature and Creator, Macarius also works with intuition of the complementarity of the sensible and intelligible worlds that derives ultimately from Plato. The locating of the intellect in the heart does not imply any material restriction upon its activity. Indeed Macarius speaks of the intellect as "rising out of materiality", overcoming the blindness and forgetfulness occasioned by the Fall. Through the gathering of the dispersed and multiple thoughts of the soul into one divine thought by the wings of the Spirit, one comes to "commingle with unoriginate intellect". Macarius' Hellenic culture is a diffused one, mediated by the Alexandrine tradition. It is, however, an aspect that must be taken into account when considering his work as a whole.

Macarius has exercised a profound influence on the development of the Christian spiritual tradition, comparable to that of Evagrius. Echoes of his work are found in the mid-5th-century *Life of Hypatius*. He was certainly known by St Diadochus of Photice, writing in the latter half of the 5th century, and by Mark the Monk (5th century). The *Asceticon* of Abba Isaiah (5th/6th century) shows many affinities with the Macarian writings. St Maximos the Confessor drew upon

the Macarian tradition to balance the traditions of Evagrius of Pontus and Dionysius the Areopagite within his own synthesis. St Symeon the New Theologian is also very much in the Macarian line. By his time the manuscript tradition had settled into the four main recensions mentioned above. The fact that four distinct collections evolved is an indication of an abundant manuscript tradition during the Byzantine period. The 11th-century compilation attributed to St Symeon Metaphrastes is reproduced in the *Philokalia*. It was made on the basis of Collection IV, the oldest of the main Greek collections. The Macarian writings provided an important source for the 13th- and 14th-century hesychasts. St Gregory Palamas cites the "great Macarius" as one of the principal sources for his understanding of the place of the body in the spiritual life and for his teaching on the nature of the light witnessed in prayer. The Macarian writings continued to be popular among both monastic and secular audiences. Their predominantly encouraging tone has led to their being thought especially useful for novices.

Biography

The unknown author of a corpus of monastic writings formerly ascribed to St Macarius the Great. The texts, dating from the 370s and 380s, divide into four collections and probably originate from a monastic community in eastern Asia Minor or northern Mesopotamia. They have been very influential on the development of the Eastern Christian spiritual tradition.

Macedonia

The latest archaeological findings have confirmed that Macedonia took its name from a tribe of tall, Greek-speaking people, the Makednoi (*ma(e)kos* = length). They shared the same religious beliefs as the rest of the Hellenic world but up until the Classical period remained outside the cultural and political development of the southern city states. From the 7th century BC onwards Makednoi, under the leadership of the Temenid dynasty, started to move from the highlands of present Greek western Macedonia to the southeast, initially in the winter pastures of Pieria, expelling, subduing, or assimilating a number of Thracian and Phrygian tribes. By the 5th century the Macedonian kingdom was strong enough to occupy all the lands to the east of the Pindus and to the west of the Strymon river and stretched more or less as far north as the present northern border of Greece. This was achieved through agricultural and military reforms which created an upper class of noble landlords as well as an army of landowning soldiers.

Reform and expansion overlapped with the peak of Athenian domination, resulting in a lengthy period of tension which took many forms. Anxious to exploit rich Macedonian resources, Athens tried to colonize eastern Macedonia, destabilize the ruling dynasty, encourage barbarian invasions, and facilitate disintegration. But it was during the same period of Athenian hegemony that the Macedonian kingdom started to come into closer contact with the southern civilization, Classical art, literature, philosophy, and the Attic dialect. The Macedonian court and nobility, rough and tough pastoralist highlanders, were overwhelmed and easily assimilated into Athenian culture. Even their local dialect, northwestern Greek, was replaced by Attic and left only a handful of written monuments in the form of inscriptions. The presence and work of Zeuxis the painter, Timotheos and Agathon the poets, and, most of all, Euripides secured for Athens what strategy had failed to accomplish: complete and perpetual cultural integration.

Yet "vulgar" Macedonians were not unanimously accepted by "refined" southern Greeks, especially by Athenians, as brethren; occasionally they were classified as "barbarians". This was not due to some latent but still distinguishable Thracian and Paeonian cultural influences or to local linguistic peculiarities. To a certain extent Athenian reluctance could be attributed to the Macedonians' rough manners, their monarchic government, and their delayed appearance on the scene. But the main source of antipathy was more than a century of conflict over eastern Macedonia, Thrace, the Chalcidice colonies, and, of course, the final victorious military involvement of Macedonia in southern affairs from 350 BC onwards, which signalled the end of the Classical period.

Philip II of Macedon was anxious to pacify and unify Greece at any cost – except his own – in order to attack the Persian empire. His dream was fulfilled by his son Alexander III the Great, who in no more than 12 years at the head of a Greek army occupied a major part of the then known world from the Aegean Sea to the frontiers of India. The scientific knowledge derived from his campaigns and explorations was significant. Moreover, the dissemination of Greek culture and language over this vast territory had a tremendous longterm impact on the shaping of the Roman empire, Christendom, and Byzantium. But Alexander's own dazzling personality, his adventures among strange peoples, and his unmatched strategic abilities outlived and overshadowed all his cultural achievements. These achievements became the stuff of popular myths, folklore, literature, ideals, and art among eastern and western

23. The expansion of Macedonia in the 4th century BC

people, and, above all, they nourished the Greek national imagination.

In the short term the kingdom of Macedonia did not survive as long as Macedonian pride. Although Macedonians gained a sense of superiority and abundant wealth from the east, they simultaneously experienced a dramatic demographic haemorrhage of manpower due to the Asian campaign and later on due to emigration to Syria and Egypt. During the wars of Alexander's successors and the Celtic invasion (279 BC) the country also suffered from relentless plundering and war indemnities. Moreover these endless and bloody wars alienated Alexander's generals individually from each other and collectively from the southern Greeks. In less than two centuries (323–148 BC) Macedonia was steadily reduced from a glorious world empire to a Roman province.

In 168 BC the Roman legions dealt a fatal and lasting blow to Macedonian autonomy. Macedonia was stripped of its possessions and was divided into four administrative districts. In 148, after an ill-prepared revolt, it was reunited and officially integrated within the Roman empire. The presence of legions however did not discourage barbarian invasions. It was only between the end of the Roman Civil Wars (31 BC) and the early Gothic raids (later 3rd century AD) that Macedonia enjoyed the benefits of the *Pax Augusta*, and especially the advantages of the Via Egnatia. It was during the same period that its numerous old and new gods made way for the rapid Christianization of the region.

From the early Middle Ages onwards the country suffered numerous barbarian invasions, most of them targeting Thessalonica, which was evolving into a major emporium as the second city of the Christian Byzantine empire. Goths, Alans, Huns, Avars, Slavs, and Bulgars raided, plundered, and occasionally settled in Macedonia. The question of whether the Slav tribes in Macedonia were absorbed or not by the Bulgarians (already Slavicized Huns) will probably never be resolved. Nor will it ever be agreed whether and to what extent these settlers were "Hellenized". There is evidence that some of their warlords were culturally assimilated, but the indisputable fact is that all settlers were Christianized and lived next to various colonists evacuated from the Asiatic provinces of the empire.

Although in the 9th century some Slav settlers were already being employed in the Byzantine army, the 10th century was marked by continuous warfare between Byzantium and Bulgaria, with Macedonia usually being the battlefield. Symeon, Samuel, Peter Deljan, Alousianos, Michael Ivatzi, and the Asen brothers all challenged Byzantine authority and occasionally managed to occupy extensive territories until the mid-13th century. Their defeats by the Byzantine emperors Leo VI, Basil II (the Bulgar-slayer), Michael IV, and Alexios III resulted in the eclipse of the Bulgarian threat and political authority, the archbishopric of Achris (modern Ohrid) – a Bulgarian ecclesiastical institution at the time – being the only remnant.

While the Macedonian hinterland was being devastated, in the urban centres, especially in Thessalonica, Byzantine culture flourished. Various metropolitans of this city are known for their contribution to theology, literature, and law, the best-known being Eustathios (12th century), who commented on Homer, and St Gregory Palamas and Neilos Kabasilas (14th century), both of whom strongly influenced Orthodox theology. Important teachers of Classics and law are also known to have worked in Thessalonica, especially after 1204: John Apokaphkos, Thomas Magistros, Matthew Vlastaris, Constantine Armenopoulos, Dimitrios Triklinios, etc. Even better known are the Byzantine architectural and artistic masterpieces of the so-called "Macedonian school", not only in Thessalonica but also in Kastoria, Serres, Achris, Prespa, Stromnitsa, Melenikon, and especially within the monastic community of Mount Athos, established officially in the 10th century. The presence of Slavs in Macedonia is related in particular to two important cultural developments: the "Miracles of St Dimitrios", the patron saint of Thessalonica, i.e. rhetorical ecclesiastical accounts recalling the 7th-century sieges of Thessalonica and the early Slav–Byzantine contacts; and the work of two Byzantine brothers from Thessalonica, Constantine (Cyril) and Methodios, who in the 9th century became the apostles to the Slavs and inventors of the Cyrillic alphabet, initially used for the translation of religious texts.

The threat from the north was not the only problem for medieval Macedonia. The Arabs (Saracen pirates) looted Thessalonica in 902 and the Normans, who invaded from the west, in 1185. Macedonia was also invaded by the crusaders in the early 13th century, the Albanians, and Catalan mercenaries, and it became part of the short-lived Serbian empire of Stephan Dushan (1334–55), amid Latin and Byzantine dynastic clashes which lasted into the 14th century and paved the way for the Turks. By the early 15th century Ottoman rule had been imposed over all Macedonian territories including Thessalonica. It was not to be interrupted for more than five centuries.

Throughout the Byzantine period Macedonia was never a separate administrative region. In fact the name Macedonia was assigned to a Byzantine administrative unit (theme) in Thrace and the imperial Macedonian dynasty originated from Adrianople. The term had lost its former geographical and other implications. The same is true for the Ottoman era. After the Ottoman settlement and the sporadic Islamization of Christians and Jews, Macedonia was not only an ill-defined region but also a linguistic mixture of Greek-, Slav-, Turkish-, Albanian-, and Vlach-speaking Christians and Muslims, as well as Spanish-, Greek-, and Turkish-speaking Jews. In such a multilingual milieu and under the Islamic law linguistic differences were entirely meaningless. In fact, these differences were related more to the cultural division of labour than to the actual origin of the people. As a rule, for example, Christian peasants were Slav-speakers, shepherds Vlach-speakers, traders Greek- and Vlach-speakers. All Christians shared a post-Byzantine culture which was determined by Orthodox dogma and nourished by Byzantine legends. They were mainly loyal to their family, clan, and community and had little sense of ethnic distinction. Alexander the Great, whose adventures were the topic of a well-known Greek folk song (*rimada*) and a booklet (*fyllada*) – a version of Pseudo–Callisthenes popular in Byzantium – was probably the only figure from antiquity to have survived medieval illiteracy and Christian anathema. He and his royal family were to be recalled from the past to participate in yet one more Hellenic expedition in the 18th and 19th centuries AD.

A Christian merchant class was shaped in the context of the unbalanced European-Ottoman commercial relations. In southern Greece they were Greek- and Albanian-speaking shipowners. In Macedonia they were Greek- and Vlach-speaking merchants. The Vlach-speakers, from the 18th century onwards, slowly descended from the highlands into Macedonian towns. They had secured the necessary capital, family network, and connections among the *armatoloi* (border guards) and brigands to pursue trade between the Ottoman Balkans, the Habsburg domains, and western Europe. Merchants replaced what was left of the Byzantine aristocracy in Macedonia and became the urban class, flattered by the romantic revival of Hellenic culture, strongly attracted by Greek education, and proud to choose for their offspring the names of Alexander's generals.

Such merchants and chieftains at the head of various pastoralists and peasants, who had hoped that liberation from the Turks would also bring economic emancipation, participated eagerly in the Greek War of Independence (1821–32) as well as in various Greek revolts throughout the 19th century after Greek independence. It was all to no avail in spite of a heavy toll paid in blood. After 1870 the Greeks did not possess the monopoly of irredentism in Macedonia. The establishment of the Bulgarian Church (exarchate) and the creation of an independent Bulgarian principality (1878) provided a second option. As the Eastern Question entered its final stage, it was evident that the Macedonian heritage would belong to that state which could argue most convincingly in front of the Great Powers for its demographic and historical rights in that region.

Vigorous educational campaigns were launched from Athens and Sofia and to a lesser extent from Belgrade to enlighten their brethren in Macedonia and bring them up to date with their respective nationalisms; but not surprisingly such ideologies were not easily absorbed by the agrarian societies which were so badly needed to affirm demographic supremacy. Greeks had the copyright of Macedonia's ancient history which they exploited as best as they could. After the schism of the Bulgarian Church from the Ecumenical Patriarchate (1872) they also had the advantage of shared religion with the target population. But linguistic arguments were in favour of the Bulgarians, who were also helped by Samuel's medieval legacies and, most of all, by various social and economic cleavages which fed back to Bulgarian nationalism: the word "Bulgars" had become synonymous with illiterate peasants, heavily taxed by the Church and the state, scorned and exploited by the mercantile class. It was only natural that some of them opted for the exarchate.

The peak of Bulgarian intervention in Macedonia was the Ilinden Uprising (1903) which failed to bring a Bulgarian-sponsored autonomy but did bring the Greeks into the game anew. Educational and ecclesiastical antagonism soon resulted in an undeclared and bloody Graeco–Bulgarian war of bandits (1903–08) in what was still Ottoman–held Macedonia, fought to win or to reverse national allegiances. European involvement, aiming to secure temporary tranquillity through finan-

Macedonia: rally in Thessalonica on 14 February 1992 protesting at the use of the name "Macedonia" by the former Yugoslav republic

cial reform, failed to produce any permanent result. It helped, however, to standardize the term "Macedonia" as identical to the three Ottoman prefectures under reform, thus stretching the region's northern limits further than Philip and Alexander had done, as far north as Tetovo and Kumanovo. It was that expanded Macedonia which was divided in 1913 at the end of the Balkan Wars between Greeks (51 per cent), Bulgarians (10 per cent), and Serbs who, though latecomers, took 38 per cent, taking full advantage of Stephan Dushan's titles and their own war efforts.

In the following years voluntary and compulsory population exchanges between Greece, Bulgaria, and Turkey were intended to pacify the region by achieving ethnic homogeneity. This was not always an easy task in Greek and Bulgarian (Pirin) Macedonia; nor was it the same as the acculturation policy implemented by Belgrade in Serbian (Vardar) Macedonia. The integration of the three parts into their respective nation states, occasionally under absolutist regimes, sometimes revived previous loyalties or even created new ones. Slav Macedonian ethnic identity in particular is the interwar product of an interaction between Bulgarian revisionism, Balkan Communism, Serbian and Greek centralization, and colonization policies. During World War II, the Greek Civil War, and the postwar period, Macedonian identity and nationalism became an important lever to neutralize Bulgarian aspirations in the Yugoslav Socialist Republic of Macedonia, to avoid Serbian colonization, to maintain some grip on the Greek part of Macedonia, and also to gain influence in the large and multiethnic Macedonian diaspora.

The shaping of this latest of all Balkan nationalisms followed the same recipe: ancient ethnic roots and ethnic continuity are indispensable for the survival of a nation state. It was too difficult a task for historians in Skopje to achieve but not an entirely unsuccessful venture. They continue to lack the consent of their Greek and Bulgarian colleagues, who safeguard the respective traditions of ancient Macedonia, the medieval Slav kingdoms, and anti-Turkish revolts as their own precious heritage. In Greece the Greek Macedonian heritage has been enriched by two generations of national heroes who fought against the Turks in the 19th century and the Bulgarians in the early 20th, in the so-called "Struggle for Macedonia". The establishment in 1991 of an independent replublic (the Former Yugoslav Republic of Macedonia) in place of the Yugoslav Socialist Republic of Macedonia intensified antagonism for the past and strengthened the importance of symbols. Even though the diplomatic aspects of the modern Macedonian Question are not beyond solution, a compromise over the legacy of Alexander for the Greeks and Tsar Samuel for the Bulgarians is highly improbable as long as Macedonian history and Balkan politics are analysed in ethnic terms.

BASIL C. GOUNARIS

Summary

Ancient Macedonians shared the same religious beliefs and language as the rest of the Hellenic world but had remained politically distinct. Expansion and reform in the 5th century BC coincided with Athenian hegemony and resulted in conflict and Macedonian domination of southern Greece in the 4th century BC. By 148 BC Macedonia was a Roman province. Throughout the Middle Ages it suffered numerous invasions but also evolved into a centre of Byzantine culture. In the 19th century, after five centuries of Ottoman rule and considerable demographic change, Macedonia became a focus for the Greek nationalist cause, and its borders were redefined by various conflicts. Its position in the central Balkans has made it an apple of discord between Greece, Bulgaria, and Yugoslavia since the late 1940s.

Magic

In one form or another, magical beliefs and rituals have always found a place in the Greek tradition, although it must be said that magic, as a distinct and easily recognizable category, is one no longer readily accepted by modern scholarship. For the sake of the present discussion, however, and while acknowledging the considerable debate on the topic, it may be understood in the present context to indicate that end of a continuous and largely undifferentiated spectrum of religious thought and behaviour deemed unacceptable to the dominant culture at any given period because of the purposes for which it is employed, because of the methods and the powers it is believed to use, and because of the assumptions it makes about the nature of the cosmos.

The ancient Greek religious tradition included a vast array of magical techniques through which it was believed that people could attain material enrichment and success; could protect themselves against misfortune, ill health, and malice; could discover normally hidden information; or could cause those they wanted to love them and those they hated to suffer or die. Indeed, it seems likely that most people's religious beliefs and practices contained much that may be categorized at the magical end of the spectrum. In an atmosphere of general uncertainty, insecurity, and helplessness, magic claimed to provide a method that worked directly and relatively dependably to solve all the problems, difficulties, and unfulfilled aspirations of everyday life.

Firm evidence of belief in magical power and practice goes back to the earliest Greek literature, although this undoubtedly represents a far older tradition in prehistory: Circe, in Homer's *Odyssey*, for example, knows how to summon spirits of the dead and uses magic rituals to transform humans into animals, while in myth Medea possesses the power of the evil eye and can cause all manner of harm by magical means. Important references to magical practices and beliefs are found in literature from the entire span of ancient Greek culture, for example in Hesiod, Plato, Aristotle, Theocritus, Apollonius of Rhodes, Plutarch, Lucian, Plotinus, and Iamblichus. Knowledge derived from this material is supplemented by archaeological artefacts, in particular curse tablets, figurines, and amuletic gemstones. The most detailed information concerning magic in the older Hellenic tradition comes, however, from the Greek magical papyri that originate in Egypt and date between the 2nd century BC and the 5th century AD. This very rich collection of material demonstrates clearly that the Greek tradition of magic cannot be taken in isolation from the Egyptian, Jewish, and other near Eastern traditions, and confirms that magic was practised at many different levels, from villages to courts, and by practitioners ranging from itinerant to highly institutionalized individuals.

The magic revealed by these sources is primarily concerned with using the supernatural forces believed to control and influence the world in which humans exist, whether these are gods and goddesses, intermediary powers such as angels, demons, and decans, or spirits of the dead. Those associated with nature, such as solar and astral powers, feature prominently, while in the papyri, with their particular cultural context, the Jewish god Iao is most frequently named; but in general the forces of the underworld (notably Hecate) were undoubtedly those thought most helpful and potent. Magical practice, ranging from the crude and casual to the elaborate and formal, was thought to be empowered in almost all cases by a combination of speech and ritual action. Although sometimes no more than vestigial at a low level, these words and actions, which often involved overt symbolic linkage to the desired outcome, were underpinned at the most complex end of the scale by a vast system of knowledge of numerous levels of often highly individualized supernatural powers, and of the names, words, and practices to make them responsive or submissive. It was vital to know all the natural materials (animal, vegetable, or mineral) thought to be particularly favourable or potent in relation to the purposes of the magic in hand and either sympathetic or antipathetic to the powers being used; important too was knowledge of correct timing (generally determined by complicated astrological lore) and location (e.g. a crossroad or a place of violent death). Just as most people today, however, use modern technology with almost no knowledge of the underlying scientific theory, so most who employed magical techniques in the ancient world had no real understanding of their formal and complex intellectual basis.

For the purposes of analysis, magical practice in the Greek tradition may be said to fall into one of three general cate-

gories: protection, manipulation, and the discovery of normally hidden knowledge. For protection, amulets were most commonly used. These operated at all levels from individual to communal and were either worn on the body or placed strategically, on the doorpost of a house, for example, or on a city gate. All manner of materials were used, but all were thought to have some special apotropaic efficacy, whether physical or symbolic; this might be increased by combining elements, by adding written formulae, and by preparing them at the proper time and place.

Best known among the enormous range of popular techniques of magical manipulation, particularly for ill, is the use of curse tablets and "voodoo dolls". In the former case imprecatory and magical formulae were most often inscribed on a lead tablet that was then associated with the enforcing powers by, for example, being inserted in a tomb or buried at a crossroads. The tablet was also frequently "bound" or "fixed" symbolically during the ritual, perhaps being tied with elaborately knotted thread, or pierced with a nail. Practices involving magical figurines were generally similar, although wax or clay might be used and rituals of piercing and binding were often more complicated; symbolic melting or severing of the image might occur and it might be associated with the victim by using personal materials (hair, nail clippings, etc.) and by inscribing personal names on specific body parts. In both cases ritual action was carefully timed and located and was accompanied by equally elaborate verbal elements. Such practices were believed to cause general loss of performance (e.g. in oratorical skill or reproductive capacity), illness (physical or mental), overwhelming lust, or even death; these effects might extend not only to humans but to livestock and crops as well. Other manipulatory techniques involved summoning and then compelling supernatural powers or spirits; in their more elaborate forms complex rituals of invocation took place and interaction with the powers might be thought to occur in a trance state or by means of visions seen, perhaps, in the shining surface of a vessel of water or a mirror. The latter practices relate closely to some used for determining hidden knowledge (see the article on Divination). Also related to these manipulatory techniques are the late antique rites of theurgy.

The emergence of Christianity and its rise to a position of cultural dominance in the Greek world certainly had a major effect on the concept and practice of magic, but it by no means eliminated it. Due to the monotheistic and supplicatory nature of the Christian religion, almost all pagan practices that survived tended to be condemned as magical by the Church authorities because their attitude was implicitly coercive and because they were seen as employing evil powers. Many very common elements of religious practice in the ancient Greek tradition, such as sacrifice, divination, and the use of amulets, were thus now shifted to the magical end of the religious spectrum by Christian doctrinalists, but, although some of these dwindled significantly in the public sphere, there is abundant evidence that they still continued to play an important part in popular and private belief and practice at all social levels. Many of the ancient magical practices, considered above, continued, while many outwardly Christian practices that were employed for culturally unacceptable ends or in ways that conflicted technically with Orthodox principles might also now be viewed as magical: making offerings to images of holy figures, for example, in the belief that they might be coerced into providing a guaranteed response, wearing Christian symbols as amulets in the belief that automatic protection would result, or believing that evil spirits could be controlled for personal ends by the use of Christian words of power and sacred materials. Defined in these terms, then, religious activity deemed to be magical may actually be said to have increased during Christian times; indeed, the new religion itself brought to the centre of the Greek tradition some Middle Eastern notions of magic that had previously been recognized only on its fringes (e.g. techniques of exorcism), and some passages in both the Old and New Testaments did nothing to undermine belief in the efficacy of magic. It remains true, however, that the notion of magic in the Byzantine and modern Greek world is an essentially artificial one imposed both by contemporary Christian doctrinalists and by modern scholarship. It is clear that most ordinary people, untrained in theology or uncommitted to its finer points, have seen magic simply as an alternative way of attaining results when the recourse to the normal routes offered by standard Christian practice has appeared to be inappropriate or to have failed.

Ancient magical techniques were still employed throughout the Byzantine period and down to the beginning of the 20th century in almost exactly the same forms and contexts as they had been in antiquity. There was something of a decline in the use of curse tablets and undoubtedly there was an increase in the Christian content of many of the rituals and verbal formulae, but most practices remained substantially unchanged: take, for example, amuletic inscriptions against the female spirit believed to cause sudden infant death (Gylou or Yello in the later tradition); the consultation or conjuration of spirits in vessels of water; the concept of "binding" or "fixing" enemies and rivals; or belief in the evil eye (see the article on Evil Eye).

In the Christian period the notion of "witchcraft", where the human operator of magic is believed to possess inherent supernatural power, is almost totally absent from the Greek tradition, with the notable exception of the evil eye; instead, almost all Greek magic is, technically, "sorcery", consisting of learned techniques passed on in a verbal or literary tradition. Detailed evidence of this tradition occurs first in the magical papyri and other works, such as the *Testament of Solomon* and the *Kyranides*, dating from the early Christian era, but it reappears, in a clearly recognizable form, in manuscripts of magic dating from the 15th to 19th centuries. Versions of these works, known popularly in the modern tradition as *solomonaiki*, continued to be published to the present day.

During the 20th century there was certainly a significant decline in recourse to magic in the Greek world but it persists to an extent. Practices associated with belief in the evil eye are still widely attested, as are some forms of divination, although neither appears to be taken as seriously by many people as they once were. The use of amulets in one form or another is also still widespread and some of the old apotropaic symbols may occasionally be found displayed in public places (on the dashboard of a bus, for example, or over the window of a house). Some people still apparently believe that sorcerers exist and they attribute to them many of the old techniques derived from the written tradition – binding, cursing, causing uncontrollable love, divining by means of evil spirits, and so on – but recent anthropologists have been unable to find either such people

themselves or individuals who have personally visited them, and have thus expressed doubts over their continued existence. What does unquestionably continue, however, is an attitude to religious practice that falls at the magical end of the scale in the sense that "automatic" results are believed to be attainable through otherwise standard Orthodox Christian practices.

Magistrates

The monarchic political system of Mycenaean Greece was largely superseded during the Dark Age, the powers of the kings being redistributed among various magistrates (*archai*). As so often, our main evidence comes from Classical Athens, though the sheer size of the city makes it wholly exceptional in its great range of offices. A figure of 700 internal offices (*endemoi archai*) and a corrupt figure of 700 external ones (*hyperorioi archai*) are given for the 5th century BC by the *Constitution of Athens* (24.3), the second half of which (chapters 43–62) comprises a summary of the 46 main magistrates and boards of magistrates (adding up to a total of about 320 officials). These include financial officials, various sortitive annual officials, the archons, the quadrennial *athlothetai* (officials responsible for the Panathenaea festival), elective and military officials. As many as 71 different magistracies and boards are attested in the sources, adding up to some 450 magistrates (excluding the council, or *Boule*, of 500).

Various laws defined the basic criteria for magistrates at Athens: they were chosen by election or lot; they underwent a preliminary examination (*dokimasia*) before entering office; they served for at least 30 days; and they rendered accounts (*euthynai*) at the end of their term. In addition there was a minimum age-limit of 30; and all *archai* swore an oath that they would carry out their duties properly and in accordance with the laws. Magistrates regularly served for a period of one year only and in many cases were not eligible for a second term. Those in oligarchic states were chosen from the wealthiest citizens, but at Athens, after a long process of development, eligibility was extended to all four of the Solonian property classes, though formally only members of the first three classes were eligible for office even in the 4th century. Another contrast between oligarchic and democratic states was that magistrates in the former exercised real power, whereas many of those in the latter were essentially administrators, and all were subject to the will of the popular assembly. Magistrates summoned and presided over meetings, prepared the agendas and put motions to the vote, and most importantly executed the decisions of the assembly. To this end they had legal protection and the power to impose small fines on those who resisted them.

The administration of Athens was not hierarchical in structure (though some posts carried far greater prestige than others), and the great majority of magistrates were selected by lot from candidates who volunteered themselves. Sortition was a mark of the radical democracy; in moderate democracies and oligarchies election was the norm. At Athens, going by the figure in the *Constitution of Athens*, some 1100 magistrates were chosen by lot every year (including the 500 members of the council), and about another 100 were elected, from a pool of about 20,000 citizens over 30. This involved a heavy commitment on the part of Athens' citizens, especially since it was forbidden to hold the same sortitive office twice, except in the case of the council (where a man could serve twice but not in successive years). They could, however, be selected for different offices, and in theory, at least, they might therefore serve every other year (since they had to pass their *euthynai* after office before holding another position). The literary sources indeed suggest there was plenty of competition for office, though inscriptional evidence indicates that not all boards of magistrates were always filled, again with the exception of the council. The ten generals (*strategoi*), the most important financial officials and other officials such as the superintendent of the water supply (*epimeletes ton krenon*) were among the 100 or so magistrates who were directly elected, regularly after being proposed by another and with or without their consent. A check on individual power in democracy existed in the form of collegiality – all members of a board of magistrates were equal.

With this mixture of selection by lot and election it was inevitable that the elected officials tended to wield the most power. Down to the 5th century the leading Athenian magistrates were the nine archons. Three archons had taken over the powers of the kings: the *basileus* (who performed religious duties), the eponymous *archon* (the civilian head of state), and the *polemarchos* (who commanded the army); and alongside these were the six *thesmothetae* (judicial officials). At some point a secretary of the *thesmothetae* was added, so that the archons formed a board of ten (ten or a multiple of ten being the regular figure for boards after Cleisthenes reorganized the citizens into ten tribes). But the power of the archons waned after 487/86, when the method of sortition from an elected short list was introduced, and as the 5th century progressed their place at the head of Athenian politics was taken over by the ten generals. The archons' position declined still further when sortition replaced election at the first stage of selection as well, and in the late 5th and 4th centuries the archons performed mainly religious and judicial functions. However, the power of the generals also declined in the 4th century, as civil magistrates took over the leading role.

Magistrates at Athens were paid in the 5th century, but payment was abolished in 411, except for the archons and members of the council. Overseas officials, who included *archontes*, *episkopoi* ("overseers"), and garrison commanders, were also paid.

The civil magistrates at Sparta, and in several Dorian states, were called the ephors ("overseers"). The annually elected board of five ephors wielded considerable executive, judicial, and disciplinary powers, among them the right to control the conduct of the two kings. Evidence exists for the survival of the ephorate until at least the 3rd century AD.

In the Hellenistic period, although democracy was espoused and new cities were established with a council, assembly, and magistrates, as also was the revamped Achaean League of the early 3rd century BC, the balance of power very definitely shifted towards the wealthy. The kings paid professional magistrates, and there were numerous high- and low-ranking officials. The former tended to be Macedonians and Greeks, the latter natives, though by the 2nd century BC natives were beginning to rise to higher office.

Despite the advent of Roman rule, much responsibility was left to local communities. The power of the wealthy was consolidated by the institution of wealth qualifications for office, and to the end of antiquity the cities of the Roman empire tended to be ruled by local magistrates. Under the empire the main provincial officials were called "generals" (*strategoi*), as military titles frequently lost their military connotations. Police and judiciary officials were called "praetors", a title given from the end of the 10th century AD to the civil administrator of a province. From the 9th century various officials were called the *katepano*, who might be the commander of a military unit, and by the end of the 10th century this term was used of the governors of major provinces, who were also called *doux*. The "quaestor of the sacred palace" (*quaestor sacri palatii*), a post created by Constantine I, drafted imperial laws and heard petitions addressed to the emperor, and as the emperor's adviser in legal matters wielded considerable influence until the 9th century. Constantine also created the post of "master of the offices" (*magister officiorum*), as a check on the power of the Praetorian Prefect, the commander of the emperor's bodyguard who from the 4th to 7th century would be an important regional civil official. The *magister officiorum* was the head of the civil administration in the late empire and a powerful figure at court, but again the importance of this official waned from the 7th century. One other important group of officials was the college of twelve *kritai tou belou*, who operated from the 10th to the beginning of the 13th century in Constantinople. These judges were so named because they met behind a curtain (*belon*; Lat. *velum*) at the Hippodrome.

Magna Graecia

"Magna Graecia", the Latin translation of the Greek *Megale Hellas*, was the conventional name for the Greek colonies in southern Italy, which were to provide Rome with its first contacts with Greek culture. The term first appears in 5th-century BC writings and is used to refer to the Greek world as a whole. The earliest instance of its use to indicate the Greeks of Italy is in Polybius (2. 39. 1), writing in the 2nd century BC but referring to the banishment of the Pythagoreans and subsequent formation of the Italiote League by Greek cities in the region of Italy which was known as *Megale Hellas*. By the 1st century BC the name was in common usage among Greek and Latin authors and referred to the territory stretching from Cumae near Naples in the north to Tarentum (Greek Taras) in the south, but excluding Sicily.

The first western Greeks came from Euboea where the chief cities were Chalcis and Eretria, and their first colonial foundation was Pithecusae on Ischia in the bay of Naples. The site of Pithecusae is at the northwest extremity of the island, the acropolis being Monte di Vico, with the cemetery in the adjacent Valle San Montano and beyond it on the Mezzavia hill, a suburban area. Excavations began in 1952, under the direction of Giorgio Buchner. The best-known find is the so-called "Nestor Cup", a drinking cup of Rhodian manufacture placed around 720 BC in the cremation grave of a boy about ten years old. The cup bears a three-line retrograde inscription in the Greek alphabet of Chalcis, the second and third lines of which

are hexameters, and it reads, "Nestor had a fine drinking cup, but anyone who drinks from this cup will soon be struck with desire for fair-crowned Aphrodite." This is one of the earliest examples of the Greek alphabet, and the only surviving excerpt of Greek verse from the period when the Homeric epics made the transition from oral to written poetry. Scraps of Phoenician inscriptions have also been found, indicating that Pithecusae's population included Phoenicians; indeed David Ridgway has suggested that the boy whose grave yielded the "Nestor Cup" may have been of Levantine extraction. Buchner thought that these Levantine residents were not merchants, but rather artists and craftsmen commissioned by the Greeks to work in the orientalizing style.

According to Strabo, the Eretrians and Chalcidians at Pithecusae quarrelled, which may be a reflection of the hostilities between their mother cities, and the Eretrians left. In any case, the first foundation on the mainland was Chalcidian, at Cumae, opposite Ischia, some 20 km west of Naples. The site has a steep acropolis and good farmland nearby, but no harbour, though it has been suggested that an ancient harbour may have silted up. The pottery from the earliest Greek tombs at Cumae dates to shortly before 725 BC and the colony's foundation date is probably slightly earlier. The site's chief attraction was its proximity to the markets of central Italy which bought not only Greek manufactures but objects from Syria and Phoenicia. Parthenope, on the site of Naples, and Dicearchia, Roman Puteoli (modern Pozzuoli), founded between Naples and Cumae (*c.*530 BC) by Samians fleeing the tyranny of Polycrates at home, were both within the Cumaean orbit. Chalcidians from Zancle (modern Messina) along with emigrants driven by famine from Chalcis and Messenians from the Peloponnese also founded Rhegium (modern Reggio Calabria), thereby consolidating the Euboean grip on the trade route up Italy's west coast.

24. Greek colonies in southern Italy

The instep of Italy first attracted the Achaeans from the northwest Peloponnese, who founded Sybaris *c.*720 BC, which commanded a fertile plain as well as a good commercial location, for it was the southern terminus for an overland route to the Tyrrhenian Sea, and was well placed to profit from the east–west trade route along the south coast of Italy. The city's wealth was famous; so also was its utter destruction by its neighbour Croton (modern Crotone) in 510 BC which diverted the river Crathis over the site. The city was refounded in 443 BC as Thurii by Athens, although the colonists were a Panhellenic group which included the historian Herodotus. Croton, founded about 710 BC, commanded a fertile but smaller agricultural area as well as a small double harbour. The philosopher Pythagoras migrated there when his homeland, Samos, fell under the tyranny of Polycrates, and founded a brotherhood which supported oligarchic government and was driven out by a popular uprising in the mid-5th century BC. Croton in turn founded Caulonia (modern Monasterace Marina) on the south shore of the toe of Italy. The earliest pottery found there dates to the early 7th century BC, but nothing indicates extensive settlement before the mid-6th century. Some 9.5 km southwest of Caulonia, at Capo Colonna, is the temple of Hera Lacinia of which a single column and some foundation blocks remain. It was the meeting-place of the Italiote League until it was dissolved by the tyrant of Syracuse, Dionysius I, when he invaded Italy in the 390s.

Another Achaean foundation was Metapontum (modern Metaponto), some 48 km west of Taranto. Its sanctuary area, marked off by a circuit wall, contains ruins of temples (A, B, C, D, and E), the largest of which (temple A), dedicated to Lycian Apollo (580 BC, reconstructed 530 BC), yielded the first examples of polychrome terracotta revetments which are a feature of Archaic temple rooftops in Magna Graecia. North 3.2 km from Metaponto is the so-called "Tavole Palatine", a temple of Hera (6 × 12 columns) built about 500 BC on a low hill where there had been a native settlement. Five Doric columns on the south side and ten on the north remain standing. The last major Achaean site was Posidonia (later Paestum, modern Pesto), which was founded by Sybaris on the coast of the Tyrrhennian Sea some 80 km southeast of Cumae. The site has three well-preserved temples, the mid-6th-century "Basilica" (actually a temple of Hera), the so-called "Temple of Neptune" a century later, which was also a Heraion, and the "Temple of Ceres" (late 6th century) which was probably dedicated to Athena. The area was a centre for the worship of Argive Hera, as is suggested by the discovery of a sanctuary at the mouth of the river Sele, 13 km distant, with several temples and treasuries, the largest of which was a Heraion, a Doric building of 500 BC or slightly earlier. The sanctuary must date before the late 7th century BC, for Corinthian pottery of that period has been found there.

In the 670s Locris in central Greece founded Locri Epizephyrii on the east coast of Calabria. The earliest remains have not been found, but in the Classical and Hellenistic periods Locri, sited between the coastline and the hills of the interior, grew into a city covering 230 hectares, protected by a wall 7.5 km long. But the city which maintained its independence from Rome longest was Taras, or Tarentum, to give it its Latin name, remains of which lie beneath modern Taranto on a fine peninsular site with an superb harbour. Tradition told that it was founded in 706 BC by *parthenioi* from Sparta who were the bastard offspring of helots and Spartan women begotten while the Spartan army was away suppressing the revolt of Messenia. It suffered a calamitous defeat *c.*473 BC at the hands of the native Messapians, the worst defeat ever suffered by a Greek army, according to Herodotus (7. 170), but it recovered to become physically the largest city in Italy a century later, and leader of a revived Italiot League. Taras in turn, together with Thurii, founded Heraclea (433/32 BC) west of Metapontum, which marked the rebirth of the only Ionian settlement in the area, Siris, which had been destroyed in the mid-6th century by its Dorian neighbours Metapontum, Croton, and Sybaris. Siris had been founded about 650 BC by refugees from Colophon in Ionia, fleeing from the Lydians. A steep hill with a flat top at modern Policoro, the site of Heraclea, has yielded evidence of a great mudbrick wall of shortly after 700 BC, and this may mark the location of Siris. The last south Italian colony was Elea, Roman Velia, founded *c.*535 BC on Posidonian territory by Phoceans from Asia Minor after they had lost their city to the Persians. Elea was to produce one of the most rigorous Presocratic philosophers, Parmenides, the founder of the Eleatic school.

By the 4th century Oscan-speaking Sabellian people were filtering south into Apulia, Lucania (modern Basilicata), and Bruttium (modern Calabria). They captured Cumae in 421 BC, expelling or killing most of the Greek inhabitants, and 11 years later they took Posidonia, renaming it Paestum. Naples admitted its Oscan inhabitants to the citizenship and perforce allowed them a share of political control, but it remained substantially a Greek city. Elsewhere, the foray of Dionysius I in the 390s meant that Croton, Caulonia, Rhegium, and Locri fell under the rule of Syracuse and were garrisoned by Syracusan troops for 12 years before they could eject them. Taras escaped Dionysius' aggression, however, and in the 4th century ranked as the chief city of Magna Graecia, a distinction owed in part to its leading statesman, Archytas, a Pythagorean philosopher who was a friend of Plato and intervened to deliver him from house arrest when he made his second visit to Syracuse with the vain hope of making Dionysius II an ideal statesman.

The threat from its Italic neighbours spurred Taras to bring in a series of *condottieri* from Greece. A Spartan king Archidamas campaigned with some success in 343–338 BC. Alexander the Great's brother-in-law, Alexander I the Molossian from Epirus who arrived in 334 BC, achieved more, and even made a treaty with Rome, but his personal ambitions made him suspect and the Greeks were relieved when he was killed in battle in 330 BC. His territorial gains were lost after his death. The most famous of these generals was Pyrrhus, also from Epirus, who arrived with 22,500 infantry, 3000 cavalry, and a corps of 20 Indian war elephants. He won two victories at Heraclea and Ausculum over the Romans, which cost him heavy casualties and made the term "Pyrrhic victory" a byword. Then, failing to make a peace treaty with Rome, he abandoned Italy at the invitation of Syracuse to campaign in Sicily against Carthage. He returned with a reduced force in 275 BC for a last battle against Rome at Malventum (later Beneventum) where he was outnumbered and suffered a decisive defeat, after which he left Italy for good. Tarentum, as it was henceforth, held out three more years before Rome conquered it. By then the other city states of Magna Graecia were already allies of the Roman people, and, since most were ports and commanded forests in their hinterlands, they formed the nucleus of Rome's naval allies.

Rome had early connections with Magna Graecia. It learned the Chalcidian Greek alphabet from Cumae, and developed the Latin alphabet from it. It may also have learned the name "Graeci" (i.e. "Greek") there as well, for among Cumae's original settlers was a contingent of *Graioi* from a small state in eastern Boeotia. Tradition also connects early Rome with the Cumaean Sibyl whose cave was discovered in 1932, for Rome preserved a collection of oracles called the "Sibylline Books" in the temple of Capitoline Jupiter until it was burned in 83 BC; these had been sold by the Sibyl to Tarquinius Priscus, an Etruscan king of Rome. Livius Andronicus (*c.*284–204 BC), whose translation of the *Odyssey* into Latin marks the beginning of Roman literature, was probably a Tarentine Greek who was taken to Rome after the capture of Tarentum in 272 BC. But Magna Graecia did not enter the Roman imperial orbit until the Second Samnite War when a Roman army besieged Naples (327/26 BC) which was surrendered by a pro-Roman group in the city, and signed a treaty of alliance on very favourable terms. By the 290s Rome's web of alliances stretched into Lucania and Apulia and cities which had supported the Samnites were conquered. Velia was taken in 293 BC. At Paestum a Latin colony was installed in 273 BC, and a forum, complete with a temple of Jupiter Capitolinus, was cut into the middle of the city plan. The fall of Tarentum and the peace treaty that followed probably mark the end of the Italiote League. However, when Hannibal invaded Italy and defeated Rome disastrously at Cannae (216 BC), Tarentum, Thurii, Croton, Locri, and Metapontum, all leading members of the old Italiote League, went over to the Carthaginians, while further north the alliances remained firm. Cumae, which had held the status of Roman "citizenship without the vote" since its capture by Rome in 334 BC, resisted all pressure to defect, and the alliance with Naples remained firm. In the south, however, only Rhegium remained a loyal ally.

Details of Rome's settlement of Magna Graecia after Hannibal's defeat are scant, but Tarentum, which had been sacked in 209 BC, was put under military government for a couple of decades after the war. Croton and Thurii received colonies. A good deal of land was confiscated, and became *ager publicus*, land owned by the Roman people, much of which was to be allotted to Roman settlers by the Gracchi brothers, and later by Pompey and the emperor Nero. The Social War between Rome and its allies in the early 1st century BC marked the end of the Greek cities as nominally free states: after 89 BC they formed part of the Roman state either as colonies (*coloniae*) or municipalities (*municipia*). The final act

came with the emperor Augustus who divided Italy into 11 regions. Magna Graecia was broken up among three regions and lumped together with its ancient enemies, the Sabellian peoples.

But that was not quite the end. In the years after Hannibal's defeat, the interest of Rome's elite in Greek culture increased rapidly along with its wealth, and villas sprouted around the bay of Naples. Greek culture, however, now flowed for the most part directly from Greece and not through the medium of Magna Graecia. In the Byzantine period there was one last flowering of Greek culture, centred particularly in Calabria. Under Justinian (AD 527–65) the Roman empire, as it still considered itself to be, recovered Italy from the Ostrogoths, but lost most of it to Lombard invaders shortly after Justinian's death. Constans II (641–68), despairing of Constantinople, decided to move his capital west, and in 663 landed at Tarentum and pushed the Lombards back to Beneventum, which, however, he failed to take. After his assassination, the Lombards retook most of Apulia. Arab raids on Sicily and Italy also intensified; Palermo fell in 831, and following that, the Arabs took Bari and Tarentum, and left Byzantium with little more than Calabria. Under Basil I (867–86) and Leo VI the Wise, (886–912) of the Macedonian dynasty, the Byzantines riposted: Apulia was retaken, and Leo VI established two themes in Byzantine Italy, Longobardia ruled by a military governor at Bari, and Calabria ruled generally from Reggio (Rhegium). By the end of the millennium, Byzantine power in what used to be Magna Graecia was paramount and was not seriously challenged until the advent of the Normans. Robert Guiscard's capture of Bari in 1071 extinguished Byzantine rule

This last flowering saw Greek replace the Latin language in Calabria and, less throughly, in Apulia. The Greek Church replaced the Roman Church in the south, though in Naples there was a lively contest between the Greek and Latin hierarchies. The Basilian monasteries of Calabria offered shelter to Greek monks migrating from Arab Sicily and became centres of Byzantine culture. St Neilos of Rossano (*c.*910–1004) in particular was a talented hymnist and brought fame to his monastery in the Merkourion district. The Norman conquest did not terminate Greek influence immediately, but with the capture of Bari a chapter was ended.

Summary

Magna Graecia (*Megale Hellas* in Greek) was the conventional term for the Greek colonies of southern Italy but excluding Sicily. Colonization began in the 8th century BC. The settlements provided the Romans with their first taste of Greek culture. By the 1st century BC all the cities were absorbed into the Roman state, but Greek culture persisted. Magna Graecia was recovered by the Byzantines and not finally lost until 1071.

Makarios III, Archbishop 1913–1977

President of Cyprus

Archbishop Makarios III, president of the newly independent Republic of Cyprus from 16 August 1960 until his death on 3 August 1977, was a central figure in the history of Cyprus. He was born Michael Mouskos in August 1913 to a peasant family in the Greek-Cypriot village of Pano Panagia on the high western slopes of Mount Troodos.

It had been a strength of the Church under Ottoman rule that its hierarchy was largely drawn from the ablest sons of the poor. It was to prove one of Makarios's strengths, first as elected archbishop and ethnarch and then as president, that he combined the traditional legitimacy stemming from an autocephaly that dated to the 5th century and from eight centuries' experience of a subject community gathered around its archbishop, with the modern democratic legitimacy of popular election. His sense of empathy with his community was unparalleled: it is doubtful whether he ever misinterpreted the majority will on any important issue. This ability to read and express his community's mind (to a degree unmatched by professional politicians like Constantine Karamanlis and the Papandreous) was simultaneously his greatest disadvantage in governing an island containing another community, namely the Turkish-Cypriot.

He entered Kykko Monastery in 1926 as a novice aged 13. In 1933 he was sent to the Pan-Cyprian Gymnasium in Nicosia. He returned to Kykko as a teacher in 1936. After being ordained Deacon Makarios at the age of 25, he studied theology at Athens University from 1938 to 1942, experiencing war, occupation, and the civil strife of 1944, when he entered law school. Ordained priest in 1946, he served in a working-class parish of Piraeus until a World Council of Churches scholarship enabled him to continue theological studies in Boston between 1946 and 1948, when he received the unsought honour of election as bishop of Kitium (Larnaca and Limassol).

The postwar campaign for union with Greece (*enosis*), which expressed both the genuine aspirations of Greek Cypriots and the hierarchy's determination to recover the initiative from the communist AKEL (*Anorthotikon Komma Ergazomenou Laou*, the Progressive Party of the Working People) while civil war raged in Greece, had already begun. In

December 1949 the ethnarchy announced that if the British governor did not hold a plebiscite the Church would. Makarios organized this in January 1950. Of those eligible (all Greek Cypriots over the age of 18) 95.7 per cent signed their names for *enosis*. In June 1950 archbishop Makarios II died, and in October Makarios III, aged 37, was elected archbishop and ethnarch by indirect popular vote.

Makarios's political life can be divided into four periods: the unsuccessful struggle for self-determination and *enosis* in the 1950s; his term as president of a united but diarchic republic from 1960 to the end of 1963; his attempts as president to achieve a new constitution while increasingly beleaguered by enemies outside and within; and his overthrow and restoration as president after the Greek junta's coup and the Turkish invasions of 1974.

The first period, when Makarios was politically inexperienced, partly determined the other three. Ecclesiastical and national tradition dictated Makarios's original aim: the union of a united island with Greece. Since, until autumn 1955, London rejected both self-determination and independence, Makarios pressed the Greek government to take Cyprus's cause to the UN. Eden's harsh private treatment of Alexandros Papagos and the public "never" in the House of Commons achieved this in 1954, but Greek recourse to the UN over five years proved fruitless, partly because anti-colonialist countries supported struggles for independence, not irredentism.

More immediately successful, but disastrous in the long term, was the decision to extend the liberation struggle for *enosis* by the use of violent means through the EOKA campaign, intended by Makarios to be limited to sabotage, under George Grivas. EOKA (*Ethniki Organosi Kyprion Agoniston*, the National Organization of Cypriot Fighters) began operations in April 1955, making the British position most uncomfortable, but the tradition thus created of the national legitimacy of secret and violent conspiracy was ultimately to lead Cyprus and Makarios to disaster. Worse, London now ensured that Ankara brought itself into the equation, demanding partition. The Greek community of Istanbul paid a heavy price in September 1955; Greek Cypriots have been paying ever since.

One chance to escape from the impending impasse may have been the constitutional negotiations – nearly successful – of 1955/56 with the then governor, Sir John Harding. Failure was followed by Makarios's exile to the Seychelles from March 1956 until March 1957, when he went to Athens. The situation in Cyprus deteriorated quickly during his exile. Intercommunal violence broke out in June 1958 with Greek-Cypriots the initial victims, and separate Turkish-Cypriot municipalities were set up.

In June 1958 the Macmillan plan offered seven years of self-government followed by shared sovereignty between Britain, Greece, and Turkey. Makarios reacted in September by proposing the alternative of independence. In December the Turkish and Greek foreign ministers, Fatin Zorlu and Evangelos Averof, started the contacts which led to the Zurich–London agreements guaranteed by Britain, Greece, and Turkey.

From the Greek-Cypriot point of view the agreements were necessary to avoid partition; but they involved commitments to abandon the century-old aspiration for *enosis* and to implement a complex diarchic constitution entrenching extensive

Archbishop Makarios III, president of Cyprus 1960–77

Turkish-Cypriot veto powers. Greek-Cypriot opinion accepted independence but was unhappy with one or both of the restrictions. Even before independence pro-*enosis* statements on the one side and the importation of arms on the other (the "Deniz" incident in which a Turkish ship was intercepted by the British) had begun to create a vicious circle of mistrust.

Elected president in December 1959 with two-thirds of the votes against the more rigid Enotists and AKEL, Makarios demonstrated his qualities of leadership. He did not suppress AKEL, as Karamanlis and Adnan Menderes had planned, but brought it into the political system. He showed his capacity for administration and economic management to the benefit of state, Church, and people alike. He cut an impressive figure on the world stage, joining the Third World countries but sometimes differentiating his position, as when he became one of the first declared supporters of a united Germany.

No one will ever determine whether Makarios's public pro-*enosis* statements represented actual policy, sincere lip-service to an impracticable but still popular ideal, or a necessary concession to his most dangerous opponents. The second possibility would have permitted him to use his statements for the first and third as events demanded, and is therefore the most likely hypothesis.

It seems he finally decided to propose constitutional change after the Turkish-Cypriot representatives refused to pass an income-tax bill in December 1961. The constitutional proposals of November 1963 were the ultimate consequence.

Considered an acceptable opening position by the then British High Commissioner in Nicosia, they were rejected out of hand first by Ankara and then by the Turkish Cypriots.

Earlier there had also been tensions over the composition of the public service and separate municipalities. The Turkish-Cypriot vice-president's veto of an integrated army in a 60/40 ratio resulted in the creation of official/unofficial armies on both sides with contingency plans or instructions to their armed groups. In December 1963 tension between them exploded into widespread violence.

The official Turkish-Cypriot response was withdrawal from state institutions and self-enclosure in enclaves, thus giving Makarios de facto majority control of the government, but at the cost of territorial division and serious bloodletting in many parts of the island. Although about half of the Turkish-Cypriot population continued to live peaceably in areas under Greek-Cypriot control, the destruction of Turkish-Cypriot neighbourhoods, the intercommunal strife, and Ankara's threats of intervention led the Security Council to create UNFICYP (United Nations Force in Cyprus) in March 1964 to keep the peace wherever possible. Makarios could be satisfied that the relevant resolution recognized the Cyprus government's legitimacy, but there was lasting damage to the Greek Cypriots' international image as a result of incidents in which Greek-Cypriot irregulars attacked Turkish-Cypriot individuals and villages.

From 1964 to 1967, with Grivas in command of a large Greek force illegally infiltrated, pressure on the Turkish-Cypriot community was maintained in a variety of ways. Consistent with his fundamental adherence to the unity of Cyprus, Makarios in 1964 rejected the American "Acheson plan" as essentially partitionist.

The Greek junta's coup in 1967 and the autumn attack on Hagios Theodoros precipitated a major crisis resulting in the withdrawal of Grivas and the Greek army, a declared shift of policy by Makarios to the feasible strategy of majority-rule independence (as opposed to the desirable dream of *enosis*), and the abolition of barriers to free movement for Turkish Cypriots. During 1968 serious intercommunal talks began and Makarios was reelected president against an Enotist with 95 per cent of the vote.

Perhaps Makarios's greatest single error was in not pressing for an agreement with the Turkish Cypriots in 1968 when they seemed to accept local autonomy and majority rule. From 1969 the security situation swung against him as the junta organized pro-Enotist clandestine opposition to his policy. In 1970 he escaped assassination by a miracle. In 1971 Grivas returned illegally to the island. In 1972 the three other bishops tried to defrock him and the junta's supporters almost mounted a coup, which was foiled by a temporary alliance between Makarios and Grivas (an Enotist but not a junta supporter). In 1973 Makarios was re-elected president unopposed, but violence continued and there was another assassination attempt. In January 1974 Grivas died and his clandestine movement was taken over by the junta.

Despite Makarios's able manoeuvring, the hatred of the Athens junta increasingly hemmed him in. Officially Athens favoured the intercommunal talks: behind the scenes it supported *enosis*, even if this implied territorial concessions to Ankara. Threatened again by a coup, Makarios counterattacked with his letter of 2 July to the Greek president demanding the withdrawal of officers plotting against him. His optimism that he had thus overcome the danger was misplaced: on 15 July the Greek-officered National Guard overthrew the legitimate government. Again almost miraculously, he escaped first to Paphos and then abroad.

Greek involvement gave Turkey an opportunity to intervene. While London washed its hands, Ankara carried out two military interventions, in July and August, that led to loss of life on Cyprus unparalleled since 1571. This open attempt to impose partition through the expulsion of Greek Cypriots from the occupied areas, and to ensure that any settlement would rest not on democratic principle but on Ankara's absolute control of part of Cyprus and veto rights over the remainder, was effectively opposed during Makarios's lifetime only by the US Congress.

Makarios was never more admirable than with his life's work in ruins. He rallied his community to the need for a long struggle rather than surrender, correctly judged that economic recovery was a priority and quickly set it in train, and before he died made the crucial concession to the Turkish Cypriots of accepting a federal solution (still within the boundaries of acceptable democratic theory) which was agreed by both communities in February 1977 and has been confirmed by numerous Security Council Resolutions since.

It is easy to judge Makarios as a leader who failed either to achieve *enosis* or to preserve a united island, his two original aims. Weaker in strategic vision than Karamanlis, and less successful tactically than Andreas Papandreou, he proved better at administration and economic management than either. Effectively he created a state he originally had had no intention of creating. His legacy, a democratic, prosperous, and consensual society, may ultimately prove attractive to all its citizens, and not only the Greek-Cypriot community which he so faithfully represented and served.

It is also easy to judge Makarios as a churchman, committed indeed to charitable and missionary work in Africa, but irremediably compromised by involvement in politics, resort to violence, and repeated disingenuousness. This is a common western view, which displays a lack of human understanding. Cypriot archbishops had been required to represent their people in a potentially self-sacrificial manner since 1571: the pursuit of any subjected people's best interests is likely to involve the exercise of guile. The lessons of centuries of subservience were not to be unlearnt in a few years even had the situation been ideal, and it was never that.

It was in human qualities that Makarios shone. A close collaborator, Stella Soulioti, has said: "He remained to the end a shepherd boy – a shepherd with the manners of a king." Beneath the surface of a shrewd diplomat lay an almost child-like innocence, unassuming, gentle, and self-critical. A deep calm underpinned the courage displayed in the lack of precautions taken for his personal safety when his life was in constant danger. He was immediately available to ordinary Greek Cypriots: his humour and consideration for others were notable, while his simplicity and directness in human contact were the opposite of that fundamental deviousness so confidently ascribed to him in the western press.

His integrity may be seen in his having personally lodged Turkish-Cypriot hospital staff at the Archbishopric for a night in December 1963 before sending them to the safety of their

own community; and by the experience of an unexpected caller who, when told he was officiating in the cathedral, entered to find the Archbishop conducting the funeral of a beggar, for whom he was the only mourner.

Makarios therefore was a living example of the differing qualities admired by those in the Anglo-Saxon and Hellenic traditions. An admiration for humour, courage, and dignity combined with simplicity is shared. The traditions then part, one putting overriding emphasis on adherence to ethical norms and the overall consequences of actions; the other on existential commitment and humanity. In his commitment to and his sense of communion with his people, Makarios expressed a quintessentially Orthodox Christian view of the scale of priorities in human life.

Biography

Born Michael Mouskos in 1913 to a peasant family in the Greek-Cypriot village of Pano Panagia, he entered Kykko monastery as a novice in 1926. After three years at the Gymnasium in Nicosia, he returned to Kykko as a teacher in 1936 and was ordained a deacon in 1938. He studied theology at Athens University in 1938–42 and was ordained a priest in 1946. He studied in Boston in 1946–48 and was then elected bishop of Kitium. In 1950 he was elected archbishop and ethnarch and in 1959 president of an independent Cyprus, which he remained until his death in 1977.

Makriyannis, Yannis 1797–1864

A leading figure of the Greek War of Independence and Othonian Greece

Yannis (Ioannis) Makriyannis was a distinguished figure in Greece's political history in the 19th century. He was born in 1797 and, after spending several years working, he joined the *Philiki Hetaireia* and participated in the War of Independence. He took part in various memorable battles and was repeatedly injured, a fact that was to affect decisively his life afterwards. He also held several strategic posts (e.g. as military head of Athens in 1825), tried to bring order among Greek irregulars, and associated himself with well-known war personalities. After the end of the war Makriyannis, being liberal by nature, disagreed with Ioannis Kapodistria's policies and lost his position as head of the Executive Committee. Although he believed that king Otho's arrival would ameliorate Greece's situation, Makriyannis was disappointed by later developments including the unfair treatment of veterans by the government and he had conflicts with the regency member count Armansperg. After that Makriyannis avoided any involvement in public affairs until 1840. Between 1836 and 1839 he occupied himself with the creation – together with the painter Panayotis Zographos – of aquarelles (five series of 25 uniform paintings) devoted to the War of Independence and based on his own battle experiences and memories. One series of aquarelles survives today at the Gennadion Library in Athens and another at Windsor Castle.

Yet, Makriyannis's sense of justice, integrity, and patriotism could not keep him away from politics. He realized the need for a constitutional charter and after 1840 he worked in clandestine meetings for such a plan. This materialized on 3 September 1843 through the intervention of the army under Dimitrios Kallergis and the participation of the people, fortunately without bloodshed. In 1844 Makriyannis was elected representative of Athens in the National Assembly where he distinguished himself for his resolutions concerning the Church, the Greek citizens, and the rights of the veterans. He was also appointed major-general. In 1852 Makriyannis was accused of a conspiracy against Otho's life, imprisoned, brought to trial, and sentenced to death. But his conviction caused heated reactions from the public and the press, which forced the conversion of his death penalty initially into life and later into a ten-year sentence. On 2 September 1854, however, Makriyannis was set free, but his health had seriously deteriorated due to previous injuries. In the anti-Othonian movement of 10 October 1862 the Greek public remembered Makriyannis's contributions and honoured him as a folk and national hero. He was reinstated in his previous office, but his already poor health weakened further, and he died on 27 April 1864.

Although Makriyannis had received no education at all and barely knew how to write, he still left two works behind that were published posthumously and were considered seminal contributions to modern Greek culture. The first is his *Memoirs*, which Makriyannis started writing in February 1829 and completed in 1850. They constitute a first-hand description of the War of Independence and Othonian Greece. This work was discovered, transcribed, and published for the first time in 1907 by Yannis Vlachoyannis. Makriyannis's second prose work, entitled *Visions and Miracles*, was written in 1851–52, left unfinished, and published for the first time in 1983. Both works are important for their historical content, for their use of the demotic language, as it was spoken in Greece then, and for their literary merit. Thus, it is no wonder that Makriyannis's personality attracted the attention, the

Yannis Makriyannis: statue of general Makriyannis at the old entrance to Athens, below the Acropolis

positive appreciation, and the admiration of numerous renowned Greek thinkers (e.g. George Seferis, Yorgos Theotokas, Odysseus Elytis, Zisimos Lorentzatos).

The importance of Makriyannis's thought lies in his holistic view of Greek history. He professed the fundamental unity between Hellenism and Orthodoxy, and he considered the latter as the decisive factor for the preservation of the former. He was convinced that God was behind the just war of the Greeks against the Ottomans and had granted them their liberation against all adversities (e.g. in the period of anarchy, 1831–33). His fervent patriotism was religiously legitimized. Makriyannis had a simple but deep faith in God and never vacillated between the Scylla of rationalism and the Charybdis of unbelief. The fear of God for him was a prerequisite for maintaining order, piety, and ethics in human societies.

Makriyannis's social criticism was mainly directed against Greece's multiple dependence on the West and its impact upon the Orthodox popular ethos. Greece's religious estrangement signified political and social subordination too. He was alarmed by the policies of the Bavarian regime, such as the closing of numerous monasteries and the confiscation of their property, and by the increased proselytism of foreign missionaries. Makriyannis was very critical of the "Westernized" Greeks (e.g. Theophilos Kairis), who, he believed, were transformed into slaves of Western interests. Despite his defence of Orthodoxy against Western designs, Makriyannis simultaneously supported religious tolerance. Human freedom was for him inviolable and any form of proselytism unacceptable. The view of human destiny as a dynamic struggle between life and death was instrumental in forging his self-understanding and in motivating his activities. Makriyannis was thus influenced by the fundamental Orthodox orientation that regards this transient earthly life as a preamble for the eternal life to come.

Later interpretations and assessments of Makriyannis's thought and legacy vary considerably. For some, the illiterate Makriyannis is the most authentic embodiment of the uncontaminated Orthodox ethos, whose presuppositions and criteria are quite different from those of the West. His simple and apparently naive, but also realistic and effective solutions to various problems are considered useful from a contemporary perspective too. Makriyannis is seen as expressing the authentic voice of the Greek people. Others, however, emphasize the traumatic experiences in Makriyannis's life and the serious effects they might have had not only on his physical but also on his mental health. They argue that Makriyannis might have suffered from illusions, aberrations, and epileptic crises combined with superstitions and a morbid religiosity. In other words, he was some kind of a "madman". The objectivity of his judgements is also questioned, because Makriyannis seems to have been an obstinate, quarrelsome, intransigent, and embittered person. As a result, without discarding his views entirely, some scholars suggest that they should be treated carefully and with reservations. The same applies to the historical information contained in his works.

Despite these differences in evaluating Makriyannis, it is undeniable that his works include much useful material relating to Greek culture, its past, and its relationship to the West. As such, they constitute weighty documents of modern Greek history. Makriyannis pointed out with honesty, clarity, and simplicity the sources of Greece's many problems and offered

several viable solutions. He did not present an idealistic version of Greece's situation, but was very sincere, had a sense of self-respect, showed no self-interest in his dealings, and viewed himself as on a mission to safeguard his country. He outspokenly castigated his compatriots for their multiple transgressions and deficiencies. Therefore, it is understandable why his ideas and proposals have been so much discussed and why they will certainly become the focus of varying approaches and interpretations in the future too.

Mallia

Town in Crete

The archaeological site and modern town of Mallia is located on the island of Crete, less than 40 km east of Herakleion. It lies within a narrow plain on the northern coast that is bounded to the south by the Dikte mountain range dominated by Mount Selena (1559 m), the site of the Bronze Age peak sanctuary, which rises steeply behind the little church of Prophitis Ilias. From ancient times to the present day the area surrounding Mallia, including the plain, the mountains, and the valleys leading to them, has been characterized by its rich agriculture. Today, the produce includes potatoes, olives, and other fruits, as well as cereals. The herding of sheep and goats as well as traditional cheese making continues to be practised in the mountains to the south. Fishing is also an important activity along the coastal plain and there is evidence of two ancient harbours in the vicinity that would have served both fishing and sea trade in Minoan times.

Mallia is famous today as the site of the third greatest Minoan palace after those at Knossos and Phaestus. The presence of antiquities at the site was first discovered in the late 19th century after a shepherd found some gold leaf by the sea and the local inhabitants began digging for Minoan treasure. In 1915 Joseph Hazzidakis, then ephor of Cretan antiquities, began a more formal exploration of the site. Since 1922, however, systematic excavations have been undertaken by a team from the École Archéologique Française d'Athènes, led by Fernand Chapouthier, Jean Charbonneaux, and others. By 1932 the excavation of the palace was completed. The French archaeologists continue their excavations in the Minoan town and ancient cemeteries by the sea, publishing the results of their investigations in the series *Études Crétoises*.

While the palace at Mallia lacks the mythological fame of Knossos and is less sumptuously decorated and smaller in size (nearly 8900 sq m or about the size of the palace of Phaestus), it is beautifully sited with a view of the sea. It is also remarkable for having its ground plan preserved virtually intact and, unlike Knossos, it remains unreconstructed. Concrete and iron supports as well as protective roofs have been used only where necessary to preserve the Minoan buildings, providing visitors with a unique opportunity to experience the ancient architecture without controversial modern interventions.

The earliest traces of habitation at the site of Mallia are prepalatial, dating to the Early Minoan III–Middle Minoan IA period (*c.*2300–1900 BC). The first phase of the palace, known as the Old Palace, dates from the Middle Minoan IB–II period (1900–1700 BC) and is contemporary with the Old Palaces at Knossos and Phaestus – all of which were destroyed by a large earthquake at the end of the Middle Minoan II period. The Old Palace at Mallia is known mainly from some large plastered rooms in the northwestern corner that were richly appointed. It was from these rooms that the famous sword with the pommel covered by gold and decorated with an arched acrobat in low relief, now in the Herakleion Museum, was found. Also dating from the time of the Old Palace is the unique double row of four circular structures, each built around a central pillar that probably supported a roof, which is located in the southwestern corner of the palace. These structures were most likely used as silos or granaries.

Most of what is visible today, however, belongs to the New Palace, which dates from the Middle Minoan III–Late Minoan IB period (*c.*1700–1425 BC). Except for the fact that there is no monumental theatral area, this structure has all the characteristics of a typical Minoan palace, including a central court with an unusual open pit for burnt offerings, storage magazines with large pithoi and channels to collect drippings of oil, and a number of ritual chambers including a pillar crypt in the west wing. In one of these chambers, on a floor dating to the Old Palace, were found the ceremonial leopard's-head axe and the large sword with a gilded blade and pommel of crystal and amethyst, both outstanding examples of Minoan craftsmanship now on display in the Herakleion Museum. Some of the more unusual features of the palace include the pillared hall to the north, probably used for banquets, and the great circular *kernos* (offering-stand) stone, located in the southwestern corner of the central court, which has a large hollow at the centre and 34 smaller ones around the circumference that may have been used for the offering of first fruits to a deity. The New Palace was destroyed in the Late Minoan IB period and subsequent pillaging left few objects of value from this phase for modern excavators. One exception is a remarkable triton shell, carved from chlorite with relief decoration, that was found in the northeastern corner of the palace and now resides in the Archaeological Museum in Agios Nikolaos.

To the north of the palace, French excavators have also brought to light a large open area with a plaster floor, called the Agora, as well as a series of plastered basement rooms with benches, known as the Hypostyle Crypt. The lack of significant finds from these unique structures, which belong to the period of the Old Palace, has led to the suggestion that they served as a kind of council chamber. The Minoan town surrounding these structures and the palace itself is composed of quarters (*quartiers*) belonging to different periods of use. Most of the houses within these quarters are modest but include a number of well-preserved examples of Minoan domestic architecture. An exception, however, is Quartier Mu, whose special significance is indicated by rich finds and buildings from the period of the Old Palace that include a heiroglyphic archive, a small sanctuary with its furnishing still in situ, and the oldest roofed lustral basin in Crete.

The cemeteries of ancient Mallia are located to the north of the settlement along the seashore. They include a number of early ossuaries as well as some tombs of the Late Minoan III period (*c.*1390–1070 BC). Most significant, however, is the cemetery of Chrysolakkos (pit of gold), a large rectangular burial enclosure dating to the Middle Minoan IB–II period (1900–1700 BC). The facade of this building is constructed of partly dressed limestone blocks which are among the earliest examples of ashlar masonry on Crete. Although the Chrysolakkos cemetery was plundered by local tomb robbers in the 1880s, it is famous as the source of the well-known gold pendant of two conjoined bees or wasps with a honeycomb (dated *c.*1700 BC), now in the Herakleion Museum, that was found by Pierre Demargne in 1945. Based on comparisons with this piece, Reynold Higgins once suggested that the hoard of Minoan gold jewellery known as the Aegina Treasure, acquired by the British Museum in 1892, also came from the Chrysolakkos. New finds from Aegina, however, make this theory unlikely. On the beach to the west of the Chrysolakkos, there is also evidence for a sizeable Roman settlement including houses and tombs as well as an early Byzantine basilica.

The modern town of Mallia, about 2 km to the west of the archaeological site, is split by the highway that is always congested due to the large number of tourist shops, hotels, tavernas, bars, and nightclubs that line it and continue down to the sea. There is a long sandy beach here that today attracts crowds of tourists who rarely visit the archaeological site or cross the highway into the older part of the town with its charming narrow streets and whitewashed walls.

ANN M. NICGORSKI

Summary

Mallia is the site of the third-greatest Minoan palace on Crete after those of Knossos and Phaestus. Formal exploration of the site began in 1915. The earliest traces are prepalatial. The Old Palace remains date from 1900 to 1700 BC. Most of what is visible today belongs to the New Palace which dates from *c.*1700 to 1425 BC. The cemeteries have yielded significant finds.

Mani

Region in the southern Peloponnese

For the past 1100 years the names Maïni, Braccio di Maina, Vrachion tis Manis, and Mani have demarcated the land which occupies the middle of the three peninsulas in the southern Peloponnese. The peninsula, 75 km in length and 10–20 km in width, consists of the Taygetus massif, the Mediterranean end of the Alpine branch of the Pindus chain. Its southernmost point is the promontory of Tainaro or Cape Matapan, at the same latitude (36 degrees) as southern Italy and the straits of Gibraltar. The ancient name of the Mani was Lakoniki (Laconia).

During centuries of historical upheaval the geography of this isolated and mountainous area, deprived of important natural resources, made it a safe refuge and hideout, the home of a large population with a unique way of life with primitive features. Thus it came to stand out as a separate geographical, historical, and cultural entity.

The Taygetos mountain range divides the Mani into the "sunny" (east) and "shady" (west) parts. The region is also divided traditionally into several large sections with distinctive characteristics. The northwestern section or Outer Mani has a rich landscape and consists of the lower slopes and highest summits of Taygetus (Profitis Ilias, at 2407 m, is the highest peak in the Peloponnese). The northeastern section or Lower Mani has a varied landscape and fine bays, including both the main port of Gytheion and the rocky gorge with the Passava fortress. The southern part or Inner Mani is occupied by the limestone crystalline range of Kato Taygetos, with an arid rocky coastal plateau to the west. It slides down to the Mediterranean at the tiny promontory of Tainaro, which in antiquity was considered to be the gate into Hades.

Archaeological finds (from several coastal caves) indicate that the area was inhabited in the Palaeolithic era, in the Neolithic period (4500–2800 BC, Diros caves, etc.), in the Helladic period (2800–2000 BC, a number of settlements on low hills and plains), and the Middle and Late Helladic periods, when the Achaeans held power. Homer's *Iliad* 1 refers to eight towns in the Mani at the time of the Trojan War. At the same time Cape Tainaron was already an important place of worship dedicated to Helios-Apollo.

The Dorians invaded Lakonike in the 12th century BC, originally settling in Sparta and expanding gradually along the coast. They hemmed in the local populations, incorporating them as *perioikoi* ("dwellers around") into the military and political system of the Spartan city state. It appears that the *komes*, that is, the small towns and agricultural communities of the peninsula, retained some autonomy and numerous religious practices. Gytheion became the main Spartan port, while at Cape Tainaron, dedicated to the chthonic god Poseidon, there was a sanctuary with a sacred precinct for the conducting of the dead and an oracle of the dead.

When Sparta's power declined, the coastal towns of Lakonike increased their autonomy and from the beginning of the 2nd century BC, with the support of the Romans, formed the League of the Lacedaemonians, with ten towns in the Mani itself. During the Roman period this federation was renamed the League of the Free Laconians and prospered thanks to trade (in marble, porphyry, etc.). Violent earthquakes (AD 375) and Gothic raids (AD 395) signalled the end of the ancient period.

In the centuries that followed, many of the coastal sites became insecure. The population withdrew into the hinterland, as evidenced by the ruins of "megalithic" settlements of various sizes. The houses of these settlements, with their masonry of large stones and the massive stone beams which served to cover their spaces, were, with the war towers and cisterns, the starting point from which the Maniot buildings and settlements of more modern times slowly evolved. However, some of the coastal centres were still active in the 6th and 7th centuries. In the Dark Ages of the 7th and 8th centuries, the Mani suffered pirate raids and the Slav incursions. Starting in the 9th century, some Slavic tribes settled on Ano Taygetos. At this time the peninsula first appears under the name Maïni or Mani. It became a part of the theme of the Peloponnese and was caught up in the process of reorganization of the Byzantine provinces. In the Middle Byzantine period (late 9th–12th centuries) the Christianization of the Slavic and Maniot communities was actively promoted and was accompanied by the construction of a series of elaborate churches with distinctive architecture, sculpture, and painting which is thought to have influenced the later churches of Mistra.

After the Frankish period (1204–1432 in the Peloponnese, 1249–1261 in the Mani), the peninsula became a dependency of the despotate of Mistra and in 1415 the Palaiologan army pulled down the medieval fortifications there in order to weaken local centres of resistance. The scholars of Mistra and other centres described in dark colours the insubordinate, savage, and warlike Maniots, while medieval sources mention the primitive indigenous customs and the megalithic buildings. The castles of Maïna (Tigani), Passava, and Gisternes (Beaufort) date from the medieval period.

After the subjugation of the mainland by the Turks, the Mani put up stiff resistance and to them and was incorporated into a special privileged system which included internal autonomy, permission for the inhabitants to bear arms, and the obligation to pay an annual tribute. Under these conditions, the population of the Mani increased significantly. The self-ruling patriarchal system, organized in armed consanguineous groups (clans, lineages, etc.) with patrilocal installations, was retained as a basic way of life. Agricultural activities, commerce, and piracy were based on the power of weapons and the land was strengthened with effective fortifications against invaders from land or sea.

After the Turkish–Venetian war in Crete (1645–65), the Turks achieved greater control of the Mani, appointing as governor ("Giaour pasha") the local pirate Limberakis Gerakaris and constructing castles at Zarnata, Port-Kayio, and Kelefa. During the final decades of the 17th century, the dire conditions arising from the Turkish oppression and the deadly Maniot civil wars led many inhabitants to move to the Ionian islands and to Spanish and Genoese possessions (Taranto, Tuscany, Corsica). Under Venetian rule (1685–1715), Venetian administrators and garrisons were installed in the forts of the Mani, to which the area of Vardounia was also added. The Venetians officially recognized the chiefs of the various small districts, who were given the title of *kapetanioi* (captains). The *kapetanies* established in the north of the peninsula made progress, but in the south the new system did not take root. In 1715 the Turks prevailed over the Venetians again and imposed a yearly tribute; their control was loose, but they instigated local civil strife. After 1740 the northern Mani enjoyed a relative degree of socioeconomic development, while in the south increasing demographic pressure led to intensified disturbances, piracy, feuds, and the destruction of entire villages.

After the Russian-inspired Orloff rising of 1770 the Turks endeavoured to increase their influence, proclaiming the Mani a *Bas Beiliki* and appointing a powerful local *kapetanios* as "Maniatbey", with responsibility for the actions of the Maniots and for the collection of the annual tribute. There were eight Maniatbeys during the last 45 years of Ottoman rule.

On the eve of 1821 the intervention of the *Philiki Hetaireia* brought the hostilities among the leading families to a halt and the Mani became the "military centre of the Morea". The population reached 35,000 at this time. During the War of Independence, the Maniots fought courageously and decisively both inside and outside the Morea.

The unusual man-made environment of the Mani reflects faithfully the varied local social system, which was based on blood kinship. In the northern parts the clans were hierarchically ordered and stratified; endogamy was practised, and there were hereditary chieftains. The chieftains owned considerable tracts of land and had fortified strongholds which stood out in the villages themselves, at crucial points along the coast, and in the hinterland. The tower houses of the powerful families had between three and five storeys and were used both as residences and as refuges or fortresses. In the more official buildings (towers, churches, bell towers, fountains), features betraying Western or Ottoman influence can be identified, while the beys possessed remarkable walled enclosures – some simple, some more complex.

In the south the clans were internally equal, strictly exogamous, and their classification was based primarily on the number of their members (*douphekia*, rifles). The chieftains were elected and their authority could be revoked. Control over vital areas was exercised collectively by decision of the council of elderly men (the *yerondiki*). The war tower, the cannon, the cemetery, and the church were unconditionally the collective property of the clan or the specific lineage. The powerful clans (*megaloyennites*, the well-born) recognized one another, and kept under their protection and control the weaker clans (the *achamnomeri*, the thin ones) and the lowest inhabitants of all (the *phameyi*, or dependants).

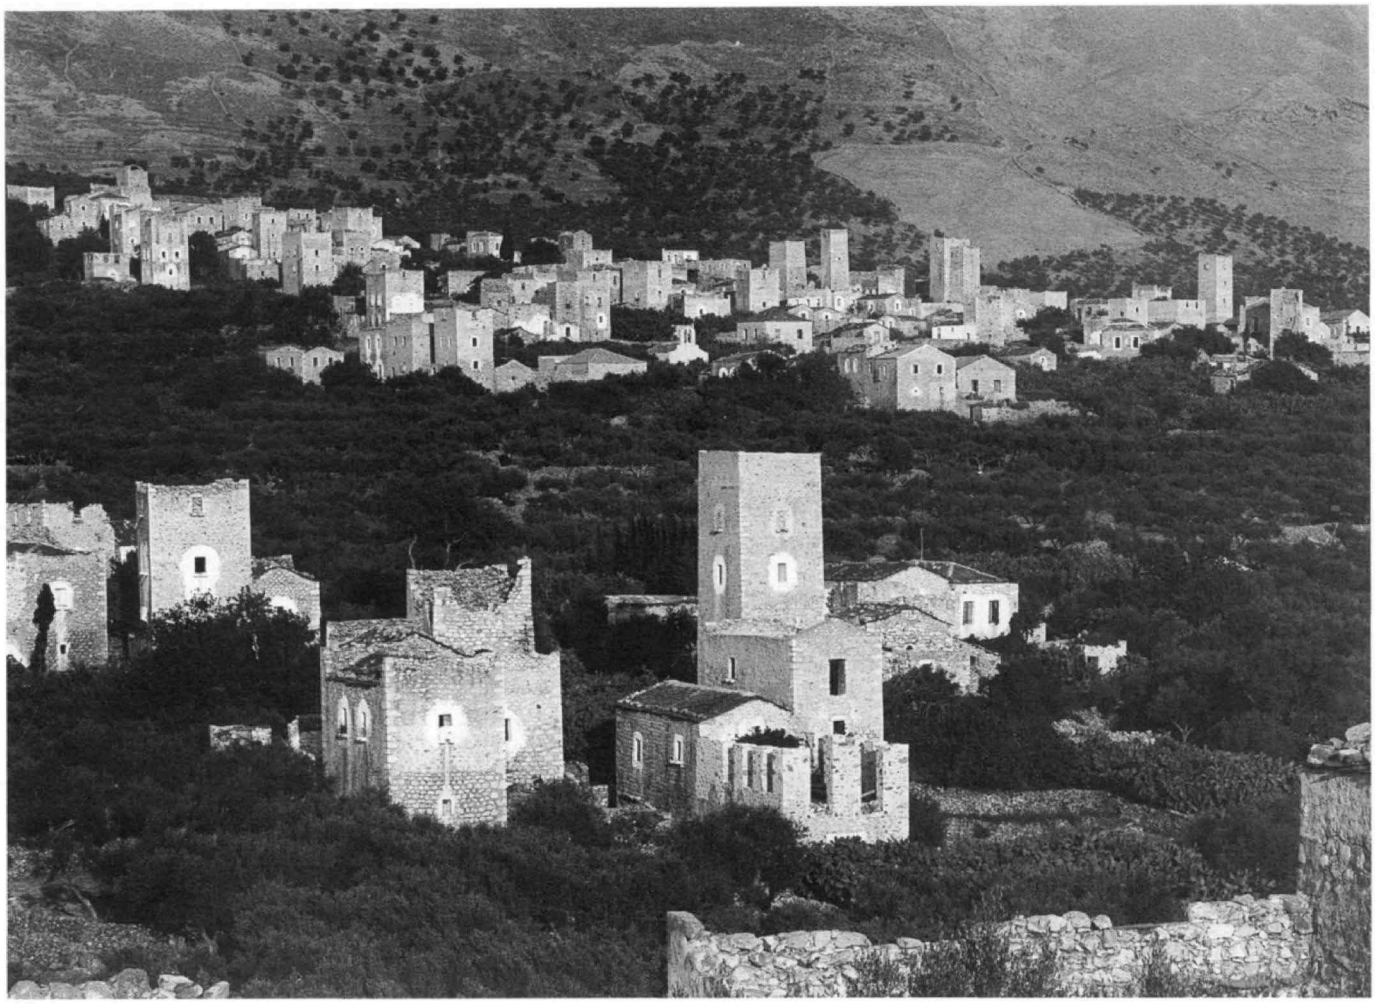
The clans were localized in villages which were generally small and arranged in wards or neighbourhoods of one or more lineages. The houses of the families huddled in a carefully arranged pattern around the collective war tower. These houses were oblong rectangular nuclei, usually with two storeys, with people on the upper level and animals on the lower. This fixed prototype was augmented by outbuildings in the courtyards and combined with other familial nuclei so as to shape the composite defensive installation of the patrilineal group. The *achamnomeri* lived in separate neighbourhoods, and if they managed to gain strength (by amalgamation or by an increase in the number of their members) they could acquire towers of their own. Until the mid-18th century technical limitations made it difficult to build tall towers, but after the 19th century the introduction of mortar and dressed masonry enabled the construction of war towers and tower houses 18–20 m in height with between four and seven storeys.

In addition to wars against external foes and the threat of piracy, the distinctive and endemic features of the Maniot system were the internal hostilities (*echthres*, feuds), armed conflicts (*polemoi*, wars), and killings of vengeance (*dikiomoi*), which were the permanent expression of the contradictions inside Maniot society. The dialogue with "Charon" was expressed also in the tragic dirges called *moirologia* typical of the Mani and in the cult of dead ancestors and family members. Many of the traditions and legends of the Mani dwell on relationships between mortals and the chthonic powers and souls in the depths of the Underworld.

The Maniots, who had actively contributed to the struggle for independence, were incorporated into the new Greek state with great difficulty. The period down to 1836 was characterized by conflicts, revolutionary movements, the assassination of Count Ioannis Kapodistria by the Mavromichalis clan, and clashes with the Bavarian regency. Turmoil and civil strife continued down to 1870, especially in the south. Later, with the gradual establishment of state justice, of the money economy, and of education, the closed local system, with its numerous medieval characteristics, had to adapt in many significant respects. The emigration of a significant proportion of the work force and the reduction of local autonomy transformed the traditional social hierarchy. By the late 19th century the population had reached its zenith, 50,000, distributed among 200–250 settlements.

New settlements were established along lines of communication and in some coastal situations. The port of Gytheion flourished once more. In the villages the houses began to spread away from the traditional focuses of the clans, and houses were also built in the fields. The appearance of many villages changed with the construction of workshops, olive presses, shops, cafés, communally owned churches in the larger settlements, and many new tower houses.

Between the early 20th century and 1940 the economy, based on the cultivation of the olive tree, reached its highest level of productivity. But urbanization and the upheavals of World War II and the Greek Civil War (1940–49) caused the population to shrink and drastically limited local activities. The construction of the main motor road made the exodus easier and contributed to the decline of the ports. Many of the



Mani: the village of Kita "of the many towers" in southern Mani, *c.*1930. Many of the towers are now in ruins.

smaller villages were completely deserted and the local phrase "a house with a kitchen and a husband in Athens" shows the mentality of the times. In 1990 the population was approximately 25,000.

In recent decades some utilities and infrastructure networks have been installed. The requirements of new constructions, holiday housing, and tourist accommodation have often created problems of despoliation of the environment. Regional planning and development studies have emphasized the need to protect and develop a unique historical and cultural heritage, recognizing it as a basic local resource of national importance.

Certain public-sector programmes and projects have functioned in this direction since 1974: numerous buildings and sites were classed as monuments, and 78 per cent of the Maniot villages have been declared traditional settlements. In 1978, 71 villages – 31 per cent of the total – were scheduled for protection (as against a scheduling level of 0.6 per cent in the Peloponnese as a whole). Special building regulations have been introduced for the villages and the landscape of the southern Mani. The caves of Diros and a small museum with Neolithic finds have been opened to the public, restoration work has been done on many Byzantine and post-Byzantine churches, a number of guest houses have been established in traditional tower houses, and some important historical buildings have been converted into museums. Urban design projects for some villages and projects to document the history, society, and habitat of the peninsula are also under way.

Summary

The region of Mani occupies the middle of the three peninsulas of the southern Peloponnese. Throughout history its geographical isolation has made it a safe refuge. It was invaded by Dorians in the 12th century BC and the population was incorporated in the Spartan city state. Autonomy increased under the Romans but Slavs invaded in the 7th and 8th centuries. From 1261 until the arrival of the Ottomans it was a dependency of the despotate of Mistra. Special privileges granted by the Turks brought increased autonomy. Maniots played a full part in the War of Independence. More recently it has suffered from depopulation. The unusual man-made environment of the Mani represents a historical and cultural heritage of national importance.

Manuel I Komnenos 1118–1180

Emperor

Manuel I (1143–80), the fourth and youngest son of John II Komnenos and his Hungarian wife Piroska-Irene, was born on 28 November 1118. He succeeded to the throne in 1143, aged 25, despite having one surviving elder brother, Isaac. He died on 24 September 1180. The latest research, by Paul Magdalino, has demonstrated that Manuel's reign is best treated in two parts: 1143–60 and 1160–80.

In his early years Manuel did little more than continue his father's policies, and seek to consolidate his tenuous hold on power. He chose to make political capital from his youthful accession, placing an image of Christ Emmanuel on his coins, and enjoyed the praise of encomiasts for his vigour and energy. These he expressed in the field, since he was committed to his father's policy of aggressive campaigning in the east. This required stability in the west, which was guaranteed by cooperation with Germany. His marriage in January 1146 to Bertha of Sulzbach, the sister-in-law of the German emperor Conrad III, sealed a Byzantine alliance with the Germans that lasted until *c.*1156. The professed common ambition of both imperial powers was to eliminate the Norman presence in southern Italy.

After 1160 Manuel was increasingly preoccupied with the pretensions of the German emperor Frederick I Barbarossa (1152–90). In the aftermath of the Second Crusade (1147–48), western and eastern concerns were more intimately linked, and the rhetoric produced at Barbarossa's court promoted the notion of a unified Christendom under the suzerainty of the German "Holy Roman" emperor. Manuel responded with his own ecumenical rhetoric, which he backed up with grand gestures and actions. This had significant ramifications in the east, where to further his own claims and interests Manuel was willing to forge alliances with both the Latins of the crusader principalities (for example by his second marriage to Maria of Antioch at Christmas 1161) and the Turks (a treaty with the Seljuk sultan Kilij Arslan in 1162). Manuel's grandest gestures were the aborted assault on Egypt in 1167 and the march to Iconium in 1176, both undertaken in support of the crusading princes and intended to bind them more closely to him. Both were unmitigated failures, and the latter resulted in a devastating defeat at Myriokephalon. If we no longer believe that either Barbarossa or Manuel fully intended to fulfil the claims of their panegyrists, we must still concede that they believed each other's propaganda, fuelling the "cold war" that prevailed for most of the period 1160–80.

Manuel has been considered a "Latinophile", and a survey of his foreign-policy ambitions reveals a clear Latin (if not always western) bias. While we cannot countenance the notion that his actions precipitated the crisis of 1204 – a proposal first articulated by the 13th-century historian Niketas Choniates, and revived in the 20th century by Ferdinand Chalandon – Manuel's achievements in the west were certainly ambiguous. His preoccupation with Germany led him to advance the empire's frontier across the Danube, and to make inroads into Italy and Hungary through strategic use of force and aggressive diplomacy. Meanwhile, however, smaller powers gained ground in the Adriatic and Mediterranean. Hungary made much progress in the northern Balkans, and the Venetians were able more freely to switch allegiance between Byzantium and Germany, while advancing their own interests in Dalmatia and the Holy Land. The Normans never suffered a joint Byzantine–German assault on southern Italy, and the shift of attention after 1160 allowed William I and William II further to consolidate their authority in Sicily and Apulia. Within the northern Balkans regional and municipal potentates benefited from Manuel's "chequebook diplomacy", without committing themselves fully to his cause. Soon after 1180 the semiautonomous regions of Bulgaria and Serbia became independent kingdoms.

We have two full narrative accounts of Manuel's reign, by John Kinnamos and Niketas Choniates, which are in turns complementary and contradictory (so much so that it is likely that Choniates had read and determined to refute many of Kinnamos's claims). However, the fullest account of Manuel's activities is contained in the panegyrical orations delivered by Manuel's encomiasts. The so-called "Manganeios" Prodromos provides the largest dossier on events before 1160, presenting a rhetorical image that far outstrips even Kinnamos's eulogistic biography. Manuel's image as a conquering warrior owes much to the ideals developed by his father's image

makers, and he emulated and developed John II's triumphal processions through Constantinople. According to encomia produced for these occasions, Manuel surpassed John, indeed all his predecessors, and his victories are greater than his father's, greater even than his Roman or mythical forebears. His deeds are compared favourably to those of great leaders and warriors of myth and history.

Manuel's martial prowess, and his victories across the frontiers of his empire gave him much-needed kudos in his early years, demonstrating the importance of foreign policy for domestic consumption. Much of this show was directed at impressing his own magnates, and most of all the increasingly divisive ranks of his closest kin, the *sebastoi*. Manuel made full use of his palaces, particularly the development at Blachernae where building work continued apace, and the walls were decorated with frescos of his vanquished foes and prostrate subjects. The walls of his subordinates' houses were similarly decorated, and one, Alexios Axouch, was notoriously condemned for choosing instead to decorate his residence with pictures detailing the exploits of the Seljuk sultan.

After 1160 Manuel sought also to project his image beyond Constantinople, to confront the wider world with his imperial vision in their own courts: the papal curia in Rome, the Hungarian royal court at Esztergom, in the streets of Antioch and Jerusalem, or even improvised tribunals in the Serbian highlands. The ideological foundation for his foreign policy in the second part of his reign was his claim to be "king of kings", the sole Roman emperor recognized by the papacy and by subordinate rulers within and beyond his borders. He backed his claims with actions, and demonstrated his suitability to preside over a hierarchy of Christian rulers by his tolerance and philanthropy in Dalmatia and Italy, and by a moderate policy towards Hungary and the crusader states. Manuel's ecumenical claims, and antique pretensions, are expressed clearly in his conciliar edict of 1166, preserved in an inscription (a plaster copy of which is displayed today in the outer narthex of Hagia Sophia in Istanbul).

It is of great significance that Manuel was remembered fondly in the peripheral lands of the empire as a fine Christian emperor, a powerful general, and a liberal distributor of largesse. The citizens of the Dalmatian cities spent his money gratefully, as no doubt did the Russian princeling Vasilko who was granted authority over four major trading cities on the lower Danube. And his reputation for generosity spread further afield: Robert of Clari, a participant in the Fourth Crusade, heard it told that Manuel was "a most worthy man and the richest of all Christians who have ever lived, and the most generous. Never did anyone ask him for anything of his ... but that he would give him a hundred." Manuel's fine reputation lived on as a contrast to those of his successors, and the wealth that he had been able to amass from his extensive empire, larger than at any time since the reign of Basil II, was soon to pass into other hands even before the advent of the Fourth Crusade.

Shortly before his death Manuel took the monastic name Matthew. He was buried in his father's foundation, the Pantokrator monastery in Constantinople. Cyril Mango has identified the lid of his sarcophagus, carved in the shape of a church with seven domes, in a drawing of 1750 (reproduced in Mango, 1993). A poetic epitaph for the emperor has been preserved in the *Geography* of Meletios of Ioannina (died 1714), which records the features of the monastery.

PAUL STEPHENSON

Biography

Born in Constantinople in 1118 the son of John II Komnenos, Manuel came to the throne in 1143 despite having an elder brother living. He spent the first part of his reign campaigning in the east and the second part dealing with the German emperor Barbarossa. Manuel enjoyed great success in the field but was defeated by the Seljuks at Myriokephalon in 1176. He died at Constantinople in 1180.

Manuel II Palaiologos 1350–1425

Emperor

Manuel II (1391–1425) was the second son of the emperor John V and Helena Kantakouzene. Not destined for the throne, he received an exceptionally fine education. By the age of 20, with the title of despot, he was given responsibility for governing Thessalonica, and it was from there that he went to Venice to assist his father after his elder brother, Andronikos, as regent in Constantinople, had denied help with John's foreign debts (1370). Andronikos's further treachery prompted John to replace him in the succession with Manuel (1373) but, in a settlement following an abortive coup by Andronikos (1382), Manuel was displaced again. He then established himself independently in Thessalonica, taking a vigorous stance against the aggressive Turks until they drove him out of the city (1387). After a brief disgrace, he recovered favour by aiding his father against the attack of Andronikos's son, John VII (1390). When his discredited father died (16 February 1391) Manuel secured the throne. The following year he took as his wife the Serbian princess Helena Dragaš.

By the end of the 14th century the Byzantine empire was reduced to the city of Constantinople and small, scattered subject territories. It survived only through humiliating vassalage to the Ottoman Turks, as they extended their conquests in the Balkans. Manuel maintained his father's policy of subservience as long as he could, until the arrogance of sultan Bayazid I drove him into a break (1393). As the Turks

Manuel II: portrait of the emperor on a silver hyperper, early 15th century, Barber Institute, Birmingham

began a debilitating siege of Constantinople (1394), and when the so-called Crusade of Nicopolis (1396) failed in its attempt to end Turkish power in the Balkans, it seemed only a matter of time before Bayazid would take the great capital city and end the Byzantine state.

Hoping that the Latin powers of western Europe could be persuaded to send military aid to save Byzantium, Manuel undertook a virtually unprecedented journey of appeal to the west (1399–1403), during which he visited parts of Italy, Paris, and London. But western Europe's own problems (the Hundred Years' War, the Great Schism) and internal distractions forestalled any actual help. It was only the unexpected defeat and capture of Bayazid by Timur at the Battle of Ancyra (28 July 1402) that gave Byzantium a reprieve. Manuel returned home to involve himself in the 11-year struggle for the Turkish succession, fortunately backing the winner, Mehmet I, with whom he established amicable relations that sustained an outward truce.

But Manuel had no illusions about the longterm threat of the Turks, and he laboured to shore up his depleted realm. Ending his family feud with his nephew John VII, he devoted particular attention to safeguarding the Byzantine position in the Peloponnesian Morea, ruled by his brother and then his own son. Manuel himself spent a year there (1415–16), restoring the famous Hexamillion fortifying the isthmus of Corinth and putting down internal rebellion. Following that, he had his eldest son, the future John VIII, spend a military apprenticeship in the Peloponnese, winning territory from the neighbouring Latin powers there.

At the same time, and despite outward peace with the sultan, Manuel renewed appeals to western powers to send aid against the Turkish threat before it was too late. The possibilities of ecclesiastical reunion with Rome were dangled as bait, but the western Church leadership was too preoccupied with other matters at the landmark Council of Constance (1414–17) to deal with the issue. Subsequent contacts between Manuel and the new pope Martin V revealed that Church union would be far more complicated than a mere submission of suppliant Constantinople to domineering Rome and would require the formal mechanism. Though such a pursuit would subsequently be taken up by Manuel's successor John VIII, he himself regarded union as but a diplomatic bargaining point, something too unacceptable to the Orthodox community to be pursued to actual conclusion. Manuel did, however, open other doors to the west by arranging Latin marriages for his sons John and Theodore.

Manuel's cautious outward policy of accommodating the Turks was challenged by his son John, crowned co-emperor in 1421. Manuel wearily allowed John the initiative. His misguided overreaching brought down the wrath of the new sultan, Murad II, on Byzantine territories. A fierce but short-lived siege of Constantinople itself (summer 1422) was beaten off, partly because Manuel – who resumed control of the government – created diplomatic distractions for the sultan. But Manuel soon suffered a stroke (1 October) that left him effectively paralysed for the rest of his life. John took over full control of the government, not always with the full confidence of Manuel, who found his son more ambitious and pretentious than the pathetic state of their realm justified. As his health declined further, Manuel adopted the monastic garb on his deathbed (taking the name of Matthew), and died on or around 21 July 1425, aged 75. His funeral was the occasion of an unprecedented outpouring of grief by his apprehensive subjects.

Manuel was a remarkable personality by any measure. His political and diplomatic skills were worthy of the empire's earlier, greater days, when he would have been a magnificent sovereign; given his circumstances, his steering of his ravaged realm through its declining perils still ranks him as Byzantium's last truly great ruler. A superlative politician, he was also one of the leading cultural figures of his age, an outstanding example of the Byzantine type of the intellectual emperor. From early youth he acquired a hunger for learning and a facility in letters, thanks to his teacher, the leading Byzantine intellectual of the 14th century, Demetrios Kydones, who remained his friend to the end of the latter's life. Manuel himself has left us a large and significant literary legacy, including a collection of fascinating letters, writings for and about his family, theological efforts, occasional pieces, and a range of rhetorical exercises, all composed in the loftily complex and obscure style beloved of Byzantine savants.

From all accounts, Manuel was an individual of warm personality and noble character. A handsome man of great physical presence, even into his later years, he impressed all who encountered him. During his long stay in Paris, French artists became fascinated with his appearance and used his image as a model for representations, in painting and medallions, of the Magi, of the earlier emperors Constantine and Herakleios, and of the German emperor Charles IV. He was also the last emperor to receive first-class portrayal in Byzantine art: two manuscripts now in Paris preserve splendid images of him in imperial glory, in a solo portrait in a copy of his funeral oration for his brother Theodore (in the Bibliothèque Nationale), and in a family portrait (with his wife and their three eldest sons) in a manuscript of Dionysius the Areopagite (in the Louvre).

He was equally proud of his "Roman" imperial dignity and of his pure Orthodox faith. His personality and achievements represent perhaps the last great flourishing of the Byzantine embodiment of medieval Hellenism.

JOHN W. BARKER

Biography

Born in Constantinople in 1350, the second son of John V, Manuel received a good education. He ruled Thessalonica as despot from 1382 until 1387. He succeeded as emperor in 1391 and in 1392 married Helena Dragaš of Serbia. He toured western capitals in the hope of gaining military support for Byzantium and he established good relations with the sultan Mehmet I. He also left a significant body of writings. He died in Constantinople in 1425.

Manuscripts

Manuscripts in the technical sense of hand-written documents on a variety of supports have been produced in the Hellenic world since writing was first used in earliest times, and have continued in production up to the present day. Included under this heading, therefore, could be pottery fragments (*ostraka*) from Hellenistic Egypt containing short notes or messages, a luxury copy of the Psalter made for a Byzantine emperor around the year 1000, and an annotated draft of Kazantzakis's *Odysseia* (first printed in 1938). Such a range of material is so vast and heterogeneous that some narrowing of focus is generally considered helpful if it is to be surveyed. Yet even the term "Greek manuscript" as usually understood – that is, to refer to primarily literary material of, roughly speaking, the last two millennia – still embraces a huge field. The interest and importance of the manuscript in the Hellenic world, however, is not due merely to the size and scope of the theme, but to the fact that it provides most of our knowledge of that world before modern times. If we set aside, for purposes of discussion, the visual, topographical, and archaeological evidence of the past, it can be asserted that Greek manuscripts are not merely the prime source of literature in Greek, they are in a crucial sense the prime source of the history of things Greek.

Most surviving Greek manuscripts are written on parchment, sheets of animal skin prepared according to a formula reputedly invented in Hellenistic Pergamum (from which the word parchment, *pergamene*, is derived). Parchment gradually supplanted papyrus as the writing support of choice in the early centuries AD, and was on occasions replaced by paper of Near Eastern manufacture from around the 9th century, and more generally by western (primarily north Italian) paper from around 1300. Together with the replacement of papyrus by parchment came the replacement of the (horizontal) scroll by the folded, gathered, sewn, and bound book (or codex) that still remains today an indispensable aspect of our culture. This development also took place in the Hellenized world of the eastern Mediterranean and its hinterland, and is often linked, albeit loosely, with the growth and spread of Christianity. Taken together, the invention of parchment – with its extraordinary durability – and its use in the convenient and commensurately durable codex must rank among the most far-reaching contributions of Hellenic culture. It is no exaggeration to say that not only would our knowledge of the history and literature of the past be very scant without the contribution of parchment codices, but without such books that history and that literature would themselves have been altogether different.

The vast preponderance of manuscripts written in Greek that have survived (more than 60,000) date from the Byzantine period (*c.*324–1453), although we have many earlier fragments of papyrus (generally very small in scale), and the production of significant numbers of manuscript books, notably in the monasteries of Mount Athos, continued into modern times. Undoubtedly vast numbers of manuscripts have been lost over the centuries, but it is important to bear in mind that this loss has not affected all types of manuscripts equally. In particular we can assert that the more important a book was perceived to be at any time, the greater were the chances that it would be preserved.

The manuscript book is eminently portable, and while this may on occasions ensure its preservation (snatched from a fire that destroyed the building in which it was housed, for example), it is always a complicating factor in seeking to understand what such manuscripts can tell us. The turbulent political history of the lands that once formed part of the Byzantine empire is a further complication. The largest numbers of Greek manuscripts are now to be found in the Vatican Library in Rome and the Bibliothèque Nationale de France in Paris, with major holdings in libraries in many other countries, including Greece; but there are only a small number of such manuscripts still in Istanbul, even though for a thou-

Manuscripts: gospel illumination of St Luke writing at his desk, 12th century, National Library, Athens

sand years (as Constantinople) the city must have been the most important centre for the production and consumption of such books. Whereas the medieval holdings of monasteries and other religious houses in Britain, for example, can be extensively reconstructed, nothing comparable can be done in the former Byzantine lands (except perhaps in part for the library at Patmos). It is well known that the famous Codex Sinaiticus in the British Library was taken from St Catherine's Monastery by von Tischendorf in 1859, presented by him to tsar Alexander II, and in 1933 purchased by the British Museum from the Soviet government for £100,000, raised by public subscription. Yet exactly where, when, and under what circumstances this great bible was made in the decades around 400, and how and when it came to Sinai, are matters on which we are uninformed. There are very few surviving Greek manuscripts of any period about whose precise origins in the Hellenic world we can speak with confidence.

Manuscripts preserve and transmit information. Some are by intention linked to a specific historical moment without the expectation that they will subsequently be copied, and hence transmitted, whether horizontally (so to speak) in order to reach a wider audience of contemporaries, or vertically, to ensure preservation and use by future generations. Charters and documents of all sorts (even if produced in duplicate or triplicate) are a good example of this time-bound category. Various monasteries on Mount Athos, for example, preserve imperial charters originally authenticated with a gold seal (hence *chrysobull*), along with other documents relating in particular to the management and ownership of land and other resources. Some idea of the losses in this area can be gauged, paradoxically, by the survival (and rediscovery through archaeological or chance excavation) of tens of thousands of detached lead sealings, most dating from the 6th to the end of the 12th century. The Byzantine world was a hureaucracy par excellence, in which the production of documents of all sorts, testifying to the power of the written word, was highly developed.

The largest subcategory of Greek manuscripts includes all those more self-consciously "literary" forms of writing, such as history, drama, philosophy, poetry, mathematics, theology, astrology, exegesis, geography, geometry, hagiography, homily, liturgy, politics, rhetoric, myth (all of these categories still defined, it may be noted, by Greek words), medicine (for which a Latin term came to be preferred), together with the New Testament (composed in Greek) and the Old Testament (already translated into Greek for the use of Hellenized Jews in the last centuries BC). The single most important point to note in this context is that, with a few striking exceptions from the Byzantine era, even the earliest surviving manuscripts of these texts do not preserve versions produced under authorial supervision, but are later copies at a number of removes from a postulated "original", a position that causes particular problems, and prompts the adoption of specific approaches. Some of these removes might be termed technological. It is apparent, for example, that a text preserved during antiquity on one or more papyrus rolls will have survived to modern times (unless in a favoured archaeological context, such as the recently discovered Derveni papyrus, for example) only if copied into a parchment codex. A further crucial sorting occurred as a result of the increasing use in manuscripts of a formal minuscule bookhand, from around 800, in place of the stately majuscule scripts of earlier centuries (cursive scripts had long been used informally). Any text not transcribed in minuscule in, for the most part, the 9th or 10th century, stood little chance of being transmitted into modern times. We thus owe to a relatively small number of intellectuals of the Byzantine world, some known to us by name such as patriarch Photios of Constantinople (d. 891) and archbishop Arethas of Caesarea (d. *c.*935), most of what we know of the writings of the pre-Christian Greek world. The only surviving manuscript to contain all 11 known plays of Aristophanes, for example, was produced in the mid-10th century (it has been in Ravenna since the 16th century). Along with this activity went works of lexicography and anthology in which were preserved (generally as excerpts) many texts of which no more complete version now exists.

The act of copying a text in a parchment manuscript, because of the high cost of the materials (not to mention any costs associated with the scribe's lengthy work), implies certain prerequisites. In particular it presupposes a demand: such books were always made in response to a specific commission, not "on spec". Once made – and this point is too easily overlooked by those familiar with printed books and the modern situation – such manuscripts enjoyed very little "circulation", and hence were not in any broad sense "published" or even

"public". A liturgical book, it is true, would be read from to a congregation, and its text thus transmitted to a large audience, but the book itself, somewhat paradoxically, remained a private object to be consulted by one or perhaps two people at a time, although its covers could generally be seen if the book was displayed or carried processionally. The point is important when we consider the physical appearance of such books: their exteriors could make a public statement, but any interior elaboration of their content with images or decoration remained hidden from the view of all but a few specially privileged individuals. With numerous caveats it can be said that the number of copies of a text that have been preserved can thus be a very approximate indicator of the extent of knowledge of (and interest in) that text (or its images) in the society for which it was made.

The use of images in Greek manuscripts is one of their most intriguing and justly celebrated aspects. Christianity, in the period of its first triumphal development in and beyond the Greek-speaking world in the 4th to 6th centuries, became, to an extraordinary extent, a religion not merely of the word (i.e. the Gospel), but of the image (i.e. the icon in its broadest sense). Gradually, from the 5th century onward, this came to be reflected in religious books, where within a hundred years or so craftsmen had experimented with virtually every conceptual link between word and image that the bound book would permit (the frontispiece cycle, the marginal image, the literal illustration, and so forth), approaches that were then repeated throughout the Middle Ages in both East and West.

Because of the long and bitter iconoclast controversy in Byzantium (*c.*730–843) the use of images in religious books in later centuries was always carefully considered. Images in Byzantine manuscripts were never merely alternatives to words, but made their own points and required viewing according to their own conventions. The evangelists, for example, were traditionally represented in copies of the gospels as saintly craftsmen, engaged in the production of manuscript books, sometimes transcribing the text from a scroll, or surrounded by the paraphernalia of the workshop: pens, inks, knives, etc. An image of an event from Christ's life was not primarily an aide-memoire, or merely a focus for prayer, but a statement of theological truth: it affirmed the historical reality of the Incarnation, demonstrated that the Godhead could be represented and circumscribed, and was held to be a traditional aspect of Christian activity that had originated in apostolic times. The vast repertory of images found in such manuscripts has sometimes been regarded as providing insights into a lost world of images of earlier centuries, but the situation is problematic, and the approach questionable.

Greek manuscripts have been systematically collected in the west since the 15th century, notably under the influence of various enthusiasms: humanist, biblical, scholarly, museological, acquisitive. Their current dispersal is as great as (perhaps greater than) the Greek diaspora. At any one time, however, only a tiny proportion of the surviving material is on temporary or permanent exhibition. Some of the contents of these manuscripts has been absorbed over the centuries into the very foundations of western consciousness. But a surprising amount, especially of the religious literature of Byzantium, is unpublished, and much of it is still untranslated. Although scholars and collectors no longer scour the monasteries of the Levant in the hope of finding some hitherto unknown masterwork of Classical Greek literature, Greek manuscripts still have many secrets to yield to new research.

Manzikert, Battle of

Battle fought between Seljuk Turks and Byzantines in 1071

Manzikert (ancient Arzashkun, then Menuaskert; Armenian Manazkert) is a village in the ancient Armenian homeland, some 30 km to the north of Lake Van in the region of Taraun (or Taron). Never a major centre in classical Armenian times, it is nowadays only a small town in eastern Turkey, known as Malazkirt. Its name is remembered today (in Graeco-Armenian form) almost exclusively as the locale of one of the most significant battles in the history of the Byzantine empire.

A recurrently strategic point in the centre of Armenian territories, Manzikert was located in the areas of ancient Perse-Armenia that, since the 5th century AD, had been in dispute as spheres of interest between the eastern Roman empire and first the Sassanian Persians, then the Arabs. In the 9th century it was the seat of an Arab emirate. By the late 10th century it was passing back and forth between the Armenian and Georgian Bagratid dynasts, and in 1000 it was part of the territories annexed by the emperor Basil II in an early phase of the Byzantine dismantling of the Armenian realms (completed in 1045).

This Byzantine territorial expansion eliminated an important buffer zone by extending the empire's frontiers eastward and exposing them almost immediately to the first raids by Turkish and other forces under the leadership of the house of Seljuk. Such raids turned into more systematic campaigns of conquest, reaching a climax in the Turkish capture of the Armeno-Byzantine capital of Ani in 1064 and the final destruction of the old Armenian world. This mounting menace to the empire's eastern Anatolian lands came, moreover, at a time when the Byzantine government was allowing its military resources to fall into decay, leaving it perilously vulnerable.

A crisis in the Doukas regime in Constantinople prompted in 1068 the elevation to the throne of the military emperor Romanos IV Diogenes. An experienced soldier, Romanos attempted to revitalize Byzantine forces and mount a counter-offensive, despite the court intrigues against him. Organizing a major effort to clear Anatolia in the summer of 1071, he moved to confront the Seljuk sultan Alp Arslan in a showdown. The Byzantine army was deceptively large – at least four times the size of the Turkish forces, according to some estimates – but in fact an unstable assemblage in which limited and insecurely loyal native forces were joined by a motley array of foreign units (Frankish, Russian, Turkish, etc.). Unwisely dividing these forces, Romanos led his reduced army into battle near Manzikert on either 19 or 21 August 1071. Using clever and mobile tactics, the Seljuks were aided by the desertion of the emperor's Turkish auxiliaries and the insubordination of Andronikos Doukas, whose withdrawal from battle at a crucial point on the second day caused the collapse of the Byzantine army. Though fighting valiantly, the emperor was captured: treated courteously, he was obliged to sign a relatively moderate treaty of peace on Turkish terms. On his way back to Constantinople, however, Romanos was betrayed by his rivals there, deposed, and blinded.

Usually represented as a catastrophic landmark in Byzantine history – leading to the loss of Asia Minor, part of the empire's heartland – the Battle of Manzikert was not in itself a military disaster of great magnitude, either in manpower losses or immediate territorial transfers. But, with hindsight, its aftermath proved crucial. For the next ten years the Byzantine government was hopelessly ineffectual, so that there was no opposition to the Turks' penetration of Anatolian territories, with their Turkmen and other allies. The invasions of earlier centuries, by Persians and Arabs, had always taken the main highroads to strike directly at major cities and, eventually, Constantinople itself, while the isolation of the geographically and topographically fragmented hinterlands had escaped systematic occupation. Now, however, broad areas of the whole region could be overrun with impunity, and the process of destroying its Hellenic and Christian culture was initiated. Occupying perhaps two-thirds of Asia Minor, the Seljuks created a regional sultanate whose first capital was Nicaea, perilously close to Constantinople; after its recapture in 1096 by Alexios I and the forces of the First Crusade, the sultanate relocated in Ikonion, where it was to endure as late as the 14th century. The definitive loss of most of Asia Minor by Byzantium as a result of Manzikert was not truly confirmed until 1176, when the emperor Manuel I was disastrously defeated by the Seljuk sultan at Myriokephalon, and any serious hope for Byzantine recovery of the Anatolian heartland was thereby lost for good (though the northern and western territories were retained for some time thereafter).

Accordingly, the Battle of Manzikert assumes its ultimate significance only in retrospect, as the death sentence for Hellenic Asia Minor – a verdict whose reversal was sought as late as the Anatolian campaign mounted in 1922 by the modern government of Greece. Moreover, the date of Manzikert, 1071, is also the date of the loss of Bari, the last Byzantine stronghold in Italy, as the climax of the Norman conquests there. Taken together, these two events symbolize the definitive turn of Byzantium into its long centuries of decline and collapse thereafter.

Summary

The Battle of Manzikert was fought in 1071 between the emperor Romanos IV Diogenes and the Seljuk sultan Alp Arslan to secure the Byzantine empire's eastern Anatolian borders. Though superior in numbers, the Byzantine army collapsed and the emperor was captured; though later released, he had to accept Turkish terms for peace. The battle paved the way for the Turkish capture of Byzantine Asia Minor.

Mar Saba

Greek monastery in Palestine

The monastery of Mar Saba, on the east bank of Nahal Kidron, southeast of Jerusalem, is the earliest and best known of the Sabaite Greek Orthodox monasteries of Palestine. In AD 478 Sabas, the founder of the Sabaite monastic order in Palestine, established his residence in a cave on the mountain on which the monastery was later built. This monastery was to have huge influence on the subsequent development of Orthodox monasticism within Palestine. Its history is intimately connected to the history of its charismatic founder, Sabas, whose dedication and commitment to monasticism effected dramatic results on Palestinian monastic life.

Sabas was born in Cappadocia in 439, to a family of distinguished Christian descent. From the age of 8, he grew up in the Flaviana monastery, near his birthplace, and received the formal education and training of a monk. Already by an early stage of his education he had learned the regulations of the communal life of monks, and was fully accustomed to the monastic life. In 456, at the age of 18, he left for Jerusalem with the intention of spending his life as an eremetic monk in the Judaean desert. While in Jerusalem, he rejected offers to join one of the city's monasteries, and, determined to live as a hermit in the desert, he sought the counsel of St Euthymius, whose life he wished to emulate. Having joined Euthymius' order in 457, Sabas was sent to the coenobium of Theoctistus, where he spent the next 12 years as a monk. In 469, at the age of 30, he was granted permission to live outside the coenobium in a cave as a hermit. Five days of each week were spent in solitary prayer and contemplation; for two days he rejoined his fellow monks in the coenobium. Following the death five years later of Euthymius, and, one week after that, of his successor Domitian, Sabas, now 35, departed from the order. This set him off on the path by which he would ultimately become the founder of his own order and the spiritual leader of all Orthodox Christians in Palestine.

In 478 Sabas arrived in the region of Jebel Muntar, the highest peak in the Judaean desert, the area in which most later Sabaite monasteries would be built. According to tradition, an angel directed Sabas to the east bank of a tributary of the Nahal Kidron, where he discovered the cave that was to become the core of the Mar Saba monastery. Sabas spent five years in the cave (478–83), after which the area grew to become the physical centre (the Great Lavra) of his order. Over the next two decades a complex of buildings grew up around the site that came to be the Mar Saba monastery. This small cave on the Nahal Kidron was thus both the physical and spiritual centre for Sabas's monastery and his followers. Of Saba's earliest disciples, five went on to become founders and leaders of other Sabaite monasteries: James, who founded the Lavra of the Towers by the Jordan river; John, who ultimately became the head of the New Lavra; Firmius, who founded the lavra near Mikhmas; Severianus, founder of the monastery near Kaparbaricha; and Julian, who founded the lavra of Neelkeraba near the River Jordan. Sabas and his followers together established 13 monasteries, thus dramatically changing the nature of both the Judaean desert and early Orthodox monastic development.

The Great Lavra, the Mar Saba monastery built around Sabas's cave, came to hold a position of leadership within the see of Jerusalem. First and foremost, it was significant as the anchor and foundation for what was to become a widespread and growing monastic tradition within Palestine. Moreover, the influence of Sabas himself and the Mar Saba monastery was such that the monastic tradition as a whole came to be well respected and regarded throughout the region. Over time, the Sabaite monasteries grew to be thriving centres for literary and theological activity, and to enjoy a superior reputation not just in the region, but in the west, particularly the Balkans, as well. Sava of Serbia (1175–1235), who founded the autocephalous Church of Serbia, received his training at Mount Athos, and upon becoming a monk took Sabas's name as a token of his reverence and admiration. Sava himself visited Jerusalem and the area's Sabaite monasteries on two occasions, and the reverence in the Balkans for Sabaite Palestinian monasticism endures to this day. So too does Mar Saba itself, which remains an active monastic centre, a living relic of 5th-century eastern monasticism.

Marathon, Battle of

Battle fought between Greeks and Persians in 490 BC

In 490 BC a large Persian expeditionary force under the experienced commander Datis landed at Marathon in Attica not far from Athens. The Athenians and their Plataean allies under Miltiades repulsed the invasion, and so won one of the most

famous battles in history. Not all agreed. The renowned historian Theopompus wrote that "the battle at Marathon was not what everyone keeps repeating it was, and all the other things that the city of the Athenians brags about and uses to dupe the Greeks" (in Jacoby, 1962, fr. 153, pp. 569–70; translation by the author). Hence the very nature and significance of the battle is worth reconsidering. In 490 BC an Athenian army some 10,000 strong confronted a much stronger force of Persian infantry and cavalry. The Athenians sent the runner Pheidippides to Sparta requesting help, but in the event they and their Plataean neighbours faced the enemy alone. At Marathon the Athenian and Plataean armies, under the command of Miltiades, waited drawn up in a strong position against which the Persians could not attack even with their superior numbers. Rapidly running out of time, Datis decided to sail direct against Athens. He chose the first night after the full moon to reembark his cavalry, a time-consuming process, and then the majority of his infantry. To cover his movements he stationed the rest of his troops where they could serve as a substantial rearguard. Datis' bold move was revealed by some Ionian deserters who approached the Athenian camp and said only "the cavalry is away". Fully realizing that Datis was withdrawing, Miltiades ordered his men to their places, ready to attack at first light. Dawn caught the Persians in the middle of their operations, without the time needed to embark their rearguard.

Miltiades promptly ordered the assault, the Athenians on the right and centre and the Plataeans on the left. Their centre was thin, but the wings deeper and stronger. Their line was equal in length to the Persian one, which strongly suggests that the numbers actually engaged were roughly equal, with the Persians probably enjoying some numerical superiority. Little is known of the Persian dispositions except that the Persians and Sacae, a warlike people from Central Asia, formed the very strong centre of the line, which was about 1600 m distant from the Greeks.

After a favourable sacrifice, the Athenians began their advance. Once within bowshot of the Persians, they charged on the run, the boldness of their attack taking the Persians by surprise and reducing the effectivenenss of their archers and slingers. Once engaged, the Persians broke the Athenian centre after hard fighting and then pursued the survivors. At the same time the Greek wings routed their opponents, whom they allowed to flee. The Athenians and Plataeans next swung their victorious wings against the Persians and Sacae, converging on the centre in a pincer movement. The Persian centre was already in some disarray owing to the absence of those still pursuing the defeated Athenians opposite them. The Athenians and Plataeans crushed both of the exposed flanks of the Persian centre, whereupon the entire Persian army broke and ran. Some fled towards the great marsh trying to reach the safety of their camp. In their confusion and terror they lost their way and became mired in the marsh, where they suffered their greatest losses. Meanwhile the Athenians pursued the remnant of the centre, cutting them down in their flight until some of them reached the sea. A fierce struggle swirled around the ships, which took on board as many fugitives as possible before shoving off the beach. Although the Athenians failed to stop them, they nevertheless captured seven ships. The casualties were stunningly uneven. The Persians lost some 6400 men, a high proportion of those engaged. Of the Athenians, 192 fell, primarily those holding the centre of the line. Plataean losses are unnoted. After cremation, the Athenian dead were buried in the Soros and the Plataeans in a tumulus nearby.

Miltiades forestalled Datis' dash to Athens by a forced march. Thus thwarted, the Persian fleet returned to Asia Minor. The campaign of Marathon was over. Nonetheless, controversy still surrounds the Persian cavalry. Herodotus repeatedly emphasizes the importance of cavalry in Persian planning, but no ancient source, literary or epigraphical, mentions horsemen in combat at Marathon, hence they could not have been a factor in it. Their absence is further proof that the battle was a rearguard action.

The Athenians celebrated their victory in an outpouring of literature and art that still inspires today. The glory was not solely Athenian, but Greek. In literature they crafted the famous Marathonian epigrams, brilliant gems of poetry that commemorated the day when Athenian soldiers "saved Greece from seeing the day of slavery". Even the great tragedian Aeschylus adorned his tombstone not with allusions to his plays but with the notice that he had fought at Marathon. In art the Athenians honoured their patron goddess and themselves by minting exquisite silver tetradrachms portraying Athena crowned with an olive wreath, a sign of simplicity that contrasts with oriental pomp. Prominently displayed in the Stoa Poikile in the Athenian Agora was a dramatic painting of the battle depicting its progress from the outset through the clash of the two armies to the destruction of the Persian force. The most splendid monuments of the victory were architectural. The Athenian treasury at Delphi, which still stands in quiet beauty and dignity, was built from the spoils of the battle. On the Acropolis of Athens stands the Ionic temple of Athena the Victorious, small, elegant, a graceful memorial to a fateful day. Even the modern marathon races of 26 miles have their inspiration in the run of the Athenian messenger who brought news of the victory from Marathon to Athens.

In one sense, Theopompus was right. The battle about which Athens so boasted was not quite the supreme victory that it claimed. It was instead a splendid rearguard engagement of grand proportions. The significance of Marathon was indeed military, but it was also a symbol of the pride of the Greeks in their way of life and a justification of their love of freedom. That is also the legacy of Marathon to the world today, and the years have not dimmed it.

JOHN BUCKLER

Summary

The Battle of Marathon was fought in 490 BC between a Persian invading force under Datis and the Athenians and their Plataean allies under Miltiades. The Greeks caught the Persians unawares as they were trying to withdraw and routed them. Persian losses were heavy (6400), Athenian losses very few (192). By a forced march Miltiades reached Athens before the Persian fleet, which promptly sailed away. Marathon symbolizes the pride of the Greeks in their way of life and their freedom.

Marble and other decorative stones

Many different decorative stones were used by the ancient Greeks and Romans for construction, sculpture, and small items. The sedimentary rocks, limestone and gypsum, were most important in construction, but the most significant and evocative material was the metamorphic rock marble. Igneous rocks, such as granite and lavas, were used in construction and for small items. We start first with the sedimentary rocks.

Limestone generally forms in the sea, from the accumulation of shells, some microscopic, or by direct chemical precipitation. Greece is particularly rich in limestone because 250 to 145 million years ago it was a region of shallow tropical seas, far from mountains, and limestone production is favoured in this environment. Most limestones are fine-grained and grey, but white, black, red, and even green varieties are known. Limestone is generally layered with beds a few centimetres to a few metres in thickness. The only important mineral in limestone is calcite (calcium carbonate), but the crystals are commonly too small to be seen. The calcite in some limestones is replaced by the related mineral dolomite. This produces a rock that is slightly harder than limestone, but otherwise very similar.

Although much limestone is uniform, breccias are common in many areas. They consist of angular blocks of limestone, set in fine-grained red mudstone. These are formed in limestone caves that are produced by the solution of rock in percolating rainwater. Blocks of limestone fall from the roof and accumulate on the floor of the cave, together with a fine red mud that is the insoluble residue of the limestone. The mixture is later cemented by calcite to form a solid breccia.

Travertine was another type of limestone exploited as a decorative stone and for construction. This commonly porous rock was deposited around many springs in ancient Greece, but has often been completely removed. It is fine-grained and grey when initially deposited, but may develop large crystals later. The fossilized remains of plants that grew around the springs are often preserved in the rock. It forms by the loss of carbon dioxide gas from the spring waters and the consequent precipitation of calcite. Stalagmites, stalactites, and dripstone form in caves in the same way and were also used sparingly as decorative stones.

Gypsum (alabaster) is a soft, pale brown, yellow, or pink rock that may be layered. It was used in Minoan times as a decorative stone in the palace at Knossos, at Akrotiri on Thera, and elsewhere, but soon lost favour. The rock is soluble in water and hence was used only inside buildings: gypsum blocks left open to the weather after the excavations have lost more than 1 cm of material in 30 years. Gypsum was obtained from quarries on the hill of Gypsadhes near Knossos and in the underground mines of Gortyn. It was formed by the evaporation of seawater when the Mediterranean dried up about 6 million years ago. Bands in the rock formed during deposition and were folded later by tectonic forces. The presence of calcite or dolomite impurities in some samples increases their strength and resistance to erosion. The finer-grained varieties of gypsum were used for facing stones and for floor slabs, whereas the coarse-grained varieties were used in columns. So-called "Egyptian alabaster" is actually a form of limestone.

Marble is limestone or, more rarely, dolomite whose structure and mineralogical composition have been changed by the action of heat and pressure (metamorphism). Quarry workers and some archaeologists often refer to a number of other softer rocks as marble as well, such as limestone, lavas, and serpentinite, but to a geologist only metamorphosed limestone or dolomite is marble. Marble was an important material for sculpture and building materials in antiquity because it was relatively easy to work, produced a fine edge, and was abundant in many parts of the Aegean region. The ancient Greeks were more interested in white or grey marble, but the Romans also exploited coloured marbles extensively.

Marble is produced in the earth at depths of several kilometres. The source of the heat is the natural increase in temperature with depth in the earth. As the limestones are buried under other rocks, the temperature increases at a rate of about 1°C for each 30 metres. The metamorphism induces the recrystallization of the calcite so that the crystals are visible to the unaided eye and can also lead to the formation of new minerals, and hence change the colour of the rock. The hot rock is much weaker than cold limestone, hence it is commonly deformed without cracking by natural stresses in the earth.

The textures of marble are a combination of those originally present in the limestone and those produced during metamorphism. Layering and breccias in the original limestone are inherited by marble, but metamorphism may deform or smear them. However, deformation can produce new layering and new breccias can form in caves in the marble, giving a myriad of varieties of textures, and textures within textures. Metamorphism can also produce another texture, veining. In the rock there is often a thin film of water between the crystals that is saturated with calcite in solution. If there is a sudden loss of pressure, or increase in stress, then a crack can open up that may soon be filled with relatively pure, white calcite. These veins are a good way to distinguish marble from limestone.

The colour of marble reflects the amounts of minor minerals present because pure calcite and dolomite are white. Red is produced by the mineral haematite, from iron oxide impurities. Grey and black are commonly due to graphite, produced during metamorphism from organic matter, such as plant or animal remains. These colours can also be produced by

Marble: fresh blocks cut for use in the current programme of restoration of the Parthenon

magnetite or manganese oxides. The presence of the minerals chlorite, muscovite mica, or serpentine gives green marbles.

White and pale grey marble occurs throughout the Aegean region, but was exploited extensively at only a few locations, for historical and geological reasons. The quarries of Attica supplied the white and grey marble used in Athens. Mount Penteli produced the best white marble, whereas the grey came from Hymettus, but both mountains contain white and grey. The best-known white marble of the Cyclades was that of Paros, known as *lychnites*, because it was mined underground by the light of a lamp. This marble is very pure so that quite thick pieces are translucent. Naxos also produced large quantities of a coarse-grained white marble. The quarries of white, dolomitic marble on Thasos were some of the largest in antiquity. Their exploitation reached a maximum during Roman times, when the marble was widely exported. Pale grey streaky marble from the island of Marmora was very popular since it could be extracted in large blocks.

The best-known green marble was known to the Romans as Marmor Carystium and more recently by the Italian name of Cipollino, because it resembles an onion in section. It was produced from a number of quarries in southern Euboea, around Carystus. It was used for monolithic columns, public fountains, and wall-facings in Roman and Byzantine buildings from the 1st century BC to the 7th century AD. It was widely exported all around the Mediterranean and as far as Britain. Cipollino is made of layers rich in calcite separated by layers rich in the green minerals muscovite and chlorite. Quartz and feldspar are also present and stand out from the other softer minerals after erosion.

Rosso Antico is a fine-grained, red to purplish red marble, with some varieties streaked with white veins and patches. It was first extracted from quarries on the Mani peninsula in Minoan and Mycenaean times, between 1700 and 1300 BC, for use in architecture and for stone vases. It was not in regular use again until about AD 50, when as Lapis Taenarius it is found in Roman and later in early Christian buildings, decorating walls and floors. Reused pieces were popular in the Middle Ages and later for floor decorations, and were frequently mistaken for imperial porphyry, an igneous rock from Egypt. The Rosso Antico quarries also yielded white, grey, and green marble, and were also exploited very early, for example in the treasury of Atreus at Mycenae.

Other variegated marbles were exploited at many locations, but in small quantities and mostly during Roman times. The best known were on Skyros, the Fior di Pesca of Euboea, the Africano of Teos, and the Portasanta of Chios. Yellow marble was imported from the imperial quarries in Tunisia.

Verde Antico is the name given by Italian masons, from the Renaissance onwards, to a green decorative stone that was first used in the 1st century AD, but was most popular in the 5th–6th centuries, after the imperial porphyry quarries in Egypt closed (about AD 450). Its ancient name was Marmor Thessalicum or Marble of Atrax. The quarries lie on a small hill beneath the western slopes of Mount Ossa, just north of Chasambali. Verde Antico is a conglomerate composed of rounded serpentinite and marble blocks set in a fine-grained matrix of similar composition (the geological term for this rock is ophicalcite). The rock is layered, with contrasting sizes and compositions of blocks in the different beds. The blocks were transported by rivers, but could not have travelled far because serpentinite is a very soft rock and hence erodes readily. Therefore, this rock probably formed very rapidly in a broad river valley surrounded by high mountains of serpentinite. This rock was not formed recently, but probably during the Tertiary period and is a variant of the conglomerates seen in the Meteora.

Of the igneous rocks both lava and granite were exploited in antiquity. A widely used green porphyritic rock was known to the Romans as Lapis Lacedaemonius, to Italian masons as Porphido Verde Antico, and to us as Spartan Basalt or Andesite. It was popular in Minoan and Mycenaean times for stone vases and sealstones and under the Roman and Byzantine empires for the decoration of walls and floors. According to Pausanias,"These stones were used for decorating temples, swimming pools, and fountains." Later, Roman and Byzantine stones were reused extensively, for example in St Mark's, Venice, and Westminster Abbey, London, until the late 18th century. Spartan Porphyry is a porphyritic andesite and comes from a lava dome 2000 metres long of mid-Triassic age (about 230 million years ago) near Krokeai, Laconia. Such domes form when viscous lava erupts quiescently on to the surface. The prominent crystals in the lava are plagioclase, now metamorphosed to a fine-grained mixture of albite and green epidote. Sometimes several plagioclase crystals started to crystallize from the same point, to give rosettes of crystals. In parts of the dome the fine-grained matrix of the rock has been reddened by the oxidation of iron minerals to haematite. This rock is generally highly fractured, with most blocks less than 50 cm in diameter. Similar porphyritic lavas were also exploited locally on Samothrace.

Granite was an important decorative material for the Romans and was traded widely throughout the Mediterranean. There were two major sources of granite in the Aegean: Marmo Misio (or Granito Bigio) from near Kozac, 15 km northwest of Pergamum, and Marmo Troadense (or Granito Violetto) from Mount Cigri, 10 km southwest of Ezine. Both rocks are grey, fine-grained, and principally composed of quartz, feldspar, and biotite. Both intrusions are about the same age as the volcanic rocks in the region. Plutonic rocks such as granite and lavas such as imperial porphyry from other Roman imperial quarries were imported into Greece in small quantities, especially from Egypt.

It is only recently that the susceptibility of marble and limestone to erosion by pollution has become a problem. The most direct problem is the solution of the mineral calcite in the marble by strong acids (for example sulphuric and nitric acids) present in polluted rain. Some acid gases in the atmosphere also directly attack marble. The most common end product is gypsum, which is more soluble in water than calcite. The transformation of calcite to gypsum also involves an increase in volume, hence the surface of the marble flakes off. Another problem relates to algae that live just below the surface of the marble. They feed off petroleum products deposited from the air and produce acid waste products, with the same results. Sandstones cemented with calcite are also attacked in the same way.

Mardaïtes

The Mardaïtes appear in the 7th century as inhabitants of the Amanus and Taurus ranges on the borders of Syria and Cilicia. Their origin is uncertain, though possibly Armenian or Persian, and they were undoubtedly Christian (but whether monophysite or monothelite is unclear). They were known to the Arabs as al-Jarajima after their stronghold al-Jurjuma. Most information on them comes from al-Baladhuri's and other Arab histories and Theophanes the Confessor's *Chronographia*, which last was used for and supplemented by Constantine VII Porphyrogennetos's *De Administrando Imperio*. Considerable uncertainty, however, still shrouds many of their activities.

The Mardaïtes are first heard of after the seizure of Antioch in 636–37 by the Arabs, who coerced them into agreeing to act both as irregular troops and as scouts to guard the defiles of the Amanus, with exemption from the poll tax and the right to battle spoils; but their loyalty was very precarious and they indiscriminately plundered both Arab Syria and Byzantine Cilicia. A major raid as far south as Jerusalem, in which they were probably aided by Constantine IV, was so successful that it not only encouraged fugitive slaves (probably Greek) and other malcontents to join them but also played a part, according to Theophanes, in forcing the Umayyad caliph Muawiya in 678 to abandon his siege of Constantinople and agree to a humiliating peace treaty to effect the withdrawal of Byzantine financial and military support from the Mardaïtes. Justinian II, however, subsidized a similar raid in the late 680s and thereby induced Caliph Abd-al-Malik, embattled by internal rebellions,

to follow Muawiya's precedent. This time, despite having to make substantial payments, the Arabs obtained a far more advantageous agreement through the stipulation that the Mardaïtes were to be resettled in Byzantine territory. Substantial numbers nonetheless remained to raid Arab lands, and Theophanes' "bronze wall" between the two powers was not effectively eliminated until al-Jurjuma was destroyed *c.*707 by Abd-al-Malik's son Maslama. Some survivors fled westwards into Byzantine Anatolia but many were transplanted to Syria, some being drafted without the demand for religious conversion into the caliphal army, in which they helped suppress rebellions in Iraq in the 720s. In Syria they gradually lost their individual identity and were absorbed, perhaps becoming components of the Maronite communities.

In accordance with the treaty, Justinian II removed, with their families, at least 12,000 and possibly eventually as many as 18,000 Maradaïtes, whom he enrolled as oarsmen in the *Karabisianoi* (the regular fleet established probably by Constantine IV a decade earlier and which had presumably hitherto depended on local levies). Whether or not their arrival prompted the immediate establishment of the themes of Kibyrrhaiotai and Hellas, in the early 8th century they certainly formed the major element of the former (a naval theme stretching from Cilicia to Miletus). One of the principal officials of Kibyrrhaiotai, appointed directly by the emperor, was known as the *catepan* (governor) of the Mardaïtes and resided at Attaleia in Pamphylia. Others were employed as oarsmen in Hellas, and when in the early 9th century the new themes of Peloponnesos and Kephalenia were created, their garrisons, presumably drawn from the Mardaïtes of the old theme of Hellas, were known as the Mardaïtes of the West. By the 10th century some were stationed in the theme of Nicopolis in Epirus, earlier probably a part of Peloponnesos. Most of the Mardaïtes' battle honours were won in wars against the Arabs in both the eastern and western Mediterranean.

A.R. LITTLEWOOD

Summary

Christian freebooters on the borders of the Umayyad Caliphate and Byzantine empire, Mardaïtes were used by both as guerrillas in the 7th century. After an invasion of Syria in the 680s many were resettled in Byzantine territory and served the empire as oarsmen. Others remained in Syria.

Marriage

Marriage has been a central cultural and economic institution of Hellenic society since antiquity and, while both the practicalities and the perceived function of marriage have undergone various changes, it has demonstrated a remarkable continuity through time. Indeed it has been claimed that the pivotal role of marriage and the family, together with religion, has been a crucial factor in sustaining Greek identity and culture, particularly through the Tourkokratia (see McNeill, 1978; Sanders, 1967).

For antiquity, and for Classical Athens in particular, marriage was informed by two dominant and purposive imperatives: first, the production of legitimate children (*gnesioi*, contrasted with bastards, *nothoi*) for the husband's *oikos* (household, family) and of legitimate citizens for the state; second, the formation and maintenance of social and interfamilial alliances.

The first point finds its mythical illustration in the Athenian legend of Cecrops who, long ago, "found men and women having sexual intercourse at random, so no son could identify his father, and no father his son" (scholion on Aristophanes, *Plutus*, 773). Cecrops rectified this promiscuity by inventing the institution of marriage. Here the critical concern was to clarify lines of patrilineal descent and inheritance, a concern important especially for democratic Athens where legitimacy of birth was a prerequisite of citizenship. The flowering of the Athenian empire in the 5th century BC and the concomitant importance of being Athenian were reflected in the state's unusually narrow marriage regulations; before Pericles' law of 450/51 BC Athenian birth was a requirement of the father only, but after this both parents of legitimate children had to be Athenian. Thus citizen marriage at Athens was endogamous, and exogamy could have legal consequences (Demosthenes 59, a prosecution from the 4th century BC which deals with an Athenian citizen allegedly living as if married with an alien woman, is a good example of the practical consequences of this law against mixed marriages). One product of the importance of legitimacy was the emphasis on female chastity. Brides were expected to be virgins (the Greek word *parthenos* denotes both the unmarried girl and the virgin, social and physical categories that, preferably, coincided) and wives were expected to be chaste.

Also important and perhaps a particular concern for the rich elite was the notion that marriage could forge ties, concentrating power and wealth within social groups. Despite anxieties about incest, endogamy extended to "keeping it within the family"; marriages between first cousins, niece and uncle, and even half-siblings were common and, in Sparta at least, marriage between uterine siblings was sanctioned (Philo, *On*

Special Laws, 3. 4. 22). Indeed kinship was a positive factor for marriage: one legal speech brings as proof of a family quarrel the fact that an uncle has not married his daughter to his nephew (Isaeus, 7. 11–12), while another describes the reciprocal giving in marriage of female relatives within a family (Demosthenes, 59. 2). Friendship obligations were important too: another speaker in court describes how his sister was given in marriage to a friend of his dead father as a favour (Isaeus, 2. 3–5). These cases highlight the fact that an Athenian girl was given in a marriage over which her male natal guardian (*kyrios*, normally the girl's father or, if he was dead, her brother) exercised a formal control; indeed a wife's natal *kyrios* had the power to revoke her marriage, demanding the return of both woman and dowry, and divorce and remarriage were frequent. It was possible too for women to be the objects of bequests in wills (Demosthenes, 27. 5; 45. 28; Diogenes Laertius, 5. 11–16).

Marriage then at Athens can be seen as a form of exchange between households in which women were given out, conditionally, to bear children for their husbands and citizens for Athens, and was crucial for the creation of new households, for the continuation of descent groups, for the city's stock of citizens, and for citizens themselves for whom only marriage provided legitimate heirs.

For women too marriage was crucial and was seen as the fulfilment of a culturally prescribed role, indeed as the only proper role available to women, a notion that has gone largely unchallenged until the very recent past. While temporary celibacy was required of priestesses during the period of religious office, no respectable alternative to marriage and motherhood was available to women, either social or biological – the Greek medical writers envisage a horrendous fate for girls deprived of sex and babies (see in particular the *Peri Partheneion*, part of the Hippocratic corpus which remained influential throughout the medieval period). So strong was the notion that marriage was the only fitting career for a woman that girls who died unmarried were commemorated as brides of Hades.

In ancient Greece the state played no formal role in marriage which was essentially a private arrangement between families. As a result, identifying the definitive moment of the marriage ceremony (*gamos*) becomes somewhat problematic; no state or religious official pronounced the couple married and there was no marriage certificate. The basic signifier of marriage may simply have been for a couple to live together as if married (*synoikein*), and lawcourt speeches of the 4th century BC concerned with legitimacy and inheritance attest to the potential difficulty of deciding whether or not a marriage had taken place. The act of bethrothal (*engue*), however, in which the bride was bestowed for the ploughing of legitimate issue, marked the first step of marriage for an Athenian, and only children born of a woman so betrothed, apart from those of an *epikleros* (heiress), were legitimate (Demosthenes, 46. 18; Isaeus, 8. 19). *Engue* was not an irreversible contract (there was no notion of "breach of promise"), but normally was followed by the *ekdosis*, the handing over of the bride by her natal *kyrios* to her new *kyrios*, her husband. *Ekdosis* could happen some time after *engue*; Demosthenes reports that his sister's marriage was delayed by ten years since she was an infant when betrothed, a reminder that girls were married young, ideally shortly after puberty, perhaps to ensure as far as possible the bride's virginity.

The bride dedicated her childhood toys and a lock of hair to Artemis, was bathed and veiled. Then followed the sacrificial wedding feast during which libations were made to the gods, particularly Hera, the goddess of weddings and marriage and whose own divine union with Zeus was celebrated throughout Greece. The bride was unveiled before her husband who accepted her with his right hand and led her to his house.

Marriage in militaristic Sparta differed markedly from that in democratic Athens. Spartan men were expected to marry in their twenties but lived apart from their families in all-male barracks until the age of 30, encouraged to visit their wives only occasionally, at night and by stealth. The Spartan marriage ceremony was characterized by the real or symbolic rape of the bride who, hair cropped and dressed as a boy, waited in the dark to receive her new husband. Spartan attitudes to female chastity also differed from those of the Athenians. Many texts suggest a more flexible marriage bond and a more relaxed approach to extramarital sex and, while the production of Spartiate soldiers was of vital importance to the state, Spartan custom held that all sons belonged in common to fathers and vice versa. This unconcern with legitimacy was related perhaps to Sparta's inheritance and landowning patterns; until the late 5th century BC the state controlled the allocation of land and thus the male line was not important, a good indication of the way in which marriage and marital behaviour reflect upon other political and social institutions.

Hellenistic Egypt reveals new emphases on marriage as a union of two individuals and on the sexual fidelity of both partners; an Alexandrian marriage contract from 92 BC insists that the husband may have neither concubines nor catamites (Tebtunis papyrus 104). Furthermore, the image of the married couple became a significant feature of Hellenistic rule. Marital alliances among the elite were a traditional feature of Greek society, not only of the royal houses of Sparta and Macedonia but also of aristocratic Athenians, but Hellenistic queens acting as their husbands' consorts, such as Arsinoë the wife of Ptolemy II Philadelphus, took the principle a stage further. Arsinoë was also Ptolemy's sister, and such unions were a strategy for consolidating power within one family, following the Egyptian model. In Byzantium several imperial brides, although not born royal, exercised considerable political and religious influence through marriage and motherhood, often wielding most power as widows. Irene in the 8th century was regent for 5 years, while in the following century Theodora II was regent for 14 years, both women achieving and maintaining power by manipulating their positions as wives and mothers.

Marriage remained the central role for women throughout the Christian era in a Church that esteemed motherhood highly, assigning to Mary the epithet *Theotokos* (Mother of God) at the Council of Ephesus in AD 431. Christian teaching introduced several changes to the ancient concept of marriage and, while the husband retained his superiority as head of the household, Christian men and women were subject to a greater mutuality of rights and obligations. Ecclesiastical marriage services became the norm throughout the empire and by the

9th century civil ceremonies were no longer recognized as valid.

The Church, however, offered a radical new role for both men and women, that of religious celibacy. In his First Epistle to the Corinthians Paul declared that celibacy was the highest good (although for those who could not aspire to such goodness marriage was necessary to contain sexual desire). Before this innovation lifelong virginity and celibacy were not considered feasible options for either sex; now for the first time Hellenic society was presented with an alternative to marriage. Yet such a role had a narrow application. While some early Christian writers urged men not to marry (for example Jerome, *Against Jovinianus*, 47), unmarried girls in particular who wished to opt for celibacy met frequently with family opposition and in the 4th century John Chrysostom in a denunciation of enkratic (enforced) virgins insisted that "marriage is honoured by all and the marriage bed is free from stain" (*De Virginitate*, 8. 2). The situation was easier for widows, such as St Theodora of Thessalonica, whose decision not to remarry the Church supported since it viewed marriage as a life commitment. For those who could not avoid marriage there was always the compromise of a "spiritual marriage" (that is, a celibate marriage, sometimes entered into only after the birth of a child).

The later Church supported convents for unmarried girls, perhaps due to the growing influence of the cult of the Virgin which was strengthened by the decision of the Fifth Ecumenical Council of Constantinople in 553 to accord Mary the title *Aeiparthenos* (Ever-Virgin) and by the Marian devotion of influential women, for example the empress Sophia in the late 6th century. Yet this religious commitment was itself characterized as a form of marriage; just as the virgins of early Greece who met an early death wed Hades, so Christian virgins who chose celibacy over marriage wed Christ (Jerome, *Letter*, 22. 25).

While religious celibacy provided an alternative to marriage for a few, the Church continued to consider marriage and children the proper role for most men and women. Greek Orthodoxy maintains this tradition of honouring marriage (to the extent of allowing married clergy), regarding it as a state of grace conferred in the sacrament of Holy Matrimony. There are two steps in the Orthodox marriage service, once held separately but now successively. The Office of Betrothal, which recalls the *engue* of classical Athens, comprises the blessing and an exchange of rings signifying the mutual consent of bride and groom, a notable change from the ancient past when the consent of the bride was irrelevant. In the Office of Crowning the couple are crowned with leaves and flowers after which they drink wine from the same chalice in homage to the wedding feast at Cana, symbolizing their shared future life. While marriage is regarded by the Church as a life commitment, Orthodox canon law allows second and third marriages (although not a fourth).

Marriage and the family have retained their central role in Hellenic society and several continuities bridge past and present. Arranged marriages (*proxenia*) together with premarital dowry negotiations were common until very recently, especially in rural Greece, while the proportion of children born within marriage is the highest within the European Union. Yet there have been changes: according to the Athenian Constitution (article 4, para. 2, 1975), Greek men and women now have the same obligations in life, while the Family Law Act (1983) not only abolished dowry and insisted that family matters should be decided jointly by husband and wife, but also declared that a woman no longer has to change her surname when she marries.

Martyrdom

The Christian concept of martyrdom is derived from two sources: first, as witness to Christ's death and resurrection and thence to the truth of the Christian faith even to death; and secondly, from a belief in the honour of dying for a noble cause, which Christians shared with pagans and Jews in the Greek east.

Neither pagans nor Jews use the term "martyr" (which means "witness"). Both, however, record heroic deaths in causes which they believed to be righteous. Pagan heroism is represented best in the *Acta Alexandrinorum*. There was glory to be won in dying for one's native city, Alexandria (Heliodorus to the gymnasiarch Appian in *Acta Appiani*), as well as in the example of Socrates as he faced death, and other philosophers like him, such as those executed in the reign of Domitian (81–96). In Judaism from the 2nd century BC onwards Jews looked back on the history of their people as one of righteous suffering from the time of Abel to their own day (cf. 4 Maccabees 18. 11–18). As Josephus wrote *c.*AD 95 (*Contra Apionem*, 1. 8), "For it becomes natural to all Jews immediately and from their very birth to esteem those books [of the Law] above all else to contain divine precepts, and to persist in them and if necessary die for them." Such thinking influenced Christians of the first three centuries profoundly. Blandina, the heroine of the martyrs of Lyons in 177, is compared directly to the heroic mother of the Maccabean martyrs from 2 Maccabees, and on the eve of the Great Persecution major churches in north Africa, such as Tigisis, included the books of the Maccabees in their libraries, and these were read and quoted (Secundus of Tigisis in 303 citing Eleazer as an example of courage from 2 Maccabees 6. 21–28, recorded by Augustine, *Brevis Collocatio cum Donatistis*, 3. 13. 25). The effect of the example of the Maccabees on the Christian concept of martyrdom cannot be overestimated.

The first occurrence of the term "martyr", however, is strictly as a witness to Christ's resurrection, and regarded as an essential qualification for admittance to the Twelve (Acts 1: 21–22). It was not long before witness involved danger of death, as Peter experienced when he was brought before the Sanhedrin (Acts 5: 32–33). A little later, Stephen, who had a vision of the Son of Man standing at the right hand of God before he was stoned (Acts 7: 56) was regarded by the martyrs of Lyons in 177 as "the perfect martyr" (Eusebius, *Historiae Ecclesiastica*, 5. 2. 5). By the time the Book of Revelation was compiled (*c.*AD 90), death on account of witness to the faith was being identified with "martyrdom" (Revelation 6:9–10). The souls "of them that were slain for the word of God and for the witness that they gave, lay beneath the altar". This provided the biblical justification for placing bones of martyrs or relics beneath church altars, particularly in Donatist north Africa.

The violent but sporadic persecutions of Christians during the 2nd century produced martyrs and also refined the concept of martyrdom. To be a Christian was now a crime for which punishment was death, though more often than not the authorities were more anxious to secure recantation and due acknowledgement of the Roman gods than to execute the recalcitrant. Though Ignatius of Antioch does not use the word "martyr" in 107, by 160 death during a persecution was regarded as martyrdom (Eusebius, 4. 23. 2). The account of the martyrdom of Polycarp of Smyrna (either in 156 or 166/67) combines refusal to give the slightest credence to the Genius of Caesar or other pagan deities (following the tradition of the Maccabees) with witness to the death on behalf of the teaching of Christianity and loyalty to its founder (Eusebius, 4. 15. 18–24). At the time of the persecution of the Christians of Lyons in 177, the accolade of martyrdom was being accorded to those who on arrest simply confessed their faith. This annoyed the confessors who survived. They reminded their hearers that martyrs "were those who had already passed away", and that only Christ was the "faithful and true martyr and first-born of the dead and author of the life with God". Despite their bravery and willing sacrifice they remained "humble confessors" (Eusebius, 5. 2. 2–3.).

For many Christians, however, at this period desire for martyrdom and its reward of heavenly salvation in glory was irresistible. Writing *c.*178 Celsus, the anti-Christian Platonist, described how some Christians "deliberately rush forward to arouse the wrath of an emperor or governor which brings upon us [i.e. the Christians] blows and tortures and even death" (Origen, *Contra Celsum*, 8. 65). Shortly afterwards, Christians in the province of Asia appeared before the proconsul and demanded to be put to death. They were told they had halters or precipices if that was what they wanted (Tertullian, *Ad Scapulam*, 5). Orthodox churchmen would refuse the title of martyr to such, whom they deemed exhibitionists (Polycarp, in *Martyrium Polycarpi*, 4. 1 and Clement of Alexandria, *Stromata*, 4. 17. 1, and for the early 4th century, Canon 60 of the Council of Elvira). Meanwhile, the Montanists of Phrygia continued the tradition of prophetic religion, leading to a climax in martyrdom (Eusebius, 5. 18. 5, 11).

The first officially sponsored and universal persecution under Decius in 250 resulted in both types of martyrdom. While the great majority of Christians appear to have obeyed the emperor's call to perform sacrifice for the safety of the empire in face of the Gothic invasions, some refused and went to their deaths. The account of the martyrdom of the presbyter Pionius from near Smyrna gives a graphic contemporary account of a Christian for whom arrest and death were everything. He was accompanied to martyrdom by a Marcionite dissident whose church also accepted martyrdom as in accord with Christ's teaching (*Martyrium Pionii*, 21. 5).

The persecution under Valerian in 257–59 explicitly condemned Christian clergy who persisted in their faith, first to exile, and then to death. Dionysius, bishop of Alexandria, was exiled to the oasis of Kephro in 257, but escaped death (Eusebius, 7. 11. 5). He was more fortunate than some of the Christian leaders, especially in the west, notably Cyprian of Carthage (martyred 14 September 258) and Pope Xystus and his four deacons, who were arrested in the catacomb of

Callistus and executed on the spot on 6 August 258 (Cyprian, *Letters*, 80. 1).

Valerian was captured by the Persians near Edessa in June 260. Persecution ended, and for the next 43 years the Church was practically unmolested. It flourished, and when in February 303 Diocletian and Maximian launched a final effort to destroy Christianity, the Church was strong in town and countryside alike in some major Mediterranean provinces. "No martyrs" had been Diocletian's intention (Lactantius, *De Mortibus Persecutorum*, 12) and during that year martyrdoms, except for those who provoked it, were few. "I am a Chistian and I want to die for the name of Christ", Euplus was reported to have shouted at the surprised *corrector* (governor) of Sicily when he interrupted the progress of a meeting held in the latter's office at Catania. He had his wish, but he was exceptional at this stage.

The Fourth Edict of Persecution initiated by Diocletian's Caesar Galerius in the spring of 304 brought about a change of tempo. Now all were commanded to sacrifice. Christians such as Euplus, who were regarded as "enemies of the emperor", were joined by many others. Resistance was strongest among the Copts of Egypt and the north Africans. Eusebius' account of the martyrs of Palestine shows how the Egyptian Christians were the most prominent among those encouraging Christians to witness to their faith regardless of the risk of being sent for hard labour in the mines or of execution. In the last final spasm of persecution under the emperor Maximian (308[-13) in 311–12 Eusebius himself witnessed how Coptic Christians in Upper Egypt volunteered one after another for martyrdom, encouraging each other to face the headsman's axe or condemnation to the flames (8. 9. 4–5).

The triumph of Constantine ended martyrdom and persecution, except for brief flurries under Licinius in 319–24 and under Julian in 362–63. Undoubtedly in the Great Persecution the constancy of the martyrs drew many in the east towards Christianity (see Lactantius, *Divine Institutes*, 5. 23). Previously the effect had been less powerful; the Gallic provincials who had witnessed the deaths of the martyrs of Lyons could only wonder that they could forfeit their lives for the sake of a god that did not rescue them (Eusebius, 5. 1. 60), and Pionius was openly mocked as desperate attempts were made to save him from what the great majority of the provincials thought sheer folly (e.g. *Martyrium Pionii*, 20, 21).

Among the Donatist majority Church in north Africa the theology of martyrdom as the goal of a Christian life persisted through the 4th century (Augustine, *Contra Litteras Petiliani*, 2. 89, 196, written *c.*401). Elsewhere, actuality gave way to epic and commemoration. In the 4th and later centuries Christians looked back to the age of the martyrs as a golden age of Christian heroism that ultimately triumphed and secured the victory of the faith in east and west alike.

Mary, Blessed Virgin

According to the gospels, the Jewish girl Mary, while still a virgin, conceived the child Jesus, whom Christians believe to be the Incarnation of the Son of God. Apart from the infancy narratives of the gospels of Matthew and Luke, Mary makes very few appearances in the gospel narrative, but she is present at the foot of the cross, and after the Resurrection she is mentioned together with the disciples in the upper room, and presumably present with them at the descent of the Holy Spirit at Pentecost. The apocryphal gospels show much less reticence: the so-called *Protevangelium of James* of the late 2nd century, in particular, gives an account of Mary's miraculous birth to her barren parents, Anna and Joachim; her presentation in the Temple, where she was brought up; and her betrothal to Joseph. Ancient legend associates Mary's later years with Ephesus, but according to the later (post 4th-century) accounts of her death (dormition, *koimesis*) she returned to Jerusalem to die, after which her body was assumed into heaven. These legends are important for the later liturgical celebrations of the Mother of God (*Theotokos*, as she is generally known in the Orthodox Church): the Nativity (8 September), the Presentation (25 November), the Meeting of the Lord (2 February; called in the West the Purification), the Annunciation (25 March), and the Dormition (15 August) are all counted among the Twelve Great Feasts of the Orthodox Church.

The dogmatic beliefs of the Byzantine Church about the Blessed Virgin are, however, largely independent of this legendary tradition. They can be summed up in three titles: Mother of God (*Theotokos*, literally: "one who gave birth to

Mary: icon of the Virgin and Child, 14th century, Byzantine Museum, Athens

God"), Ever-Virgin (*Aeiparthenos*), All-Holy (*Panagia*). The conciliar authority for these titles is indirect: they were all ascribed to Mary to safeguard Orthodox doctrine about her Son. The title *Theotokos*, formally defined at the Third Ecumenical Council (Ephesus, 431), is primarily intended to safeguard the doctrine of the true divinity of Christ. The titles *aeiparthenos* (used, and thus endorsed, by the Fifth Ecumenical Council of 553) and *panagia* (implicitly endorsed by the use of the epithet *achrantos*, "without stain", at the Seventh Ecumenical Council of 787) are corollaries of Mary's being *Theotokos*: her continuing virginity and her personal holiness are evidence of the worthiness of her from whom God assumed human nature.

The fact that beliefs about the Mother of God are summed up in titles ascribed to her corresponds closely to the fact that Orthodox Christians express their faith in the Mother of God primarily through devotion to her. Such devotion is very ancient, the earliest prayer to the Mother of God being found on a papyrus dating from the late 3rd or early 4th century: the prayer "Beneath your compassion", in which Mary is addressed by the title *Theotokos*. In succeeding centuries such devotion became all-pervading, taking both private and public forms, and expressed in particular through the veneration of her icons. In an Orthodox church the icon in the iconostasis to the left of the Holy Doors is always an icon of the Mother of God. No Orthodox liturgical service takes place without invocation of the Mother of God: at the end of every litany Mary is invoked as "our all-holy, pure, most blessed and glorious Lady, Mother of God and Ever-Virgin Mary", and most sequences of *troparia* (short hymns) close with a *theotokion*, a brief *troparion* in honour of the Mother of God. The most famous liturgical poem in honour of the Mother of God is the *Akathist* hymn, probably from the 6th century, a kontakion which celebrates the Mother of God under her many titles, with the refrain "Hail [or Rejoice], Bride unwedded!" The imagery in which devotion to the Mother of God finds expression is drawn predominantly from the natural order and from the Old Testament: she is the perfect creature, she is everything that Israel in its expectation of the coming redeemer was meant to be; she is the "joy of all creation" and the "beauty of Jacob". As the one who made possible the Saviour's advent into the world, Mary is closely associated with her son's continuing work of salvation. She is hailed as the "New Eve", whose obedience counteracted the disobedience of the first Eve, and great faith is placed in her intercession and her care or protection (*episkepsis*). Early Byzantine sermons dwell on the power of her intercession and her protection of Christians, especially the people of Constantinople, who ascribed their successful resistance to sieges, especially the series of sieges from 626 to 718, to her care for the city. Invocation of her protection during sieges took the form of processions with her icon round the city walls, accompanied by the singing of litanies and hymns in her honour, especially the *Akathist*. The composition of one of the *prooimia* (introductory hymns) of the *Akathist*, "To thee, Champion and Commander" (*Tei Hypermachoi*), is credibly ascribed to the patriarch Sergios, under whose leadership the city resisted a siege in 626. Many other places in the Byzantine world claimed the protection of the Mother of God, notably the monastic communities located on the Holy Mountain of Athos.

Icons of the Mother of God take many forms. Apart from her appearance in icons of the various liturgical feasts associated with her, the different forms of her icons either celebrate one of her many titles, *Eleousa* ("compassionate"), *Nikopoios* ("victory-maker"), *Platytera* ("wider [than the heavens]"), or are named after the place where the icon was kept, such as Blachernitissa or Zoodochos Pege ("life-giving spring", after the miracle-working spring in Constantinople). Many such icons became the focus of pilgrimage, one of the most famous in the present-day Greek world being that on the island of Tinos.

ANDREW LOUTH

Summary

The gospels tell us little about the life of Mary, the mother of Jesus: she was a virgin at the time of her son's conception (and, in Orthodox and Catholic tradition, ever afterwards), she was present at the Crucifixion, and she was with the disciples after the Resurrection and at Pentecost. The apocryphal gospels provide more information and there are many legends. Her significance for Orthodox Christians may be summarized in her three titles: Mother of God, Ever-Virgin, All-Holy.

Massilia

City in southern France

The city of Massilia (modern Marseilles) was located to the east of the Rhône delta, at the end of a long inlet with its entrance facing the Mediterranean sea, in the territory of a Ligurian tribe, the Segobriges. Its position enabled it to participate in, and control, the trade in precious metals from the eastern coast of Spain and the tin route from Britain. The colony was founded by Phocaeans from Asia Minor *c.*600 BC after they were forced out of their homeland by the Persians. According to Pompeius Trogus, a Gaul of the Vocontii, the foundation legend for the city current in the 1st century BC related that the Greeks sailed up the inlet and there met a tribe of Ligurians led by their king, Nannus. After some negotiation it was agreed that Phocis (or Protis) would marry Gyptis, the daughter of the king, and that the couple would settle down in Ligurian territory.

The site was known to the Greeks before the establishment of a settlement there, since it had previously served as a trading post for both the Rhodians and the Etruscans on their journeys to and from Spain. At first the inhabitants of the new city were oriented towards the sea, engaging in fishing, trading along the Mediterranean coast, and piracy. Their new settlement served as a base for the trade in metals and as a staging post for Greek traders making the journey from their homeland, with stops at the Sicilian cities to the east, or Massilia, before reaching their final destination. Perhaps it was part of a strategy developed in conjunction with the Phocaeans of Rhegium, who controlled the Straits of Messina, to funnel trade along the northern routes in the Mediterranean in the heyday of Ionian commerce in the late 6th and early 5th centuries BC.

Massilia became very prosperous as a result of this trade. A variety of pottery from the early period has been found at the site, indicating far-reaching contacts with the Greek homeland. Massilia itself soon established colonies in Spain and on the Ligurian coast, including Emporium (Ampurias) and Nicaea (Nice). It also founded Alalia on Corsica *c.*565 BC, perhaps to allow the Phocaeans to avoid the trade route along the coast of north Africa controlled by the Phoenicians. As a result, Massilia soon became involved in struggles with Carthage and its Etruscan allies in the western Mediterranean, which continued throughout the 6th and 5th centuries; its new colony on Corsica was abandoned in 540 as a result.

Archaeological evidence from recent excavations presents an interesting sequence of pottery at Massilia. Initially, Ionian, East Greek, and Corinthian ceramics were found on the site. This changes quite suddenly in the second quarter of the 6th century BC when Etruscan wares predominate. Soon after that they decline, and in the middle of the 6th century Attic imports take over, especially flourishing after 530. Earlier prestige gifts present at native inland sites consist of Rhodian bronzes, perhaps carried by an overland route through the Alps from Italy; Athenian pottery is not present. Suddenly in the second half of the 6th century wares from Attica appear in the interior. It seems that Athenian ceramics were passing through Massilia, then being transported upriver to sites in the hinterland. The city had begun to broaden its focus of trade, expanding its interests inland rather than concentrating all its commercial efforts on the sea.

In the second half of the 6th century BC Massilia itself developed a strong pottery industry, producing amphorae to transport local wine. In return for this local beverage and luxury goods from Greece, it received grain, amber, and tin. The growing trade up the Rhône valley influenced both the Hallstatt and La Tène cultures of the Celts. Ligurian and Iberian sites have produced much imported pottery from the late 6th century as well as providing evidence of Greek influence in other areas, such as fortifications, architecture and art, cultivation of the vine and olives, and perhaps even a law code.

Massilia was well known in antiquity for the stability of its oligarchic form of government with its council of 600 (*timouchi*), an additional minor council of 15 members, and three top magistrates, as well as a body of strict Ionian laws transplanted from its homeland (Strabo, 4. 1. 5). Aristotle wrote a work, the *Constitution of Massilia*, now lost, which outlined the structure of its government. Massilia retained the cults of its mother city, such as Artemis of Ephesus, Delphinian Apollo, Cybele, and Leucothea. In addition, it maintained a strong connection with its Greek homeland, as well as advertising the city's prosperity and success, by construction of the Treasury of the Massilians at Delphi. Its wealth is also evident from the attractive series of coins minted in the city.

Prosperity appears to have lessened in the 5th century BC as the result of the expansion of Carthaginian power in the Mediterranean (although this view may be altered by finds from recent excavations in the city), but it continued to develop its own products for export, such as wine and olives. The Hellenization of the hinterland was completed by the second third of the century, but the Phocaean role as a civilizing force lasted until at least the late 5th century.

By the 4th century BC trade once again flourished, particularly after the voyage of Pytheas, a Massilian astronomer and geographer, who sailed through the straits of Gibraltar, exploring the west coast of Africa and circumnavigating Great Britain, drawing on the nautical knowledge and geographical information contained in the 6th-century work, the *Periplous*.

In the Hellenistic period the Massilians sided with Rome against Carthage, increasing their territory with the Romans' help. Massilia and Rome had an early agreement, which later developed into an official alliance. Massilia was a loyal ally, providing information and ships to Rome in the Second Punic War (218–201 BC), and Rome in return allowed the city to maintain its control over the trade route to Spain. In 125, after

aggressive action by local tribes, Massilia appealed to Rome for help, which led to the absorption of the area into the Roman sphere of influence and the formation of the first Gallic province of the Roman empire – Gallia Narbonensis. Little remains of the Greek settlement, the site of which is occupied by the modern city of Marseilles, but there is evidence of a theatre, port facilities, a Hellenistic aqueduct, fortification towers, and a Greek cemetery.

Massilia retained its independence until 49 BC, when it sided with Pompey against Julius Caesar. After Pompey's defeat, Caesar stripped the city of its fleet, and reduced its treasury and territory, but it retained a certain degree of autonomy due to its status as a *civitas foederata*. Its constitution remained in effect until the 1st century AD when it finally lost its independence to the expanding Roman empire. At that time Massilia's commercial and political power also declined, but it remained a centre of Greek culture and learning until the 6th century AD, ending only with the domination of the Franks.

Summary

Massilia (modern Marseilles) was an important commercial power as a result of its role as an intermediary in the trade between the Iberians to the west, the Ligurians and other tribes on the coast, the Celts of the hinterland, and the Greeks of its homeland, not only monopolizing the trade in precious metals but also providing Greek products such as pottery and wine in return for grain and amber. Founded *c.*600 BC, it also played an important role in the Hellenization of Gaul and Spain. It remained a centre of Greek culture in the area until the end of the Roman empire.

Mathematics

Though mathematics is in some way the most typical, and is arguably the most enduring, of the achievements of the ancient Greeks, it was not originally their invention. The Greeks themselves believed that geometry had come to them from Egypt (e.g. Herodotus, 2. 109), and Aristotle (*Metaphysics*, 1. 1. 981b23) explained the origins of mathematics in Egypt by the fact that the Egyptian priests were a leisured class, who had time to spend on intellectual pursuits. It is also now known that the Babylonians had an impressive and ancient system of mathematics (though this is noticed hardly at all by ancient Greek sources). The fact, however, that mathematics (if mathematics is taken to mean techniques for manipulating figures and numbers, and expressing relationships between them) was not original to the Greeks does not detract from their achievement of devising the concept of mathematical proof and developing the idea of the mathematical system which takes as its starting point the simplest axioms possible and proceeds from there by a process of rigorous proof to the demonstration of quite complex propositions. The result was to transform mathematics from a subject which was practically useful (and which also might be quite interesting, but only as a by-product) to a discipline which provided a new (and more demanding) paradigm of knowledge, and could be regarded as culturally and intellectually, rather than practically, important. Indeed, there is a rich tradition of anecdotes decrying those who hoped to get practical advantage from the study of mathematics, exemplified by the story told of Euclid by Proclus, that when one of his pupils asked him what was the use of learning mathematics, he told a slave to give the pupil a small coin "since he must profit by what he learns".

Unfortunately, since the works of Euclid are the earliest complete mathematical treatises which survive, and since extant accounts of the work of earlier mathematicians have probably been restated in Euclidean form, the process by which the distinctive features of Greek mathematics developed remains speculative. Though there is some evidence of early work on arithmetic (or more properly number theory), it is only in geometry that the distinctively Greek axiomatization and systematization of mathematics can be seen to its fullest extent. Though there is a persistent tradition that the Pythagoreans were prominent in the early stages of Greek mathematics (the importance given to mathematics in Pythagorean philosophical system certainly seems to have influenced the direction Greek mathematics took) and despite the prominence of individual Pythagorean mathematicians such as Archytas, in general those to whom the earliest discoveries were credited (Thales of Miletus for example) were not Pythagoreans. The earliest mathematicians did not give proofs as rigorous as those demanded later; at any rate, some of the propositions credited to them can be proved only by means of techniques developed much later. Greek mathematicians often made a distinction between the discoverer of a proposition and the person who produced the proof. Hippocrates of Chios (working in the 2nd half of the 5th century BC) was said to have been the first to produce an *Elements*, a systematic arrangement of geometrical theorems in logical order.

In the 5th and 4th centuries BC geometry developed to the point where it became the kind of mathematics recognizable

today. The tradition as reported in the sources is that at this period geometry was concerned largely with problems about constructing certain figures, three of which became especially famous.

The first, the duplication of the cube, is sometimes referred to as the Delian problem, from the story that it originated when an oracle told the people of Delos that they could avert a plague by doubling the size of Apollo's altar, which was cubical; when the mathematics of this proved beyond them, they consulted Plato, who set it as a problem to his students (the story is certainly apocryphal, since Hippocrates of Chios, well before the date of Plato's activity, had reduced the problem to one of finding two mean proportionals in continued proportion between two lines, one twice the length of the other). A number of attempted solutions of this problem have been preserved, including a remarkable one by the Pythagorean Archytas of Tarentum (early 4th century BC), perhaps the first attempt at three-dimensional geometry, involving the intersection of a cylinder, a right cone, and a torus.

The second problem was the squaring of the circle, that is to say the construction of a square having the same area as a given circle. Since a circle (like other curves) can coincide with a straight line only at certain points, and not over any finite distance, the problem of relating areas bounded by straight lines with those bounded by curves inevitably made it necessary for mathematicians to confront the difficulties of handling infinite divisibility and infinitesimal magnitudes (though Hippocrates of Chios' work on the quadrature of lunes – areas cut off by the intersection of two arcs of circles – which contains the oldest geometrical proof to have survived, may have been an attempt, ultimately unsuccessful, to solve it without involving infinitesimals). An allusion to this problem in Aristophanes' *Birds* (line 1005) suggests that it attracted the interest of a wider public. Antiphon, the Athenian Sophist (5th century BC), is said to have tried to find a solution by inscribing within a circle polygons with more and more sides in the hope that they would eventually coincide with the circle; Aristotle treated this approach with open contempt. In the 4th century Bryson used both inscribed and circumscribed polygons which, if it was not simply a more complex application of Antiphon's fallacious approach, may have been an attempt to arrive at a ratio between the two polygons which would represent the area of the circle; if so, it was an important step towards the solution eventually found by Eudoxus. Later mathematicians approached the problem through the use of higher curves.

The third problem, the trisection of any angle (which probably arose from attempts to construct polygons), was approached by the Sophist Hippias of Elis (5th century BC) through the use of the *quadratrix*, one of the first higher curves, the locus of the intersection of the radius of a circle moving through 90 degrees and a straight line at right angles to the original position of the radius moving from the circumference to the centre of the circle uniformly in the same time; it was also used in a solution to the problem of the squaring of the circle.

Theodorus of Cyrene (late 5th century) did important work on irrational numbers (a problem which was raised initially following the discovery that the relationship between the side and diagonal of a square was the ratio of 1 to the square root of 2, which cannot be expressed by a ratio between any combination of whole numbers), which was developed by his pupil Theaetetus (d. 369 BC) into a general theory of irrationals. At about the same time Eudoxus of Cnidus (first half of the 4th century BC) not only put forward a theory of proportion which would deal with both commensurable and incommensurable magnitudes, but also devised a strategy of proof (usually misleadingly referred to as the "method of exhaustion") which evaded the problem of indivisible magnitudes, and so opened the way to serious work on figures and solids bounded by curves.

The Hellenistic period, building on the work of the 4th century, was the most creative period of Greek mathematics. The geometry of the previous period was summarized and systematized in the first surviving Greek mathematical work, Euclid's *Elements*. Archimedes (d. 212/11 BC), perhaps the greatest of Greek mathematicians, did impressively innovative work on planes and solids bounded by curves, and extended mathematical methods to mechanics and hydrostatics, and Apollonius of Perge (late 3rd or early 2nd century BC) wrote a definitive work on the geometry of the parabola, the hyperbola, and the ellipse (referred to at this period as conic sections).

Though it was only in geometry that the distinctive Greek concept of formal proof was fully developed, other branches of mathematics were not neglected. Diophantus' *Arithmetica* dealt with problems in algebra, through worked examples and without proof, and Hero of Alexandria demonstrated that he could perform various complicated mathematical operations, including solving quadratic equations by a method quite close to the formula still used. Greek astronomers were familiar with some of the most important trigonometrical functions, and Ptolemy produced a table of chords which expresses the same relationships as a modern sine table.

Although there were no significant new developments in Greek mathematics, or in mathematics in general, until the development of algebra by the Arabs, the work of Italians in the later Middle Ages and the Renaissance (building on the achievement of Diophantus), and the invention of calculus in the 17th century, serious mathematical work continued. Pappus, in the 3rd or 4th century AD, composed a series of works, most of which still survive in a compilation called the *Synagoge* or *Collection*, which consists largely of commentary on and expansion of earlier work, with some new material (which may or may not be Pappus' own). It is not only an invaluable source for the history of Greek mathematics, but is also good evidence for the continuing vigour of the subject. From the 3rd to the 5th century AD the Neoplatonic school of philosophy (which stressed the metaphysical significance of mathematics, and the spiritual benefits to be gained from studying it) produced a number of commentaries on mathematical works which, though not original in themselves, preserve a great deal which might otherwise have been lost. In particular, Proclus (AD 412–85) wrote a commentary on the first book of Euclid's *Elements*, whose historical sections draw in part on a lost history of mathematics written by Eudemus in the 4th century BC; further information is contained in Proclus' commentaries on various dialogues of Plato. Later, in the 6th century AD, Eutocius produced a series of commentaries on the major works of Archimedes, revealing evidence of vigorous mathematical activity which would otherwise be lost. At about the same time, Anthemius of Tralles, one of the architects of

Justinian's Hagia Sophia, was a mathematician of some importance. A surviving fragment of one of his works, *On Burning-Mirrors*, reveals that it was not simply a discussion of an optical device, but a serious contribution to the study of conic sections. The importance of mathematics in the educational system in the Byzantine period is evident from a work attributed to Michael Psellos in the 11th century on arithmetic, music, geometry, and astronomy (though the degree of mathematical competence it shows is unimpressive), and a work by George Pachymeres (1242–1310) on the educational syllabus, which draws heavily on Euclid and Diophantus. A curious confirmation of the continuing fascination of the educated classes in the Byzantine period with mathematics is given by Anna Komnene (*Alexiad*, 9. 10) who records that Nikephoros Diogenes, imprisoned and blinded for plotting against the emperor Alexios (1081–1118), consoled himself by taking up the study of geometry, which he achieved by the use of diagrams whose lines were in relief, so that he could feel them with his fingers. During the Byzantine period many Greek mathematical works were translated into Arabic (and some indeed survive only in Arabic) and became the basis of the mathematics of the Islamic world. That the movement of ideas was not simply one way is shown by Planudes's exposition of the system of Arabic (or, as he more properly refers to them, Indian) numerals in the 13th century, and Isaac Argyros' use of Persian material in the 14th century.

Mausolus

Ruler of Caria in the 4th century BC

In 392 BC Hecatomnus, father of Mausolus, was appointed one of several native satraps who ruled Asia Minor (Anatolia) for the Persian king in the early 4th century BC. Hecatomnus' initial assignments for the Great King were to crush Evagoras, rebel ruler of Cyprus, and to secure Caria against an expansionist Sparta, leader of the Greek states after the Peloponnesian War.

Mausolus became satrap *c.*377 BC amid a tangled confusion of Athenian, Spartan, Egyptian, Cyprian, Anatolian, and Persian politics, intrigues, rebellions, and wars. He played an important role in Graeco-Persian politics of his day. In the miscarried revolt of the western satraps (366–359 BC), though himself a rebel, he somehow retained his position and served Persia until his death in 353 BC. In 357–355 BC he supported the Greek rebels in the Social War that ended Athens' Second Confederacy. He at first ruled with his sister (who was also his wife) Artemisia; ruled alone from 353 to 351 BC. The couple had no children. The ancient sources for the career of Mausolus are his contemporaries Isocrates and Demosthenes, as well as Diodorus Siculus, Dionysius of Halicarnassus, and Arrian.

The King's Peace of 387/86 BC, imposed on the Greeks by King Artaxerxes II (404–358 BC), had placed Anatolia officially under the rule of Persia, a status that endured until the conquests of Alexander the Great in 334 BC. But Athens, temporarily disarmed, still sought to thwart Spartan expansion. Hence the Second Athenian League of 377, formed ostensibly for that purpose.

Mausolus' transfer of his capital from inland Mylasa to Halicarnassus soon after his accession was probably a response to this Athenian confederacy. The new capital gave Caria a prominent maritime base, accessible to Greek commercial and cultural influences. Mausolus now built a navy and constructed on the offshore islet of Zephyrion what has been called the first Hellenistic palace.

The revolt of the western satraps had no single cause. Even after Cyrus was defeated in 401 BC, Egypt still defied the Persian power successfully. In 372 BC Datames, satrap of Cappadocia, asserted his independence. Persia's failure immediately to crush him or the Egyptians raised the hopes of other satraps; some hoped to achieve success by forming alliances with Athens or with Sparta.

In 366 BC Mausolus and Autophradates, satrap of Sardis, were sent against Ariobarzanes, another rebellious satrap. Instead, they joined Agesilaus of Sparta (campaigning to undermine the King's Peace) in supporting Ariobarzanes, and Mausolus paid Agesilaus to supply him with mercenaries of his own. It was money that Mausolus had, in fact, collected as tribute on behalf of the king.

More disaffections from Persian rule occurred, peaking in 362 BC. Phrygia, Armenia, Lycia, Ionia, Lydia, Phoenicia, and Syria joined the revolt. Inexorably, by 359 BC, the Persians had reduced this alliance, but Mausolus was among the satraps who retained their status in defeat.

Athens' aggressiveness in an effort to regain old cleruchies created distrust among the members of its alliance and led to the Social War. Mausolus was aware of the resistant mood of Athens' island confederates in the face of what seemed to be Athens' quest for another empire. Indeed, according to Demosthenes in 351 BC, it was Mausolus who had incited Chios, Cos, and Rhodes to rebel and Athens' other allies to full revolt. Though Mausolus' intrigues and participation played a part, Athens had brought it on itself. In 355 BC Isocrates had delivered his speech *On the Peace*, urging the Athenians to dissolve their maritime league, and Athens conceded the independence of Cos, Chios, Rhodes, and Byzantium. Mausolus moved in with Carian garrisons and replaced their democratic governments with oligarchies.

To touch Athens was to be Hellenized. As Athens had long ago attached all of Attica to itself by *synoikismos* (political

amalgamation of settlements), so Mausolus synoecized Halicarnassus, gathering the native communities into a single coastal city. This was his most significant legacy, as his tomb was his most lasting. During his own lifetime Mausolus supervised a design for his Mausoleum, possibly as a monument to the entire Hecatomnid dynasty. (Oddly, the word for it was originally *mnema* or *taphos* – "monument" or "tomb".) It was completed by his wife Artemisia, who was also buried there. The Mausoleum was a triumph of Hellenic architecture and sculpture, or more correctly of the Hellenic spirit. Its decoration was the achievement of the four greatest Greek sculptors of the time: Scopas, Leochares, Bryaxis, and Timotheus. It was designed by the architect Pytheus, who had already designed the Ionic temple of Athena at Priene; he was a revolutionary artist with a new vision of sculptural and architectural harmony.

Even with detailed descriptions of the tomb by Pliny the Elder and Vitruvius, much confusion exists. The Mausoleum, about 50 m tall and with a circumference of 150 m, occupied only a small section on an artificial terrace of 105 by 242 m, surrounded by a wall of white marble. On this podium (really the tomb chamber), whose 160,000 building blocks each weighed about 70 tons, were constructed three columned tiers surmounted by a pyramid of 24 steps, on top of which was Pytheus' colossal four-horse chariot of marble. Great stone lions "protected" the pyramid at its base. Each tier had a sculptural frieze and a group of intercolumnar statues in the round, all manifesting a different theme. The friezes depicted Amazons in battle, centaurs, and chariot races. The themes are common, but the chariot frieze might have depicted the actual games held by Artemisia at Mausolus' funeral. On the lowest tier the statues were life size; above, they were one-and-a-third times life size; and at the top they were one-and-two-thirds life size. The splendid portrait statues of Mausolus and Artemisia still survive. These statues, of the largest size, stood within the great sepulchre and not, as generally believed, in the apex chariot. They are now in the British Museum among the numerous sculptures found by excavators in 1857.

With its new conception of size and space and its colonnades with heroes walking among them, the Mausoleum had great influence over the grandest buildings of the Hellenistic age. Alexander the Great had buried his father in the customary modest Macedonian manner, but after seeing Halicarnassus and the gleaming white tomb of Mausolus in its centre, he built an immense tomb for his friend Hephaestion.

The Mausoleum was still standing in the 12th century. In 1495 the Hospitaller Knights of St John used its stones for their castle (still to be seen in the harbour of modern Bodrum). Today only Mausolus' theatre may be seen; nothing is left of the tomb or palace.

Mausolus' influence is remarkable. He promoted Greek culture – institutions, arts, and language – in southwestern Anatolia. The synoecism of Halicarnassus and the mingling of native Carians and Greek culture were precursors of the Persian–Greek integration credited to Alexander. With his Mausoleum, agora, temples, and theatre, Mausolus bridged the Classical and Hellenistic worlds, as the "last of the satraps and the first of the diadochs".

DANIEL C. SCAVONE

Biography

The son of Hecatomnus, Mausolus was ruler of Caria from 377 to 353 BC together with his sister (also his wife) Artemisia. With the title satrap, he ruled under Persian auspices. But by moving his capital from Mylasa to Halicarnassus he opened it to Greek cultural influences. Having incited Athens' allies to rebel, he annexed Cos, Chios, Rhodes, and Byzantium. He and Artemisia were buried in the monumental Mausoleum, one of the seven wonders of the ancient world.

Mavrokordatos family

The progress of the Mavrokordatos family in public office is inextricably linked with memorable events which had a lasting effect on the state of affairs of the Ottoman empire, of Romania, and of modern Greece. The origins of the family can be traced to the beginning of the 15th century, when members of the Mavro and Cordato families were united by marriage; they had fled Constantinople a few years before its fall and sought refuge in Chios, where they pursued commercial activities.

Alexander, the founder of the dynasty, was born in Constantinople of a Chiot father, Nicholas, whose fortunes were considerably improved by his marriage to Roxandra Scarlatou; she belonged to the Phanariot circle of the capital, composed of surviving members of the Byzantine aristocracy. Towards the middle of the 17th century Alexander was sent to Rome, where he graduated from the Collegio Greco of St Athanasius; subsequently he followed courses in medicine and philosophy at the universities of Bologna and Padua, from which he graduated by submitting a thesis on the circulation of the blood. Upon his return to Constantinople he became director of the patriarchal academy, where he taught medicine and Classical philosophy while taking lessons in oriental languages. In 1673 he was appointed to the post of the Grand Dragoman (chief interpreter) in the Sultan's Divan (council). In this capacity he was instrumental in drawing up the Treaty of Karlowitz in 1699, through which he did not neglect to safeguard the sultan's suzerainty over the Holy Land, thus securing the administration of the holy sites to the Orthodox Christians. The sultan had conferred on him the title of *muharrir esrar*, that is, keeper of secrets, from which is derived his appellation *Ex Aporreton* (Exaporite). He translated into Turkish his treatise on the circulation of the blood, Mercator's *Atlas*, and Blaeu's *Theatrum Mundi*, a cartographic work in 12 volumes. Among his works written in Greek, the *Phrontismata* stand out as an original collection of dicta and moral reflections on the art of governing and good living.

Alexander's son Nicholas (1680–1730), although he was appointed dragoman (interpreter) in 1698, and was the first in the long dynasty of Phanariots to occupy the thrones of Moldavia and Wallachia by becoming *hospodar* (prince) of Moldavia in 1709, was happier in his scholarly activities than in his political functions. He reopened the Academy of Jassy in 1714 and he attracted a number of literati to his court in Bucharest, among whom we may distinguish Antoine Epis, Nicholas Wolff, Stefan Bergler, George Chrysogonos, and Demetrios Prokopiou Pamperis. He corresponded with Chrysanthos Notaras, Jean Le Clerc, the archbishop William Wake, and Johannes Fabricius. He was an accomplished polyglot, with a firm command of several oriental, European, and classical languages. He was the author of *Philotheou Parerga*, now viewed as the first modern Greek novel staged in Constantinople at the time of the Enlightenment, and of a philosophical work, *Peri Kathikonton,* which blends the old Stoic teaching on duties with the sophiological genre of the mirror of princes, the whole recast in the Orthodox patristic tradition.

It seems that this exhortative work found a responsive recipient in the person of Nicholas's son Constantine who, following his studies in Italy, succeeded his father in 1730, and ruled wisely by applying realistic policies in the government of the principalities. Although he occupied the throne intermittently until 1769, his reign was marked by significant reforms which improved the living conditions of the peasants. Serfdom was abolished in his domains a century earlier than in Russia; he founded schools and helped poor children to complete their studies; he alleviated the burden of taxation; and he bestowed on the principalities a minor constitution which he named *Reforma.*

Alexander, the last influential representative of the family, was born in 1791 in Constantinople. After studies in Italy he was employed as secretary by his uncle Ioannis Karadjas, *hospodar* of Wallachia. Soon he was promoted to the presidency of the ministerial cabinet. When his uncle fell from the sultan's favour, he followed him in his escape to Russia and Italy. The English philhellenes met him in Pisa and were at once inspired by the idealistic love of freedom which emanated from his forceful personality. In 1821 Shelley dedicated his drama *Hellas* "to His Excellency Prince Alexander Mavrocordato, late Secretary for foreign affairs to the Hospodar of Wallachia", and two years later Byron, in a letter to John Cam Hobhouse written from Cephalonia, referred to him as "the only civilised person amongst the liberators". In another letter he likened him to Washington and Kosciusko. By that time Alexander had assumed a position of leadership in the War of Independence. He was president of the first Greek national assembly at Epidaurus. Although he was defeated in the battle of Peta, the common-sense diplomacy that he displayed later in Missolonghi and his call to unity to the divided parties of the Greeks earned him the respect of the various warring factions. Nevertheless, his Anglophile stand and his being perceived as a newcomer from abroad did not help in healing the persisting divisions among the army, accentuated by the Russophile party headed by the popular warlord Kolokotronis and the rival Phanariot Dimitrios Ypsilantis. When Greece gained its independence, Alexander was given a minor post in the government of Ioannis Kapodistria, from which he resigned in 1828. He played a more prominent role under King Otho when he was appointed successively minister of finance, and in 1833 premier; in 1834 he was sent as Greek envoy to Munich, Berlin, and London. He became premier again in 1841, and strongly advised Otho on the necessity of constitutional liberties; shortly thereafter he was dispatched to Constantinople as ambassador. He returned to Athens in 1844 and participated in the deliberations for the establishment of the constitution. He was elected the first constitutional prime minister of Greece, but he was toppled by his old rival Kolettis in 1850, and took up the post of ambassador to Paris. Upon his return to Greece in 1853 he withdrew to his magnificent estate in Aegina, where he died in 1865.

This remarkable family exerted lasting influence in the political, legal, and cultural spheres of the countries in which they operated. With their translations of books and the introduction of new ideas from Europe into the Ottoman empire, they precipitated the flowering of the Ottoman renaissance known as the Tulip Era, which spread in a different fashion to Romania and Greece.

Mavromichalis family

Prominent Maniot family

In the last century of Ottoman rule in Greece the strongest, most numerous, and wealthiest of the clans in the Mani (or "Maina") was the Mavromichalis family. Their hereditary stronghold was the fortress of Tsimova (modern Areopolis),

which commanded the only pass through the Taygetus mountains from the Eurotas valley to the port of Gytheion. Theodore Kolokotronis, who had fought alongside the head of the clan, Petrobey Mavromichalis, in the capture of Kalamata in 1821, the first military success against the Ottomans, wrote in his *Memoirs* that the Mavromichali "had poured out much of its blood in the cause of our independence, but it was a family that always had a propensity to commit assassinations".

The Mani, where the Mavromichali established dominance in the course of the 18th century, comprises the last 50 km of the Taygetus range, stretching south to Cape Matapan and, until modern roads were built, outsiders found it virtually inaccessible, which made it a secure refuge against a succession of invaders, whether they were barbarians, the Frankish Villehardouin princes of Achaea, or the Turks. It contained more than a hundred villages with numerous fortified towers of refuge, many of which still survive as mute evidence of feuds among the various leading families, or Nyklians, as they were called locally. The Mavromichali, who according to one tradition had been a Thracian family named Gregorianos that fled from their homeland shortly after the Turks crossed into Europe in 1340, were settled in the Mani certainly by the 16th century and had become the leading Nyklian family before the War of Independence. The Maniots were noted fighters, who claimed descent from the ancient Spartans; their little pirate ships preyed on Turkish and Venetian vessels in the waters south of the Peloponnese, and their interfamily feuds were notorious, though sometimes groups of them would export their skills as warriors by serving as mercenaries in the army of the doge of Venice. But they would unite to repel attacks by the Turks, who in the end left them alone under a Maniot prince designated a "Bey". The first of these, Liberakis Yerakaris, appointed in the middle of the 17th century, proved too enterprising for Ottoman taste and the office lapsed until after the Orloff revolt (1770–74), which the Mani supported. After the revolt collapsed, the Turks revived the office, and the eighth and last of the Beys of the Mani was Petros Mavromichalis, better known as Petrobey.

Petrobey joined the *Philiki Hetaireia* (Friendly Society) in August 1818, evidently under the impression that its leader was Ioannis Kapodistria, who was a secretary of state to the Russian Tsar, Alexander I, and in 1820 he sent an emissary, Kyriakos Kamarinos, to St Petersburg with letters for Kapodistria. The letters have not survived, but we can guess their content from Kapodistria's cautious reply, which granted Petrobey funding for an elementary school in Sparta, but was at pains to deny support for a revolt or any personal connection with the *Philiki Hetaireia*. However, even though Kapodistria distanced himself from the *Philiki Hetaireia*, he did not betray its plans, and on 6 March 1821 the society launched an abortive invasion under Alexander Ypsilantis into Moldavia. Revolt in the Peloponnese began a month later. Petrobey with a following of 2000 Maniots as well as a number of klephts, including two famous ones whom Petrobey was protecting from the Ottoman authorities, Kolokotronis and Anagnostaras, took the field and attacked Kalamata which held a Turkish garrison. It surrendered on 4 April; on the next day 24 priests held a service of thanksgiving for the victory beside the stream that flowed through Kalamata, with 5000 armed men attending, and a few days after this historic celebration Petrobey addressed a declaration to all Christian nations, signed "Petrobey Mavromichalis, Prince and Commander in Chief", in which he proclaimed the determination of the Greeks to free themselves from Ottoman rule and asked all Christendom to aid their fellow Christians.

Petrobey became the nominal commander-in-chief in the Peloponnese, but could exercise little real authority. But he did fight in battle after battle, and, as Kolokotronis noted, the Mavromichali suffered heavy losses: 49 members of the family lost their lives. Petrobey's eldest son, Elias, died in Euboea in 1822: he and his uncle Kyriakules had taken a force of 600 Maniots to lay siege to Carystus, but the Turkish troops were under the command of an energetic officer, Omer Bey, and Elias lost his life in a skirmish. Kyriakules was to die later the same year in a defeat at Splanga in Epirus, and his body was taken to Missolonghi for burial.

When Lord Byron arrived at Cephalonia on his way to Greece in 1823, among the communications from various Greek commanders soliciting his aid was a blunt letter from Petrobey. He wrote that the true way to free Greece was for Byron to lend him £1000 with which he would raise a force of 3000 Spartans and overthrow the Ottomans. In the summer of 1826 Ibrahim Pasha, whose campaign of that year laid waste great areas of the Peloponnese, attempted twice to penetrate the Mani, but on both occasions he was repelled, and Ibrahim lacked the resources to push home an attack. Nonetheless the Mani suffered substantial losses, and Petrobey felt he had a legitimate case for recompense from the Greek government. His demands, however, were rejected by Kapodistria.

Kapodistria, who was elected president for seven years by the National Assembly which met at Troezen on 14 April 1827, aimed at a centralized administration that rode roughshod over Maniot traditions of independence. The Mavromichali had two grievances: one was inadequate compensation for losses in the war, and the other was Kapodistria's claim to collect taxes in the Mani, which the Maniots had never conceded to the Turks. In December 1830 they rebelled. Petrobey was residing in Nauplia, for he was a senator and *proboulos* (chairman) of one of the three sections of the senate (*Panhellenion*), and Kapodistria insisted that he write a firm letter to his people denouncing the uprising. However Petrobey slipped away from Nauplia secretly, hoping to return to the Mani, but in Katakolo he was arrested, brought back to Nauplia, and incarcerated. His son George and his brother Constantine were also brought to Nauplia and put under surveillance. Kapodistria refused any reconciliation; a meeting between himself and Petrobey was arranged for 8 October, but Kapodistria cancelled it, which Petrobey took as a slight to his honour. On Sunday 9 October, as Kapodistria was about to enter the church of St Spyridon in Nauplia for the Liturgy, he was assassinated by George and Constantine. Constantine was mortally wounded by one of Kapodistria's companions whom Kolokotronis identified as a one-armed Cretan, and George was caught, tried, and put to death. In the general anarchy following Kapodistria's death, the Mavromichali tried to make good their claim to collect the taxes in Messenia but their attempts to gain control of the rich Messenian plain were unsuccessful.

The government of the young king Otho scored no military successes in the Mani, but the Maniots made peace with the

royal government, for which the Mavromichali can take some credit. Schools were built, family feuding was suppressed, and local elected government was introduced. The Mani itself was divided between the nomes of Kalamata and Laconia. Petrobey became an honoured member of the government of King Otho, though he was overshadowed by other politicians, and he died a respected statesman in 1848. The Mavromichalis family have remained prominent in Greek politics and, as befits the descendants of the Spartans, royalist sentiment has remained strong in the Mani.

Maximos the Confessor, St 580–662

Monk and theologian

Maximos was probably born in Constantinople, where he was educated. With the accession of Herakleios in 608 he became his *protasecretis* (head of the imperial chancellery), but he resigned after only a few years in this position, and became a monk, first at Chrysopolis, later at Cyzicus. He fled from there in 626, before the advancing Persian army, and by 630 had settled in a Greek-speaking monastery in north Africa, where he was to remain for the next 15 years. In 633 his spiritual mentor Sophronios, soon to become patriarch of Jerusalem, protested vigorously against the imperial policy of Monenergism, the doctrine that in Christ the two divine and human natures were united in a single person and single theandric activity, by which the emperor Herakleios hoped to reconcile the Christians in the eastern part of the empire. Maximos, however, did not come out publicly against such Christological compromise until the promulgation of the *Ekthesis* in 638, which endorsed Monothelitism (the doctrine that Christ had a single will) as imperial orthodoxy. His opposition to this policy led him to Rome, where he seems to have been the inspiration behind the Lateran Council of 649, which condemned both Monenergism and Monothelitism. Pope Martin I and Maximos were both eventually arrested for their opposition to imperial policy. Maximos was tried in Constantinople in 655, condemned, and exiled to Thrace, where attempts were made to break his will. Tried again in 662, he was found guilty of heresy, had his tongue and right hand cut off, and exiled to Lazica, in present-day Georgia, where he died on 13 August. His relics were preserved there, and a local cult developed, but although in the empire the orthodox doctrine of Christ, for which he had given up his life, was vindicated at the Sixth Ecumenical Council in 680–81, no mention was made of either Maximos or Martin I. By the 9th century many of his writings were known and read in Constantinople; Photios, who found him "unclear and difficult to interpret", discusses many of them. In the 11th century Maximos's writings were the favourite reading of Irene, Anna Komnene's mother, to the amazement of her daughter. Maximos was valued by the hesychasts, and more space is devoted to his writings (mostly in select excerpts) than to any other writer in the 18th-century hesychast anthology, the *Philokalia*. He is perhaps the most highly revered of the Fathers among modern Orthodox theologians.

In his writings there is to be found a profound synthesis of the spiritual, dogmatic, and philosophical strands that are interwoven in Byzantine theology. There is, however, nothing systematic about the way that Maximos presents his theology, which is nearly all occasional in form, or put together for the purpose of monastic catechesis. Several works take the monastic form of the century, a collection of 100 paragraphs concerned with ascetical or theological matters, arranged for meditation. The form was popularized (or even invented) by Evagrius, the Origenist theorist of the wisdom of the Desert Fathers, and Maximos's two sets of centuries, *Four Centuries on Love* and *Two Centuries on Theology and the Incarnate Dispensation*, both seem to be conceived as Maximian reworkings and corrections of themes drawn from Evagrius and Origen respectively. Origenism, despite its condemnation at the Fifth Ecumenical Council (553), was still, as is evident from Maximos's writings, a serious problem in Byzantine monasticism, and much of his writing is concerned with countering it. His most famous work, the so-called *Ambigua* ("Difficulties", since they are all concerned with difficult passages in the writings of, almost exclusively, St Gregory of Nazianzus, "the Theologian"), has been called "a refutation of Origenism ... with a full understanding and will to retain what is good in the Alexandrian's doctrine, a refutation perhaps unique in Greek patristic literature" (Sherwood, 1952, p. 3). The *Ambigua*, and his other great work, his *Questions to Thalassius*, both take the form of questions and answers (*erotapokriseis*), the former in reply to questions from a certain Thomas and John, bishop of Cyzicus (the *Ambigua* is really two separate works), and the latter to questions from Thalassius, an abbot in Libya. In the early 640s Maximos was engaged in the Monothelite controversy, and composed many brief works (opuscula) in defence of orthodox doctrine. Despite the informal character of his writings, they express a coherent vision of the created order, ordained for union with God, which was to be articulated and achieved by the human person, created in the image of God, who constitutes the focus and bond of the cosmos. This has been thwarted by human refusal to fulfil the designated role, which entailed cosmic catastrophe and which can be restored only by the Incarnation of the person of God himself. The

Incarnation, revelation, the sacraments, and ascetic struggle are all interlocking parts of the restoration of the original harmony of the cosmos. Maximos's defence of Christological orthodoxy was inspired by his conviction, grounded in this cosmic vision, that in redeeming humanity God would not disregard the integrity of the natural order, something entailed by his assumption of an imperfect human nature, as Monothelitism proposed.

The case of Maximos poses in an acute form the question as to whether Byzantine Orthodoxy is Hellenic or Christian. At his trial he was asked: "Why do you love the Romans and hate the Greeks?" To which Maximos replied, "We have a precept, not to hate anyone: I love the Romans as sharing the same faith, and the Greeks as sharing the same language." Maximos valued his Greek cultural heritage, but it was his faith, which he at that time shared with the pope, for which he was willing to sacrifice his life. One who was perhaps the greatest of Byzantine theologians was bitterly opposed by the theologians of Byzantium, and found his Byzantine identity in faithfulness to the Christian tradition.

Maximos's popularity in modern Orthodox (not least Greek Orthodox) theology is based on his cosmic vision, which is seen to undergird modern ecological concerns, but perhaps even more on the profundity of his metaphysical reflection, especially on the notion of the person.

ANDREW LOUTH

Biography

Born in 580, probably in Constantinople, Maximos was educated there and became *protasecretis* (head of the chancellery) to the emperor Herakleios in 610. But he soon became a monk and by 630 was a member of a monastery in north Africa under the spiritual guidance of Sophronios. He attacked Monothelitism and went to Rome to support Pope Martin I. Accused of treason, he was exiled first in 655 to Thrace and then in 662 to Georgia, where he died the same year.

Maximos the Greek, St *c.*1470–1556

Scholar known as the Enlightener of the Russians

Maximos the Greek, also known as Maximos Vatopedinos and in Russian as Maksim Grek, was an eminent patristic scholar of the 16th century and a highly learned educator and enlightener of Russia. He was born in Arta (Epirus) *c.*1470 into a wealthy family of Laconian origin. His father was Manuel Trivolis, his mother was called Irene, and Maximos' secular name was Michael.

The young Maximos left Arta to complete his studies, initially in Corfu and later in Italy. In the main Renaissance educational centres – Padua, Venice, and Florence (*c.*1492–95) – Maximos made connections with the leading representatives of Italian humanism, Angelo Poliziano, Marsilio Ficino, Aldus Manutius, and Gianfrancesco Pico della Mirandola. A very decisive influence on his thought was the Dominican preacher Girolamo Savonarola (1452–98), so much so that Maximos entered the Dominican order in 1502. Maximos also studied under the distinguished Greeks Janus Laskaris, Laonikos Chalkokondylis, and Constantine Laskaris and was employed as a copyist and corrector in the publishing house of Aldus Manutius.

After leaving Italy and the Dominican order, Maximos returned to Greece around 1506 and went to the monastery of Vatopedi on Mount Athos, which perhaps he chose for its opulent library, to take monastic vows. Because of his intellectual abilities, the monastery of Vatopedi sent him on missions to Macedonia and the Aegean islands. His philological knowledge was complemented on Mount Athos by his intensive occupation with the Church Fathers. In 1516, after ten years as a monk, at the request of the ruler of Russia, Vasiliy III, Maximos was sent to Russia to translate biblical and patristic texts into the Old Church Slavonic language. On his way there, Maximos met the patriarch in Constantinople and heard of the latter's plans for Russia.

Russian sources do not explain clearly why Maximos was sent to Russia, though they state that he went there to seek contributions for his monastery. This is endorsed by his subsequent adversary, Bishop Daniil, who said that Maximos went "to beg for alms", because he asked Vasiliy not to forget the penury of the Holy Monastery of Vatopedi. Moreover, the abbot of Vatopedi, Anthimos, writing to bishop Varlaam, expressed the hope that because of the services offered by Maximos the subsidies of the Great Ruler would increase. Notwithstanding the confusion caused by the accusations of Bishop Daniil, it is certain that Maximos's move to and stay in Russia were at the written request of Vasiliy, who asked for a translator of books.

Maximos departed from Athos, accompanied by the Greek monk Neophytos and the Bulgarian monk Lavrentii. He

arrived in Moscow in 1518 and was received with honour by Vasiliy and bishop Varlaam. He immediately started translating the Psalter with the help of the Russians Dmitri Gerasimov and Vlasii. The whole project was complex, since Maximos had to translate from Greek into Latin and then his colleagues translated into Old Church Slavonic. This procedure, which was followed for other books too, understandably led to some mistakes in translation, for which Maximos later paid a high price. After all, the translation of the Psalter was directed against the special interpretation of the book by the sect of the Judaizers and was deemed very important.

Illiteracy was prevalent in Russia at the time. As prince Andreas Rourbski, a student of Maximos and a first-rate scholar of the 16th century, wrote, Russians languished from spiritual hunger. Ritualism, Pharisaism in religious worship, combined with occultism and astrology, also flourished. Against this backdrop Maximos with great devotion continued to translate various biblical and patristic books as well as to correct the liturgical books, which were full of errors. Thus he strove to educate the Russians by writing and preaching. In a publication of Maximos's works in Old Church Slavonic by the Academy of Razan in 1859, it is written that "in a difficult period, this eminent scholar came from Greece. Orthodox Greece through him offered help in time of need for our Church ... He followed carefully everything that happened at the time and gave his opinion on every special event in his sagacious speeches. He protected the Russian Church from the claims of the Church of Rome. He wrote against the rationalistic teachings of the Reformation, against the Jews, the pagans and the Muslims."

Yet several of his contemporaries could not appreciate his merits, despite the fact that Maximos now commanded great authority in Russia and had obtained imperial patronage. Aside from the difficulties with the translation work, Maximos attempted a new interpretation of the *Nomokanon* and praised the cenobitic style of Athonite monasticism, while criticizing Russian monasteries for their landholdings and the Church for the accumulation of wealth. This criticism of the lifestyle of the Russian clergy caused rancour among a group of clerics and monks, under the leadership of bishop Daniil of Moscow, a student of the influential monk Joseph of Volokolamsk. Maximos had also openly supported the group of "non-possessor" monks under Vassian Patrikeev. Bishop Daniil then deliberately asked Maximos to translate Theodoret's *Religious History*, which favoured Daniil's convictions about monastic property. Since this book also contained epistles by various heretic leaders, Maximos did not accept the assignment, a fact which increased Daniil's antipathy. Furthermore, Maximos objected to the divorce and second marriage of the ruler, for which he was accused of collaborating with the ruler's enemies, the boyars. All these things earned him considerable enmity in princely and ecclesiastical circles alike.

It is no wonder then that Maximos was denounced as a heretic (for changes to the liturgical books) and a danger to the security of the country (for alleged secret contacts with the Turks). A synod in 1525 voted to excommunicate Maximos and to confine him for life in the monastery of Volokolamsk. His protests at this unjust punishment led Daniil to call a second synod in 1531. A further charge was added, that of the reproof of the Russian Church for the unlawful cessation of relations with the patriarchal see of Constantinople. The charges also included the practice of sorcery, the criticism of the Great Ruler, and the attacks on ecclesiastical and monastic property. Maximos was once more condemned to life imprisonment, this time in Tver', and to life privation of Holy Communion. Some of these accusations (including that of sorcery) were certainly unfounded, but others (such as citing the illegal status of the Russian Church) were valid, at least from a Russian perspective. In the 1530s Maximos' imprisonment became more relaxed and he was given the right to read and write. In 1545 the patriarchs of Constantinople and Alexandria asked tsar Ivan IV for his release, but without success. In 1548 his excommunication and imprisonment were annulled, and Maximos moved to the Zagorsk monastery, where he wrote and taught until his death in 1556.

Only posthumously were Maximos's personality and contributions acknowledged officially. About 100 years after his death patriarch Nikon agreed to his canonization, which was authorized by the patriarchates of both Moscow and Constantinople in 1988. Maximos's legacy of literary and theological works was considerable and significant. He wrote about 365 books, of which 163 remain unpublished. Though controversial in his time, he was the most famous and influential scholar in Russia through his work on Byzantine patristic literature, his polemics against western Scholasticism and Lutheranism, and his contributions on dogmatic, liturgical, and canonical issues. Finally, Maximos lived in an important transitional period in which the ecclesiastico-political division between Constantinople and Moscow had started to become evident and was to grow more so in the centuries to come.

FR. NEKTARIOS DROSOS

Biography

Born in Arta *c.*1470 to a wealthy family, Maximos (whose secular name was Michael Trivolis) studied in Corfu and then in the main Humanist centres of Renaissance Italy. In 1502 he joined the Dominican order. In 1506 he returned to Greece and became a monk on Mount Athos. At the request of the Russian ruler Vasiliy III he was sent in 1516 to Moscow to translate books into Old Church Slavonic. Denounced as a heretic, Maximos was imprisoned in 1525. He died at the Zagorsk monastery in 1556.

Media

The Greek media have developed in an insecure political environment, which was characterized by a polarization of opinion and the dominance of factionalism. As part of the Greek democratic system, they have never enjoyed a long period of continuous stability in which to develop a free and independent communication culture. According to Nicos Mouzelis's views on the Greek political system and its uncertain ability to guarantee sufficient civil and political rights for its citizens, and Nikiforos Dimandouros's view on traditional and "underdog" culture in Greece, the political institutions and in particular the Greek media have difficulties in identifying and focusing attention on the main problems in order to serve the public interest in Greece.

The Greek media have developed under continuous threat from hostile forces both externally and internally. When democracy and civil society are weak, the military will have a much greater involvement in politics and government than in a more stable political environment. Therefore it was extremely difficult for the Greek media to serve the public interest and to protect such principles as freedom of expression, impartiality, and professionalism (Gantzias and Kamaras, forthcoming).

The Greek media system has changed since the 1980s primarily on account of changes in communication technology, most recently with the emergence of the new digital television channels and the Internet, but also because of pressures from the European Union. As a result the press and broadcasting channels now face new competition from a variety of regional and global media conglomerates (Gantzias and Kamaras, 2000).

The Press

The origins of the Greek press can be traced back to the end of the 18th century in Vienna. The first Greek newspaper, *Ephimeris* (Gazette), was published in Vienna in 1790 and contained foreign news, trade news, classified advertisements, and poetry. In the early years of the 19th century, before the Greek War of Independence of 1821, a number of Greek scholars aimed to establish a channel of communication with the expatriate communities abroad, as well as with the occupied Greek territories. *Ermis o Logios* (Hermes the Scholar) was published by several Greek intellectuals and educators in order to raise the morale of mainland Greeks and to educate them (Mayer, 1957; Karikopoulos, 1984).

On 1 August 1821 in Kalamata *Salpinx Elliniki* (Greek Trumpet) appeared, the first newspaper ever to be published in free Greece; but the first handwritten mainland newspaper was *Pseftofyllada tou Galaxidiou* (Galaxidi Liar), published a few months earlier at Galaxidi in central Greece. The *Ephimeris ton Athinon* (Athens Gazette) was published in 1824, and the *Ephimeris tis Kyverniseos* (Government Gazette) was founded in Nauplia in February 1833 and moved to Athens in 1834. The first opposition newspaper was *Apollon* (Apollo), founded on the island of Hydra in 1831. A few years later, a donation of three printing presses from a philhellene organization in London boosted printing activity on the mainland.

After four centuries of Turkish occupation there was no democratic tradition or government machinery to provide a framework in which political and civil life could develop along with a market economy. In this chaotic and disorganized sociopolitical environment, patron–client relationships flourished as a means of introducing some degree of order and security into the precarious life of the people (Mouzelis 1986, 1995). The press played an important role in the intense competition between the various factions struggling for power and its partisan identification with one group or another was the natural result of political clientelism. The government institutions supported their clients, gaining political power in return for favours; and by protecting particular sections of the press, they maintained their power base.

A series of printing efforts followed the early revolutionary press. By the end of the 19th century 9 more daily newspapers had appeared on the Greek market, and during the first quarter of the 20th century 17 more daily titles were launched; but out of the total of 26 newspapers that were published before 1925, only 5 titles remain in existence today. These are *Estia* (Hearth), first published in 1894, *Rizospastis* (Radical, 1908), *Ethnos* (Nation, 1913), *To Vima* (Tribune, 1922), and *Kathimerini* (Daily, 1922) (Leandros, 1992; Zaharopoulos and Paraschos, 1993).

By the end of the 20th century the publisher-typographer of the revolutionary years had gradually been replaced by the publisher-journalist who was also an entrepreneur. Especially after World War II, new forms of financing emerged, as well as direct and indirect lines of dependence between the press, the state, and entrepreneurial capital (Karikopoulos, 1984). After 1909 the press reflected changes created by the political dominance of the progressive wing associated mainly with Eleftherios Venizelos and the Liberal Party. Newspaper titles such as the *Hronos* (Time, 1903–39), the *Patris* (Homeland, 1905–35), *Esperini* (Afternoon, 1903–35), *Ethnos* (Nation, 1913–70; relaunched 1981), *Kathimerini* (Daily, 1919), *Vradini* (Evening, 1923), and *Eleftheron Vima* (Free Tribune, 1922) played an important role in recording, and occasionally

participating in, the political developments in Greece during the first half of the 20th century. In the early decades of the century, press circulation increased. In 1915 the total circulation of the Athens daily press was estimated to be around 150,000 copies and in the period 1930–36 circulation reached an average of 350,000–360,000.

A constitution drafted by R. Fereos in the revolutionary years called for "unlimited freedom of publishing" (Article 122). The Epidaurus Constitution (1822) and the Declaration of Independence, as well as in the Astros Constitution (Epidaurus Law, 1823), state that all Greeks have the right to publish their views via the press providing that they do not attack Christianity or established ethical principles, and they abstain from personal insults.

In the Trizina Constitution (1827) freedom of the press was reinforced with the declaration that the right to publicize opinions in writing and to publish in the press would not be subject to censorship. Later, in the Constitution of 1832, more details were included, such as the right of all citizens to become publishers if properly educated and to be held responsible for any material they published. In the Constitution of 1844 censorship was clearly prohibited as well as any other preventative measures against publishing. In the Constitution of 1911 confiscation of newspapers or any other printed intellectual material was forbidden, except in extreme cases of insults against Christianity, common decency, and the king.

Freedom of expression and of the press was included in various constitutional acts: 1823 (Epidaurus Law), 1827 (Trizina Political Constitution), 1844 Constitution, 1848, and 1864; in 1911 press freedom was specifically stated as an individual right (article 14). Later, the freedom of the press was heavily tested during the Balkan Wars, World War I, the Asia Minor campaign, and the disaster that followed. Article 14 (declaring freedom of the press) was stressed in the Constitution of 1927 and a new law on the press (Law 5060/1931) was put into effect. The Constitution of 1925 introduced the prosecution of press offences (although they were not characterized as a serious crime), a clause that was reversed in the Constitution of 1952.

The restoration of democracy and a series of measures aimed at the protection of the new polity in the mid-1930s led to the cancellation of press freedom in August 1936. During the Metaxas dictatorship the press was fostered and guided by the regime. A series of laws ruled against press freedom, referring to such issues as trade unionism, newspaper finances, etc. The most important law was the Obligatory Law 1092/1938, a serious blow to press freedom. A "secret" press emerged that became an outlaw press during the Nazi occupation.

In the period 1941–44, when Greece was under Nazi occupation, the newspapers that initially maintained their circulation remained, until their final closure, passively critical of the German-Italian military, refusing to print propaganda articles, and contributing to the general resistance movement against the occupying forces. More than 100 papers were published during the occupation, such as *Krypho Scholeio* (Secret School, 1943–44), *Elliniki Foni* (Greek Voice, 1943–44), *Machomeni Hellas* (Fighting Greece, 1942–44), *Machi* (Battle, 1942–44), *Hellinon Aima* (Greek Blood, 1942–45), and many others (Mayer, 1957, Paraschos, 1995).

The press was also targeted by the Papagos government which passed Law 2493/1953 referring to offences committed through publications in the press, creating havoc in journalistic circles, and forcing the Athens press to protest by stopping its presses in July 1953. By the end of the 1950s the daily political newspaper market consisted of 13 titles: 6 morning and 7 afternoon.

During the years of the military junta (1967–74) a substantial number of newspapers ceased operations, either because they were severely censored and finally closed down by the regime, or of their own accord as a response to the coup d'état. Out of 14 daily newspapers in circulation on 21 April 1967, only 9 remained open in 1974. *Kathimerini* and *Mesimvrini*, with a daily average of 130,000 copies between them, stopped their presses in protest against the colonels (Vlachou, 1992). Also *Eleftheria* (Freedom) as well as the left *Avgi* (Dawn) and *Dimokratiki Allagi* (Democratic Change) were banned by the regime in the early days of the junta. Over a two-month period (April–May), the total average daily circulation decreased by 36.2 per cent.

During the dictatorship press censorship ranged from the full subordination of newspapers in the early months of military rule to relative relaxation in the years 1969–71. The regime had seen the role of the press as an essential state mechanism, whose primary job was to disseminate established views, support the administration, and contribute to the formation of public opinion (Stratos, 1995; Zaharopoulos and Paraschos, 1993).

In the Constitution of 1968 freedom of the press was included in principle, although certain inserted clauses reflected the dictatorship's views on the issue. Article 14 was encumbered with so many provisions that it appeared almost impossible for the press to publish any opposition views. These restrictions remained in the Constitution of 1973, and were eventually abolished in the Constitution of 1975 with the restoration of democracy.

After the restoration of democracy on 26 July 1974, the circulation of the daily press increased by 61.3 per cent between June and August, reaching the peak of the decade with an average of 1,128,000 copies, recorded in August 1974. The abolition of all restrictions on the press, which led to the relaunch of newspapers previously banned by the regime, as well as the public's thirst for freedom of information and unrestricted expression of personal and political beliefs, were the main reasons for the increase in circulation. However, this rapid increase in circulation did not last long. One year later, in 1975, circulation started to decline. Five years later, in 1980, the total circulation had descended to the level almost of the junta period, with the morning press suffering the greater losses. Government laws and regulations had captured the "market" by placing a number of heavy constraints on its future development. The Greek newspapers have not developed in a media market such as that which operates in Western European countries. Many forces, both external (Turks and Balkans) and internal (civil war and dictatorship), have combined in various ways to constrain the "free" spirit of the press.

Some of the factors that have influenced the media system in Greece, such as technological change and new style of ownership during the 1980s, have transformed the Greek press

into a commercial enterprise. In 1989 the new private broadcasting channels, which introduced a competitive element into the monopolistic broadcasting market, indirectly affected the existing newspaper market. Businessmen from all sectors of the economy, such as construction, manufacturing, oil, and shipping, were entering the broadcasting channels and the press market, replacing many of the traditional newspaper proprietors (Gantzias and Kamaras, 2000).

The new commercial publishers were willing to invest heavily in the media market to gain access to publicity. Although the dominant publishers tried hard to launch new newspaper titles during the 1980s, 17 out of 23 new national newspaper titles were forced to close down within two years because of the constraint of the established press market. Moreover, the press in Greece suffers from low circulation and too many medium-size publications. In the 1980s technological developments changed the traditional newspaper production process. The replacement of linotype printing machines with the modern practice of phototypesetting was a major breakthrough for Greek newspapers, and desktop publishing and the use of computers in general have contributed to the emergence of a new era for the printing industry. Generally, technological improvements have allowed most newspapers to modernize their appearance and to become more efficient in news gathering and processing. The results of technology and the use of computing in printed media were evident in the areas of printing techniques, layout, and the extensive use of colour.

The nine-year period 1981–89, during which the country was ruled by successive PASOK governments, was a golden age for the Athens daily political press. Daily circulation remained constantly at a level of 900,000 to 1 million copies, with even higher figures being achieved in pre-election periods. In 1994 new press legislation (Law 2243/1994), put forward by a PASOK administration, abolished the Metaxas law and contributed to the modernization and systematic codification of press legislation. In the 1990s a series of initiatives to launch new titles materialized, some of which were unsuccessful. On the other hand, the periodical press, such as life-style magazines and specialized journals, was strengthened. The increased demand for specialized titles relating to the economy, business, and financial activity was a result of the further evolution and maturity of the Greek economy, which was associated with the growth of the stock market, the development of modern financial services, and the emergence of a new generation of businessmen who invested heavily in public relations and publicity.

Moreover, the decline in circulation during the 1990s created a high level of insecurity in the press marketplace. For example, the total average circulation of 840,800 copies in 1990 fell to 470,000 in 1998, and the evening press fell from 767,200 copies sold in 1990 to 407,700 copies in 1998. Before 1980 the Greek press had been supported financially by different political parties and the government, and this was the main reason for the problems it experienced when floated in a competitive media market in the 1990s. The broadcasting monopoly and the diversity of interests in the publishing sector had created a very "cosy" environment in the Greek media market. In the late 1990s the press was challenged by the Internet and by the emergence of a variety of private and digital television channels.

Broadcasting

Both radio and television grew up in non-democratic periods of Greek history: radio under the Metaxas dictatorship (1935–40) and the German occupation during World War II, and television under the junta of 1967–74. The Metaxas dictatorship and later the Nazis during their occupation of Greece used radio as a propaganda tool to disseminate their ideas and to influence public opinion.

The radio and television channels were used by the junta to disseminate its anti-communist propaganda and to influence public opinion. Moreover, the democratic administrations that were formed after 1974 followed the same practice, using state-owned broadcast media for propaganda purposes. The fact that broadcasting emerged in periods when democracy and freedom of speech were suppressed had numerous side-effects on its future development. The radio and television channels were the main avenues for the government of the day to publish its policies during the main news programmes. The broadcasting channels were controlled heavily by the state and by a group of interested parties – the advertisers, the advertising agencies, and the private production sector who were the main programme providers (Paraschos, 1995; Pathanassopoulos, 1989; Dimitras and Doulkeri, 1986; Zaharopoulos and Paraschos, 1993).

In 1981 PASOK gained power and promised the democratization of television, as well as freedom of speech in state broadcasting. Despite this initial aim, the party did not wish to lose control of television, which was seen as an important means of state propaganda and of promoting government policy. Consequently, the Greek broadcasting media remained heavily underdeveloped and state-controlled until 1989, the year when private television was launched. The transition from the stage of underdevelopment to liberalization was very problematic. The rapid and uncontrolled development of private television in the 1990s was characterized by extreme commercialization and a market-driven attitude, not to mention the lack of a coherent policy in frequency allocation, advertising breaks, and broadcasting programmes.

The late introduction of new legislative frameworks (Laws 1866/89 and 2325/95) and the institution of independent authorities (e.g. National Broadcasting Council), which might be expected to act as a regulating mechanism to monitor the broadcasting system and control the private sector, in fact achieved the opposite results. Neither the legislation nor the regulatory body has been very effective in regulating the chaotic broadcasting market (Gantzias and Kamaras, forthcoming; Kiki, 1989; Paraschos, 1995; Venizelos, 1989).

Broadcasting in Greece is in a transitional stage. Analogue television will soon have to control the developments of digital technology. The new law on digital television channels (2644/98) is another piece of legislation that is likely to be very soon out of date when the new digital television channels broadcast their programmes in Greece (Gantzias and Kamaras, 2000). The broadcasting market is seeking its identity, while the government tries to tune the market with digital technology. Insecurity in the broadcasting market together with competition from numerous legal and technically illegal broadcasting stations have created an unsuitable environment for the

development of healthy competition in the analogue media market.

Medicine

The earliest sources of detailed Greek medical knowledge are Homer's *Iliad* and *Odyssey*, both written in the 8th century BC. In the *Iliad* Homer mentions 147 different wounds, for most of which he gives detailed and accurate descriptions. Homer also recorded the medical care given to injured warriors, which focused on providing comfort to the wounded soldier rather than treating the wound itself. Among the warriors some were considered specialists in the art of healing through bandaging and herbal medicine. Two of these specialists were Machaon and Podalirius, who are both described as sons of Asclepius. After Machaon was wounded himself, he was treated by being given a cup of hot wine sprinkled with grated goat cheese and barley. Homer did not discuss any diseases, except for the case of Thersites which contains a typical description of rickets.

An influential development in Greek medicine was the Asclepius cult, which originated in Epidaurus and spread rapidly throughout the 4th century BC. Asclepius, who in the *Iliad* is described only as a skilful physician, was here worshipped as a god of medicine, truth, and prophecy. He was a son of Apollo who had learned the art of healing from the centaur Chiron. The god figure may have been derived from a human Asclepius who is credited with many miracles in healing and lived around 1200 BC.

By the end of the 4th century BC Asclepius was worshipped in about 200 temples, of which those at Epidaurus, Cnidus, Cos, and Pergamum were the most important. The sick would visit the temples for a ritual healing incubation. After purifying themselves through baths, fastings, and sacrifices they slept in a dormitory, or *abaton*, where they were visited in a dream by Asclepius or one of his priests. In the morning the priests would interpret the dream and give advice. Since the priests wanted to ensure that the sick had a chance of recovery, they became skilful in diagnosis. The extent and variety of the temple cures can be seen from the tokens the cured left behind. At the Asclepieion at Epidaurus about 10 cubic m of terracotta replicas of afflicted limbs and organs have been found, illustrating successful case studies. Inscriptions on the temples show that the treatment of diseases consisted of rest, exercise, diet, and magic.

It was not the priests, however, but the Presocratic philosophers, starting with Thales of Miletus (6th century BC), who led the way towards a naturalistic medicine. In the cosmologies of the Presocratics the inner workings of the human body became subject to the very same principles as the outward phenomena. Of special significance is Empedocles of Acragas (*c.*490–*c.*435 BC), founder of the medical school in Sicily, whose four-element cosmology (fire, earth, water, air) anticipated the doctrine of the four bodily fluids or humours: blood, phlegm, choler (or yellow bile), and melancholy (or black bile). Just as the order of the universe depended on a harmony of the four elements, so was one healthy when the four humours were in balance.

The views of Empedocles influenced Hippocrates of Cos (*c.*460–377 BC), who is generally considered the father of medicine. A contemporary of Plato, Hippocrates lived in the golden age of Greek thought and culture. As with many early Greek figures little is known of his life, and the name may refer to several different people. About 70 medical treatises, generally called the Hippocratic corpus, are traditionally attributed to

him, but it is not clear whether he wrote even one of them. The treatises vary greatly in length and style, and it is generally believed that they used to make up the library of a medical school, probably at Cos, which became the most important centre of medical thought and practice in the 4th century BC – a role that was later taken over by Alexandria. Today Hippocrates is best known for the Hippocratic oath, an ethical code that is still upheld, albeit in radically revised versions. According to the original oath, the physician should use medicine solely for the benefit of the patient, abstain from surgery, keep information about the patient confidential, and refrain from asking a fee for teaching others his trade.

The Hippocratic theory built upon the idea of the Presocratic philosophers that man and nature are subject to the same rules and on Empedocles' theory of the four elements. Reliance on the speculative cosmologies of the Presocratic philosophers was crucial to the Hippocratic theory, since physicians could not engage in dissection to familiarize themselves with the inner workings of the human body. Following Empedocles' theory of the four elements, Hippocratic medical practice consisted of restoring the balance of the four humours. To cure a patient one had to make the offending humour escape or balance itself out. The Hippocratic physicians sought to do this primarily through diets, purgation, bloodletting, and draining abscesses.

One interesting element of the Hippocratic corpus, and a clear mark of its scientific character, is that besides successful treatments medical mistakes were also included. This is especially clear in book 5 of the *Epidemics*, which contains case studies of ill-timed purgatives, badly done cauterizations, irritating wound dressings, and others. Some of the Hippocratic methods, such as treating a dislocation of the hip, remained unsurpassed until the 19th century. Part of the corpus, most prominently the *Aphorismi*, was used as a textbook up to the 19th century.

The other two major centres of Greek medicine during this period were Cnidus and Sicily. Two important figures of the school at Cnidus were Euryhon and Ctesias, both contemporaries of Hippocrates. Euryhon made anatomical studies, explained pleurisy as a lung affection, and discovered that haemorrhage can occur from the arteries as well as the veins. He also believed that disease was caused by insufficient evacuation of the faeces. In Sicily Philistion of Locri, who met Plato at Syracuse, did much to diffuse the medical knowledge of the island and to ensure its synthesis with the views at Cnidus and Cos.

Although Aristotle was not a physician himself, his impact on the development of Greek medicine can hardly be overestimated. Born in 384 BC, he was a son of Nicomachus, who was the court physician to Amyntas II, king of Macedon. Aristotle's main contributions concern his development of the scientific method, to which his formal logic added an element of precision, and his work in comparative anatomy and embryology.

After Aristotle the centre of Greek culture shifted to Alexandria, where a famous medical school was established around 330 BC. Important figures of this period were Herophilus and Erasistratus. Both lived during the single brief period in which the ban on human dissection was lifted. This change in attitude towards dissection was due largely to the teachings of Plato and Aristotle on the soul. According to Galen, Herophilus of Chalcedon (*c.*335–*c.*280 BC) was the first to perform public dissections on human cadavers. He distinguished nerves, tendons, and blood vessels, and gave precise accounts of the retina, liver, pancreas, and the genital organs of both sexes. Herophilus followed the Hippocratic method of balancing the four humours through drugs, diet, and exercise, and is believed to have been the first to measure the pulse, and use it to diagnose a fever.

Herophilus' rival at Alexandria, Erasistratus of Chios (*c.*304–*c.*250 BC), is known especially for his studies of the circulatory systems, including the nervous system, since he thought the nerves were hollow tubes filled with fluid. Erasistratus proposed mechanical explanations for many bodily processes, including digestion, and is often considered the founder of physiology. In the 1st century AD Celsus accused both Herophilus and Erasistratus of performing human vivisection, an accusation that was empathically repeated by Tertullian and St Augustine, but for which there is no evidence.

During the first centuries of the Christian era, many Greek physicians moved to Rome. Among them was Pedanius Dioscurides (*fl.* AD 20), a Greek pharmacist and author of *De Materia Medica*, which contained descriptions of about 600 plants with an explanation of their medical uses, and included many scientific illustrations to help identify them. Dioscurides greatly simplified the pharmacopoeia, and his work is the basis of modern pharmacology.

The first eminent Greek physician in Rome was Asclepiades of Bithynia (*fl.*150 BC), who opposed the humoral theory of medicine. Asclepiades drew upon the atomism of Democritus of Abdera (*fl.*420 BC), attributing disease to the contracted or relaxed condition of tiny solid particles he believed made up the body. This explanation became the basis of a school of medicine that extended until well into the 7th century. It largely disregarded the findings of anatomy and physiology and concentrated on therapeutic massages, fresh air, and corrective diet. Soranus of Ephesus (2nd century AD), who followed Asclepiades' atomist approach, also came to Rome. Soranus wrote on childbirth, including the podalic (feet-first) delivery, infant care, women's diseases, and nervous disorders. An opponent of abortion, he devised several methods of contraception.

The most illustrious Greek physician in Rome was no doubt Galen of Pergamum (*c.*AD 130–201). Galen began his career at the Asclepius temple in Pergamum and came to Rome around AD 163. He was a brilliant and prolific writer with great rhetorical skills. About 300 titles are attributed to him, of which about half survive. They cover close on every aspect of the medical theory and practice in his day. For his own views he combined ideas from Plato and Aristotle with the Hippocratic tradition. Like the Hippocratic physicians, Galen believed that health required an equilibrium of the four humours, but unlike the holistic Hippocratics he argued that imbalances can also be confined to particular organs.

For Galen anatomy formed the basis of medical knowledge and he frequently dissected and experimented on animals. Notable are his vivisection experiments, such as tying off the ureters to show the functions of kidney and bladder. Because of a ban on human dissections, his anatomy was based largely on the dissection of mammals, which often led to errors. His description of the uterus, for instance, is largely that of a dog.

Galen saw the body as three connected systems: the brain and nerves are responsible for sensation and thought; the heart and arteries are responsible for life-giving energy; and the liver and veins are responsible for nutrition and growth.

Although observation does play a role in Galen's system, his general tenet was to explain everything in pure theory, to which his rhetorical skills gave the air of being infallible. This led to a strong tendency to dogmatism among his followers. Galen's approach is in this respect almost the opposite of the Hippocratic method, which tried to remain close to the facts and proceeded through a careful description of case studies.

The Byzantine period is often depicted as a time of stagnation and plagiarism, generating little more than compilations of earlier works. Byzantine medicine, however, is a lively mixture of Greek medical theory, magic, and folk medicine, in which old theories were combined with new observations and adapted for a predominantly rural society. Although the dominant Church was on the whole favourable to medicine, it favoured not the secular healing of physicians, but that of praying, fasting, and the laying on of hands. Consequently, it was the priests that were first consulted in cases of illness. Secular medicine was tolerated as an alternative medicine on which true Christians could also rely. A central feature of Byzantine medicine is the emergence of the hospital, in which respect it was far ahead of developments in the West. Between the 4th and the 12th century Christian houses for the poor, or *xenones*, became well-organized and fully staffed hospitals. Often these *xenones*, like John Chrysostom's *nosokomeia* (places to care for the sick), were associated with cities. Initially, the *xenones* were governed by priests, but by the 12th century physicians had obtained full control over the therapeutic and often also the management side of the hospitals.

Several figures deserve special attention. Alexander of Tralles (525–605) wrote on intestinal worms and developed a complex system of drug prescriptions involving no fewer than 495 different pharmaceuticals. He also sanctioned magic, especially when the patient's belief in it aided the cure. Theophilos Protospatharios (*fl.* AD 630) wrote an influential work on uroscopy and a book on excrements, which indicates the continued use of dungs in pharmaceuticals. Paul of Aegina (7th century) wrote extensively on surgery, providing detailed descriptions of more than 120 different operations, including mastectomy and operations for hernia, tumours, and bladder stone.

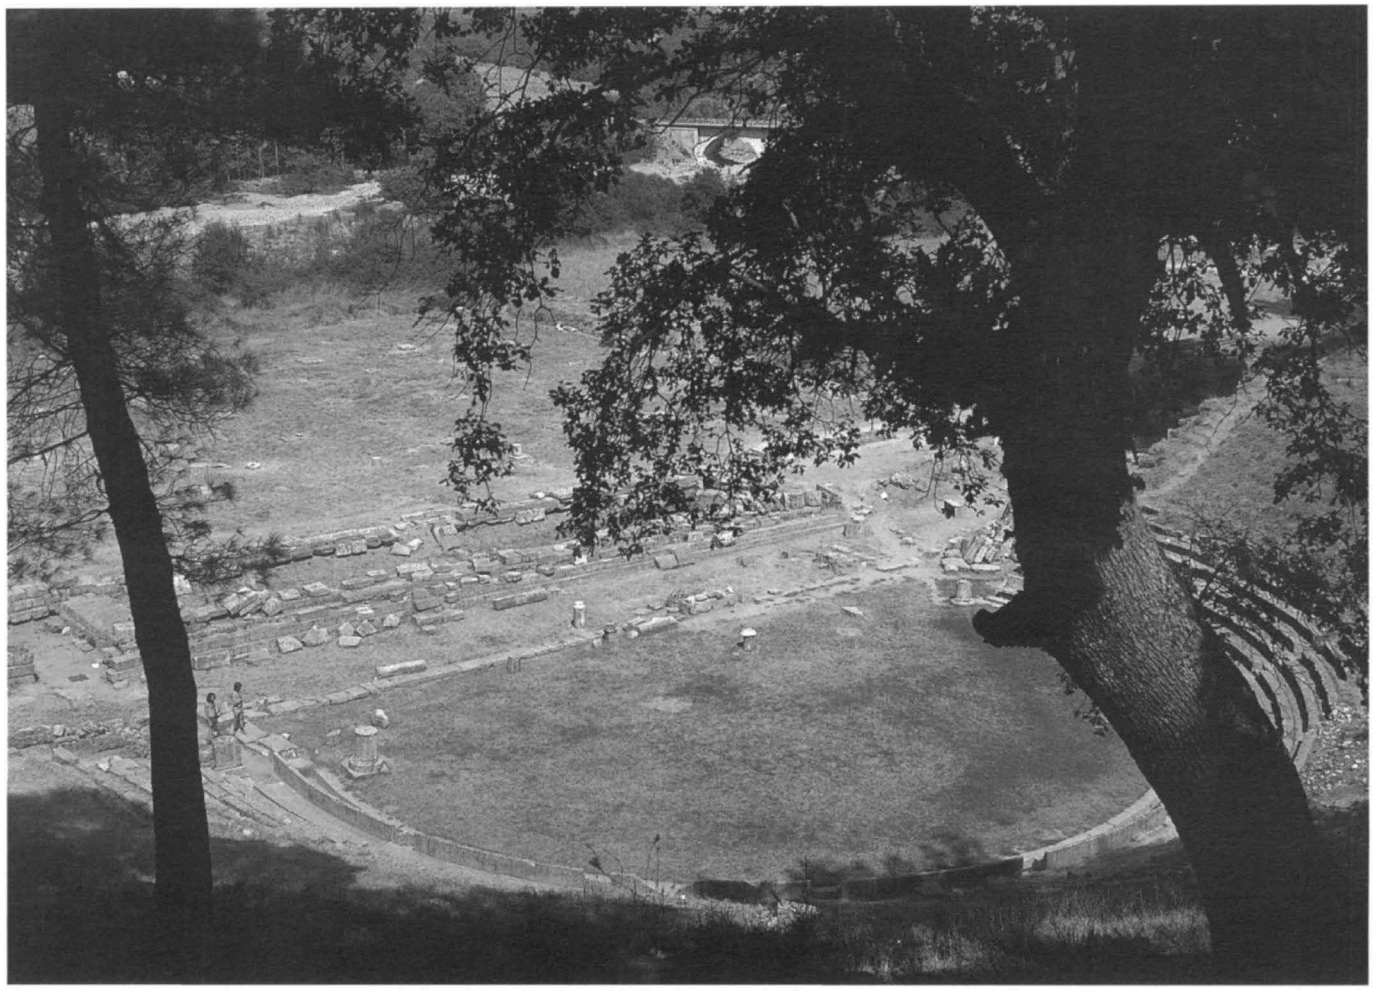
Megalopolis

City in Arcadia

Megalopolis – the ironically named "Great City" – was founded at the instigation of Epaminondas and the Boeotian federation after their shattering victory over the Spartans at the Battle of Leuctra in 371 BC and their subsequent incursion into the Peloponnese during the winter of 370/69, at the invitation of the Arcadian League.

During this incursion Epaminondas had stopped short of attacking the city of Sparta itself, even though it was unwalled, but he successfully removed one of the main supports of Spartan power, their possession of Messenia, reconstituting it as an independent state with a vastly fortified city at Messene. In the next year, 368, he followed this up with a second invasion of the Peloponnese. He used his successes this time to strengthen the Arcadian League. It was at some point during this that he organized the creation of Megalopolis (Pausanias says a few months after Leuctra, when Phrasicleides was archon at Athens, that is in 371/70 BC, but this is too early).

The new city served several purposes. It was situated in southern Arcadia, in an area of upland plain drained by the headwaters of the river Alpheus (which then flows westwards, past Olympia). This area also has access to the Eurotas valley to the southeast, and to Messenia and Mount Ithome to the southwest. It was thus strategically vital if the Spartans were to be restricted to their homeland of Laconia, and an anti-Spartan stronghold here was a crucial part of Epaminondas' new order for the Peloponnese. It was designed also to strengthen the unity of the Arcadian League, to create a formidable single power in the central Peloponnese which would in turn prevent any Spartan resurgence. Arcadia had come rather late to the formation of city-states, and this had made possible the formation of the federal league. Of the existing cities, Mantinea had been formed out of constituent villages, and broken up into villages by the Spartans in 385 BC. Tegea had existed as a recognizable city for centuries, but there was rivalry with the neighbouring Mantineans, who were unlikely to recognize it as the leading state in the Arcadian League. Megalopolis therefore served as a new, artificial, neutral city which all the other Arcadians could recognize as their capital without loss of face. According to Pausanias (2nd century AD), it became the youngest city, not just in Arcadia, but in all Greece, excluding colonies founded by the Romans. He names the founders, probably on the basis of a record kept at Megalopolis itself, as Lycomedes and Hopleas from Mantinea, Timon and Proxenos from Tegea, Creolaos and Acriphios from Cleitor, Eucampidas and Hieronymus from Maenalos, and Possicrates and



Megalopolis: the 4th-century BC theatre seated 21,000, making it one of the largest in Greece

Theoxenos of Parrasia, that is, two from each of the main cities of Arcadia, thus emphasizing its position as a centre for all Arcadians. The actual population came from the existing villages in the vicinity. Pausanias gives a list of their names; he adds that some had to be coerced.

The remains of ancient Megalopolis are not well preserved, and virtually nothing of its surrounding city walls can be seen, though their line has been traced. They enclosed a large area, as at Messene, but from the start the city seems to have been designed for a substantial population, moved in from the villages, unlike Messene whose walls were intended to provide a place of refuge in emergency for Messenians living outside the city. The architectural importance of Megalopolis rests with the buildings constructed to enable it to function as the capital of the Arcadian League: a roofed hall for the council of the league, called the Thersilion after its founder, and the adjacent theatre which, quite apart from any use for the performance of drama, would also have been the seat of the 10,000-strong representative assembly of the league. The porticoed entrance to the Thersilion served as the stage building (*scaenae frons*) of the theatre. Both were excavated by the newly founded British School at Athens as its first major excavation in 1891. The theatre, one of the largest in Greece, was fairly well preserved (though earth tremors have caused subsequent damage). The Thersilion, however, had been reduced to its foundations, perhaps indicating a structure of mud brick; it was already in this state when Pausanias saw it. It was a rectangular building, 66 m wide, 52 m from front (the portico) to back; as with all ancient Greek enclosed buildings of this size its roof had to be supported on a forest of columns, but these were arranged as a series of lines radiating from an area between the centre and the main entrance of the building which was obviously the place from which speakers addressed the council, thus giving direct lines of vision to the speaker from the assembled councillors. Another important building originally excavated by the British School in 1891 (it is now being re-examined by a German archaeological team) was the principal portico building of the agora, the stoa of Philip, a huge Doric building, measuring 155 m in length, with projecting wings at either end. The facade has no fewer than 86 Doric columns; the interior was divided into three aisles by double rows of Ionic columns, with two extra columns in each wing. Such a colossal building could only be the gift of a king; in this case Philip of Macedon, seeking to confirm the support of the Arcadians, and almost certainly Philip II, in the aftermath of Chaeronea and the refusal of the Spartans to join the Peace, rather than Philip V, reviving Megalopolis after it had been sacked by the Spartans under Cleomenes III in 223 BC.

In the Hellenistic period Megalopolis was a firm supporter of Macedon, notably in the 240s when it was ruled by a tyrant,

Lydiades, probably installed with Macedonian assistance. Nevertheless, finding himself increasingly isolated he had joined the Achaean League; it was this that provoked Cleomenes' attack, the effect of which was reversed by the unexpected alliance of the Achaean League with Macedon and the defeat of Cleomenes at the battle of Sellasia in 222 BC. Thereafter Megalopolis continued as a member of the Achaean League, and so became embroiled against Rome in the Third Macedonian War, resulting in the son of its leading politician Lycortas being taken to Rome as a hostage. This was the historian Polybius, whose writings make him not only the greatest historian of the Hellenistic period, and of the involvement of Greece and Rome, but also by far the most eminent citizen of Megalopolis.

After the Roman incorporation of Greece as its province of Achaea, Megalopolis continued without any political importance (and hence the ruin of the Thersilion) as a small provincial city. It faded away in later antiquity, the population dispersing once more into villages. After the War of Independence it was selected, like Sparta and Thebes, as one of the places where a city of Classical Greece was artificially revived, but it was the least successful. Today it remains a small place serving the local lignite mines and the smoke-producing power station.

R.A. TOMLINSON

Summary

Founded after the Battle of Leuctra (371 BC) at the instigation of Epaminondas and the Boeotian Confederacy, Megalopolis was created as the capital of the Arcadian League. The population was drawn from neighbouring villages. It supported Macedon in the Hellenistic period and was a member of the Achaean League. It was the birthplace of Polybius. It declined in the Roman period.

Megara

City in central Greece

Situated between Eleusis (19 km distant) and the isthmus of Corinth (33 km away), close to the north shore of the Saronic Gulf, the ancient city of Megara was topographically focused on the twin acropolises of Alcathous and Caria: the same is true of the modern town.

The ancient harbour, now silted up, was about 1.5 km away at Nisaea, opposite Salamis and to the west of modern Pachi, which is of no importance. On the west side of the site of the Nisaea harbour area is the hill of Palaikastro (later the site of a Frankish fort), which was probably ancient Minoa. Minoa is mentioned in ancient sources as either an island or a cape. To the east, the hill of Hagios Georgios has ancient fortifications and was probably the acropolis of Nisaea.

Although the small plain in which Megara itself lies is fertile and produces vines and olives, the hinterland is mostly mountainous and barren, dominated by the Yerani and Pateras ranges to the west and east respectively.

At its greatest extent the territory of Megara covered the whole of the peninsula between Eleusis and the isthmus, and included Aegosthena and Pagae to the north and east, and Perachora to the west. Pagae, near modern Alepochori, is close to the shore of the easternmost arm of the Corinthian Gulf (the so-called Halcyonic Gulf). Megara's ports thus gave access to two seas. Through its territory passed important land routes between Attica and the isthmus and between central Greece and the isthmus. The position of Megara on these strategic routes, although advantageous to trade and communications, was also the cause of misfortunes since armies ravaged the city in passing or brought it into conflicts through use as a base.

The settlements of Rous (to the north) and Tripodiskos (to the northwest, on Mount Yerani), and the sanctuary of Zeus Aphesios (above Kakia Skala) were also Megarian.

Only limited traces of Neolithic settlement have so far been found (at Lake Vouliagmeni, near Perachora). Finds of potsherds show that the acropolis area of Megara town (where there is also "Cyclopean" walling which may be prehistoric), as well as the probable sites of ancient Nisaea and Minoa, were inhabited in the Bronze Age. Myths suggest that in very early times Megara may have been subject to Athens.

But as a Dorian state it became important only from the 8th century BC. Its situation was favourable for trade and it was active in the colonial movement. Its foundations included Megara Hyblaea and Selinus in Sicily, and Chalcedon and Byzantium on the Bosporus.

Megara was ruled by tyrants for much of the Archaic period. The best known of them is Theagenes (mid-7th century), whose son-in-law Cylon attempted a coup at Athens.

Its territory was diminished in the 6th century when the Athenians, under Solon, took Salamis, and the Corinthians the western part of the peninsula. Megara took part in the Persian Wars.

In 461 the Athenians built the long walls connecting the city with Nisaea and garrisoned both this harbour and that at Pagae. In 456 the Athenians withdrew when the Megarians rejoined the Peloponnesian side. This caused enormous resentment at Athens and resulted in the "Megarian decree" of 432 by which the city was banned from Athenian markets. The Athenians continued to harass the city, building the fort at Boudoron on Salamis to check Nisaea.

After the start of the Peloponnesian War, in which Megara suffered badly, partly because of its changing allegiance, its territory was invaded twice annually. For a time in 424 the Athenians took control of Nisaea and Minoa, but did not succeed in capturing Megara itself.

Recovering in the 4th century, the inhabitants rebuilt the long walls, again with Athenian help, as a defence against Philip of Macedon. In 315 the city was used by Cassander as a base against the Peloponnese. In 307 it was besieged by Demetrius Poliorcetes who took away all the slaves, thus devastating the economic infrastructure. In the 3rd-century

"Chremonid" War (between Athens-Sparta and Macedon) Megara was controlled by the Macedonians, and later (243 BC) the city joined the Achaean League. Pagae and Aegosthena then became independent.

With its territory and power circumscribed, Megara was less important in the Hellenistic and Roman periods. The city suffered at the hands of Roman armies but remained rich in the buildings and works of art described by Pausanias.

In AD 395 Megara suffered a catastrophic destruction at the hands of Alaric's Goths after which its significance was minimal. Nevertheless, although little is known about the history of Megara in the Early Christian and Byzantine periods, it is clear from several surviving churches and monasteries, such as the 12th-century Panagia Kiparissiotissa in the monastery of Hagios Ierotheos, 6 km northwest, and the 12th-century church of Hagia Sotira in the plain to the northeast, that there was considerable activity in the area.

Franks and Ottomans used Megara as a base, the latter for operations in the Peloponnese. The remains of a Frankish fort survive on "Minoa". In the 14th and 15th centuries Albanian settlers arrived in the area, encouraged by the Franks. Various small post-Byzantine churches tell a story of smallscale but continuous occupation up to the 19th century. In 1771 the Megarians supported the commander Mitromaras in the rebellion of Orloff and suffered accordingly. In the early 19th century Ypsilantis used the town as a base for campaigns in Boeotia. In more recent times the Megarian economy has been based on chicken farming and smallscale industry. Today the town is a busy but pleasant backwater.

Study of the town's antiquities began in the 19th century with the work of H. Reinganum and has continued since. Megara's most impressive surviving ancient monument is the so-called Fountain of Theagenes, ascribed to the tyrant. In fact this is a large reservoir, its roof supported by pillars, originally fed by an acqueduct.

Pausanias saw numerous public buildings and works of art. The sites of several of these have been identified by excavations or the discovery of inscriptions. Most of the public buildings either are no longer to be seen (a stoa of the agora, beneath the modern Plateia Metaxa) or have been incorporated in later buildings (inscriptions and a temple of Athena in churches, especially that of the Ypapandi, and houses on Alcathous). Numerous fragments of the fortifications (4th century BC) have been found, allowing the line of the circuit – and some of its gates – to be clearly defined. Megara was known for the quality of its houses, with capacious basements, many examples of which have been excavated.

Famous Megarians included the elegiac poet Theognis (7th or 6th century BC) and Eucleides, founder of the 4th-century BC post-Socratic Megarian school of philosophy.

ROBIN L.N. BARBER

Summary

Megara lies between Athens and Corinth and was often overshadowed by its powerful neighbours. In the 8th century BC it founded colonies in Sicily and on the Bosporus. In the 5th century it suffered as a result of changing allegiances. Refortified in the 4th century, the city was besieged by Demetrius Poliorcetes. In 243 BC it joined the Achaean League. Under the Romans its importance dwindled but it was rich in fine buildings and works of art.

Mehmet II 1432–1481

Ottoman Turkish sultan

Mehmet was born in Edirne (Adrianople) on 30 March 1432, the third son of Sultan Murad II (1421–1451) and his slave concubine Hatun bint Abdullah, whose ethnic origins are obscure and much debated. Entrusted from childhood with token positions of responsibility, he developed early a stubborn, precocious, and contentious personality. The murder of Murad's favourite second son Alaeddin Ali in 1443 prompted the sultan to prepare Mehmet for succession, even though there was little warmth between the arrogant young prince and his moderate, affable father. Amid a mixture of military dangers Murad appointed the 12-year-old Mehmet, if not as full sovereign, then as regent in the European territories while he retired to attend to matters in the Asian regions. The crisis of the resurgent crusade launched in the Balkans by Latin Christian powers was more than young Mehmet and his advisers could manage, and Murad returned to Europe to lead the Turkish forces in their total victory over the crusaders at Varna (10 November 1444).

Murad had devoted his life to mastering what had once been the core territories of old Byzantium, combining much of Asia Minor with the southern Balkans. That control, and the seemingly inevitable conquest of the old Byzantine capital, Constantinople, had been unexpectedly derailed, decades before, by the defeat and capture of Murad's grandfather, Bayazid I (1389–1405), by Tamerlane in 1402. Following a succession struggle, his surviving son, Mehmet I (1413–1421), had reconstituted the Ottoman regime, and Murad had continued that task of restoring and consolidating power. Long years of war had wearied a man of his mild and introspective char-

acter and so, after the victory at Varna, Murad formally abdicated in favour of his son. Young Mehmet's yet undisciplined personality, plus court intrigues, bred opposition and a revolt of the elite Janissary corps in the spring of 1446, which forced Murad to end his retirement and resume control once again. His remaining five years were devoted to renewed warfare against hostile or rebellious elements in the Balkans, in the Byzantine Morea, and in Asia Minor, but leaving to his successor to go beyond preserving the status quo.

Aged 19 at his succession, Mehmet made no dramatic changes at first. He did initiate the practice of the new sultan murdering his surviving brothers as potential rivals. But he retained his father's cautious and conservative advisers. He was, however, clearly in sympathy with more activist counsellors and had identified himself since 1444 with the goal of taking Constantinople, the last barrier to the confirmation of the Ottoman regime's imperial status, and its necessary capital.

Devoting initial efforts to neutralizing all possible distractions from internal or neighbouring forces, Mehmet began steadily marshalling his resources for the stroke on which he staked his power and reputation. He supervised the rapid six-month building of Rumeli Hisari, the mighty fortress on the European side of the Bosporus, as a direct threat to Constantinople. He launched the actual siege on 6 April 1453, and conducted it personally with relentless energy. He had hoped to force the city's surrender, but he pressed recurrent assaults, using siege cannon of unprecedented size. After more than 50 days, when the outcome remained in doubt, he insisted on one final, massive assault on 29 May 1453. Upon its success, Mehmet entered the city in triumphal procession. He deplored the pillaging of the city that he was obliged to allow to his troops, but he endeavoured to control it, claiming public buildings and dedicating Hagia Sophia as a mosque.

His landmark victory had earned him the title of *Fatih* or "the Conqueror" usually fused to his name. Valuing his new prize, he made every effort to repair and restore Constantinople, repopulating it (including Greek elements) and initiating its architectural identity as an Islamic capital. Mehmet was anxious to salvage and incorporate elements of the previous Byzantine order, and he was particularly aware of the value of the Orthodox Church as an agency through which the subject Christian population might be coordinated and ruled. Accordingly, he had the Byzantine patriarchate reconstituted under the able Gennadios II Scholarios, former opponent of Byzantine Church union with the Latin west, with whom he developed a relationship of mutual respect. On the other hand, determined to complete his replacement of the old Byzantine state with the new Ottoman imperial regime, he stamped out the remaining centres of Greek independence. After a preliminary reduction of the Morea (1458) he annexed it fully in 1460, ending the Byzantine principality (despotate) there and renewing its conquest four years later after a brief Venetian seizure. In 1461 he formally ended the feeble regime of the Greek emperors of Trebizond.

Mehmet's three decades of rule continued his and his generals' recurrent campaigns against other Christian powers in the Balkans and against Muslim rivals in the east, as well as intermittent hostilities with Venice. In 1456 he unsuccessfully besieged Belgrade but in 1459 he seized the fortress of Semendria (Smederevo), completing the subjection of Serbia; by 1478 he had reduced Albania. In 1475 he annexed Genoese holdings in the Black Sea regions and established lordship over the Mongol Khanate of the Crimea. In 1480 his forces launched an unsuccessful attack on the Hospitaller Knights of St John in Rhodes, while a daring expeditionary force seized Otranto in a brief attempt to establish a Turkish beachhead in Italy. Only his death brought some respite to Ottoman momentum.

Mehmet's character was complex and sometimes contradictory, a mix of impassioned autocracy and acts of depraved violence combined with open-minded tolerance and enlightened benevolence. With his own diverse ethnic background, he was sensitive to the diverse traditions that constituted his realms and his world – indeed, he was respectful of them and even curious about them. He could display treacherous meanness, as in his brutal murder of Byzantine survivor Loukas Notaras. But he had a lifelong respect for Mara, the Serbian Branković princess who was his stepmother and who, in honoured retirement (outliving him by six years), was always able to intercede with Mehmet. Fascinated by the past, he collected Christian and Byzantine antiquities, assembling them in his new palace complex that we know as Topkapi. He patronized Greek scholarship as well as Islamic, and was inspired by such ancient Greek figures as Achilles and Alexander. Fascinated likewise by new extra-Islamic culture, he cultivated western artists and scholars. To help train artists of his court, he arranged the visit of the great Venetian painter Gentile Bellini, the most notable of several western artists who produced portraits of the conqueror.

Among contemporary Byzantine historians who chronicled the cataclysm of 1453, one of them – the collaborationist official Kritoboulos of Imbros, who won the sultan's favour by negotiating the subjection of Imbros and Lemnos – actually cast his account as a flattering tribute to Mehmet, portraying him as the new Alexander and a true heir to past Byzantine glories.

JOHN W. BARKER

Biography

Born at Edirne in 1432, Mehmet was the third son of Sultan Murad II. After the murder of his second son, Murad began to prepare Mehmet to succeed him, which he duly did in 1451. Successfully taking Constantinople on 29 May 1453, Mehmet assumed the title *Fatih* ("the Conqueror"). He repopulated the city, making it his capital, and established a working relationship with the patriarch Gennadios. He died near Gebze in 1481.

Melas, Pavlos 1870–1904

Officer, guerrilla leader, and Greek national hero

Pavlos Melas was born in 1870 in Marseilles to a wealthy merchant family. In 1876 they moved to Athens, where Michael, Pavlos's father, entered politics and became actively engaged in irredentist societies, such as the *Ethniki Amina* (National Defence) and, later on, the *Ethniki Hetaireia* (National Society), supporting nationalist movements among the unredeemed Greeks of Crete, Epirus, and Macedonia. A multi-ethnic province of the Ottoman empire, Macedonia caused increasing concern, for at that time the Bulgarian national movement was starting to make its presence felt. The Bulgarians had managed in 1870 to break away from the Ecumenical Patriarchate of Constantinople, which was increasingly perceived as a bastion of Greek nationalism, and to establish their own national Church, the Exarchate. The Slav-speaking peasants, the largest ethnic group in Macedonia, were then prompted (with increasingly violent means) to abandon the patriarchate and opt for the Exarchate instead.

Melas, a receptive and accommodating boy, was growing up at a time of successive national upheavals, when the *Megali Idea* (Great Idea), a chimerical dream of uniting all Greeks (or more precisely, all Christians who had some association with "Hellenism" by language, persuasion, or history) within the confines of a Greek state, was the order of the day. The electrifying atmosphere, combined with his upbringing in a family where the intensity of its patriotism was matched only by the volume of its wealth, ensured that Melas was immersed into a romantic brand of nationalism that became the driving force of his short life. In his vivid boyish imagination the klephts of the 1821 revolution were fused with contemporary realities, and blended into a heroic "klephtic" ideal which he perceived at an early stage to be his destiny. This powerful blend profoundly shaped his adult life and ultimately took it.

At the age of 16 he entered the *Stratiotiki Scholi Evelpidon*, the Greek Military Academy, a prestigious (and expensive) school, and therefore a fitting career move for well-bred Athenians. He graduated in 1891 as a second lieutenant in the Artillery, an elite corps. His personal life was to remain virtually inseparable from the nationalist fever that engulfed Greece in the 1890s. In 1892 he married Natalia, daughter of Stephanos Dragoumis, a prominent politician from Macedonia. In Dragoumis's house, a hotbed of irredentist activity, the couple spent much time: Natalia sipping tea with the other women of the house, and Melas, animated and enthusiastic, talking with Dragoumis and his guests about how the Greeks could counter the Bulgarians in Macedonia.

In 1897, the year of the Graeco-Turkish War, the Greeks were plunged into their most humiliating defeat. Melas fervently believed that the time had come for the liberation of Macedonia to become a reality, rather than a debate in smoke-filled drawing rooms. But the battlefield, with which he did not have the direct contact he hoped for despite his emotional plea to join the front line, soon shattered his dreams. After a few days of restlessness, during which he wrote to Natalia that he would see her soon, for "unfortunately" there would be "no opportunity for us to be killed here", Melas joined the pitiful remnants of the Greek army in a "dishonourable, dishonourable, dishonourable" retreat. For him, the shame of 1897 was particularly painful. As the humiliated nation looked for scapegoats and started accusing the *Ethniki Hetaireia*, his father did not find the strength to face the defeat (and its consequences), and died soon afterwards.

A period of depression followed. Back in Athens, Melas continued to be preoccupied (or, rather, possessed) by the future of Macedonia. His only hope was that one day he himself would cross the border with a band, as a true klepht. In early 1904 his wish came true, as four officers (including Melas) were sent on a fact-finding mission in Macedonia. "Today my desire is at last fulfilled", he wrote in February, heading towards the border. Unwavering dedication to his mission, and sheer enjoyment at having at last the opportunity to be (and look like) a klepht sustained him through a difficult and at times disheartening undertaking. By 1904 the Bulgarian movement in Macedonia was already firmly established. Many Christian Slav-speakers, who just called themselves "Christians" whenever they were given the opportunity to do so, started declaring themselves "Bulgarians" under duress from Bulgarian guerrillas, the *comitadjis*. Others, who continued to call themselves "Greeks", meaning in most cases followers of the "Greek" Ecumenical Patriarchate, faced devastating reprisals. In the course of their journey Melas and the other officers visited a number of villages, talked to the peasants, and tried to restore faith in the Greek cause. Soon, however, he was ordered to leave, for the Turks had been informed of his activity. Devastated by the "idiocy by which they separate me from the idea I now work for", he returned heartbroken to Athens. In July 1904, after securing 20 days' leave, he secretly set out on his second journey, which proved even more frustrating and difficult. "I had neither men, nor money, nor contacts", he wrote in moments of despair. But he continued his efforts to form bands from fearful peasants, or from old brigands, and to set up some sort of Greek defence.

However, Melas was temperamentally unsuited for that job. He was at his best in giving enthusiastic speeches to the peasants (of their impact, we shall never know), but he felt unable to participate in the game of terror that the nature of the struggle required. In Macedonia, nationalism (whatever that meant) rested on the barrel of a gun, but he could not pull the trigger. He realized that he had "to kill, to commit murders", but when the opportunity arose, he was left tearful and shaken and the job was delegated to his companions; they showed less remorse. Melas looked like a klepht, but a true one he never was.

In August he returned to Athens, but soon he was back for his third, and last, journey. He just left a note: the "quiet, family life" really suited him best, but a "superior power" pushed him to Macedonia. As it happened, it pushed him to his fate too. With his band he visited many villages in western Macedonia, organizing the Greek defence and talking passionately to local peasants and students of Greek schools. But the Turks were informed of his whereabouts. On 13 October 1904 their detachments reached the village of Statista (now Mela), into which he had moved, and in the ensuing battle he was

shot. He died shortly afterwards in the arms of one of his men. The news shocked the country. The death of a prominent young Athenian under such circumstances, his passionate devotion to his mission, and his remarkable conduct in a field where violence prevailed, ensured that he quickly became the first (and only) national hero of the "Macedonian Struggle" (*Makedonikos Agonas*), the struggle of Greek bands (which started in 1904 and ended four years later) against the *comitadjis*. It is in that that his most important contribution to the Greek cause in Macedonia actually lies.

Melos

Island in the Cyclades

The geographical location of Melos, the most southwesterly of the Cyclades, gave it a position of considerable importance from earliest times, since it was the first of the Aegean islands that mariners would encounter after rounding the southern Peloponnese at Cape Malea on their way to the many ports of the Aegean. The island has an area of 147 sq km and, like a number of other Aegean islands, has volcanic origins, and it is consequently rich in a variety of minerals; the export of these, which include alum, sulphur, keolin, and many others, provided a continuing source of wealth for its inhabitants. The use of millstones produced in Melos was also widespread throughout the Hellenic world. The crater of the volcano that formed the island provides one of the deepest and best-protected harbours in the Aegean. The terrain of Melos is abundant in crops, although its hilly interior has been much mined for its mineral wealth; the highest of its mountains, Prophetis Elias towards the southwest of the island, rises to 751 m.

During the 2nd millennium BC the island formed part of the Cretan and Mycenaean kingdoms, and was later settled by Dorians from Laconia. The Melians provided two penteconters for the Athenians at Salamis (Herodotus, 8. 48), but during the Peloponnesian War they antagonized the Athenians, who mounted a successful siege of the main city, later killing or enslaving the entire population. Thucydides (8. 85–110) provided a record of the dialogue that preceded, and was the ultimate cause of, this event.

From early in the Christian era the prosperity of Melos allowed the island to contribute in several ways to the Hellenic world. Unique in the whole Aegean area is an extensive catacomb at Trypiti where up to 12 galleries were excavated in the soft sandstone. It was probably used from the 3rd to the late 4th centuries AD, and had between 1500 and 2000 Christian burials. Sadly, already by 1843, when the first published account appeared, there had been wholesale robbing of the sarcophagi it contained, and when Theodore Bent visited it in 1884, not a single grave was left unrouched. It was close to this site that the famous statue of Venus, now in the Louvre, was discovered in 1820; it is scarcely an exaggeration to claim that although the statue was mutilated its qualities of idealized perfection of the human figure have since come to represent the Hellenic spirit and its aesthetic message more completely than any other single work of art.

Further evidence of continuing prosperity is the fact that Melos was among the few Aegean islands to send its own bishops to the Sixth and Seventh Church Councils in Constantinople and Nicaea. Attacks by Arab raiders in the later 8th–9th centuries were the probable cause for the abandonment of the island between the later 9th and 12th centuries. The fortunes of Melos after the Fourth Crusade of 1204 and the Deed of Partition followed those of many of the Cyclades, when it came under the control of the Duchy of Naxos from 1206. The proximity of Melos to the Peloponnese, and particularly to Monemvasia, however, meant that with the return of Byzantine rule in Constantinople after 1261 it rejected Latin occupation more readily and actively than any of the other islands. A Greek monk from Monemvasia headed a revolt and drove out the Latins from their castle stronghold. This was to be the last moment until Greek independence that Melos experienced Hellenic rule.

Although the Venetian duke Marco II Sanudo reimposed his rule by force and installed another member of his family, in 1316 the island was raided by the Catalan Company, then establishing themselves in Attica, who carried off some 700 of the inhabitants. In the treaty of 1418 between Venice and the sultan Melos was acknowledged as belonging to Venice, but by 1557 the island had followed the rest of the archipelago into Turkish occupation. Unlike Tinos or Santorini, no outpost of Venetian presence was retained into later centuries. The island was to remain under the Muslim yoke until the coming of Greek independence, developing its own economic and religious life, even for a time supporting a consul who was appointed to assist British interests. There were many changes in the life of the island over these centuries, with Western powers and the Roman Catholic Church always ready to increase their foothold in the Aegean; but Melos was not to play a part that would cause it to stand out from the rest of the islands of the Cyclades.

PAUL HETHERINGTON

Summary

A volcanic island in the southwest Cyclades, Melos was the main source of obsidian in the Bronze Age. Its crater provides one of the

best harbours in the Aegean. The island's inhabitants were massacred or enslaved by the Athenians in 416/15 BC. There are remains of extensive catacombs from the early Christian period.

Men

Hellenic woman is as ubiquitous as Hellenic man, yet across the centuries it is man who has held centre stage in the public domain, and he has consequently more often than his counterpart given rise to civilizations and genealogies, eternal ideas, innovative art, has waged wars, and has been the celebrated object and subject of intimate love and fraternity. While woman is the pillar of domestic life, muse, backstage conspirator, it is man who wears the laurels, wields the sword, runs the races, and heralds the dawn of every great triumph. If Zeus and patrilinealism are to the Greek imagination what Isis and matrilinealism are to the Egyptian, it is the gods who have made it so. Yet human agency has perpetuated the myth.

The patrimony of three thousand years of Hellenic culture is threaded together by a clear distinction between private and public life. With notable exceptions, women determine the former, and men are left with the latter. Family farms and homesteads during the Ottoman empire encouraged these distinctions, as does modern agricultural life, where men are associated with labour and tilling the fields and women with kneading the bread and keeping house, with equal feats of endurance. In some communities, women till as much as they knead. But when women do take centre stage, their dignity is unsurpassable and memorable, for such public presence is culturally unseemly, yet the odds against these occurrences, once great, lessen with each passing decade. In recent years women have gained ever greater entrée into politics, the arts, and higher-degree professions. By and large, men and women are proceeding into the new millennium arm-in-arm. But it is the men in the drama of the Greek experience, ever at the proscenium, we now recollect.

The task of making generalizations about men in the Hellenic world is a formidable one. To circumscribe them in a homogeneous mould would do more damage that it would offer insights, and stereotypes are inevitable. Like any other citizen of the world, the Hellene is complex, enigmatic, and multifarious, yet artistic representation, history, and social constructions do offer some clues. Though the main ports and remote outposts of manhood may be miles apart, we shall try to survey the topography none the less. If there are overarching themes of manhood, manliness, or masculinity within Hellenism, for the most part they are culturally determined.

Yet, reinvent themselves they do, as the romantic hero, the premodern entrepreneur, modern stay-at-home husband, or postmodern poet. One commonality rings true across class, station, and political ideology – most Greek men value their masculinity, which embodies a sextet of attributes: endurance, duty, freedom, love of beauty, passion for knowledge, and love of life. Some value schooling more than others, yet even those with an elementary education will quote Marx, will tell you whence the wind blows in December, will discourse knowledgeably on world politics. Classicism, with or without its nuances, indubitably makes itself known somewhere in the Greek man's mind and sticks. And because of this renowned heritage, real or imagined, a certain amount of braggadocio enters the picture, and for this an audience must be found. Conversation, thus, is the sine qua non of his existence. Without community, comrades, or friends, life's purpose would evade him. An Epicurean fragment: "Remove sight, association, and contact, and the passion of love is at an end."

Men of the Hellenic world communicate not only through speech, but with the eyes and hands. The eyes, possessing inner or outer vision, are the proverbial windows to the soul, and they matter. With radial lines at the outer fringes, knowing much laughter, weathered with experience, they speak volumes. The hands – dirtied by work, the pristine hands of the politician, hands stained by cigarettes, veined, long-nailed, delicate, or strong – greet in kindred manner: firmly. In countenance and comportment variety is the norm. All types factor into the mix – bearded like Dionysus, fresh as Adonis, spectacled, stout, towering, cologned, flat-nosed, cultured, blond, blue-eyed, coffee-skinned, dark, fair, the curly-headed ones, rogue, family man, marauder, pious one, tempestuous, tender. Yet, what matters is truth, not oblivion, and this is conveyed through a steady gaze, universally.

With the birth of Archaic Greek sculptural arts, one witnesses the most lasting memorial to the Hellenic male figure, inherited from the civilization across the sea in Egypt, in the form of the free-standing *kouros*. Strong-limbed and planar in construction, the *kouros* gazes straight ahead and smirks, while one foot steps forward into what will be a continuous unshakeable history, a testimony to his fortitude. Lacking the ease of hip and *contrapposto* fluidity of his later metamorphosis, the static *kouros*-as-museum-piece is very much alive in spirit in contemporary Greece and its diasporas. What it represents is more than an idea. It is an ideal, a perpetual reminder of proportional harmony and stability, against which man measures all things.

What of the world of the homoerotic, the stereotypical love figure adorning those vases one sees in museums in western capitals? Not just a question of sexuality, but a question of beauty. The Alexandrian poet Constantine Cavafy captured the cultural convergences as well as the lure of the sensual in "Of the Jews (AD 50)":

> Painter and poet, runner, discus-thrower,
> beautiful as Endymion: Ianthis, son of Antony.
> From a family on close terms with the Synagogue.
>
> "My most valuable days are those
> when I give up the pursuit of sensuous beauty,
> when I desert the elegant and severe cult of Hellenism,
> with its over-riding devotion
> to perfectly shaped, corruptible white limbs,

and become the man I would want to remain forever:
son of the Jews, the holy Jews."

A most fervent declaration on his part: "...to remain forever
a son of the Jews, the holy Jews."

But he didn't remain anything of the kind.
The Hedonism and Art of Alexandria
kept him as their dedicated son.

Where social relations in ancient Greece delineated sharply between men's work and leisure in the social realm and women's work or play in the private (despite the heady and sporadic appearances of an Aspasia or a Sappho), fraternal and erotic love objects were legendarily men. As much as wives bore the children and stood by their men, the rules governing apprenticeships in philosophy or the arts or the nascent sciences occasionally transcended into elite homoerotic patronages. The elder courting the younger, the younger of perfect body and shapable mind, the elder of knowledge and experience. Plato's idealized Republic made some things clear: the guardians of the city were to be honed and shaped internally and externally. Mathematics, astronomy, musical training, sporting activity, made for the consummate citizen. An advocate of some kind of communism, inclusive of women, sharing the labour and expenditures of a variety of energies in the service of the city, with a wink and a nod in retrospect, one understands none the less the privileged place of men in that structured, hierarchical city.

The Epicureans, however, advanced Plato's invention, acknowledging for the fraternal brotherhood nature's – not god's – roll of the dice. Perambulating through the ether of the planned cosmos are the primordia, first beginnings, random chaotic particles, sensed but not apprehended. How beautiful an idea, random collisions of primordia, just like men, suddenly finding themselves together in commune, eating, drinking, and discussing. In this randomized cosmos, without divine intervention or teleology, how should man live his life? Epicurus' answer: seek pleasure and avoid pain, with temperance. A higher regression from the model city, these Epicurean communards disposed of Aristotle's legendary dictum and lived their lives not solely as political animals but as friends, eschewing public obligations though recognizing the mutual exercise of justice.

The honour-bound heroes of the Trojan War, of conflicts with Sparta, of Alexander's armies, of wars for independence, or wars against fascists, one part reluctant, one part fate-tempting, are long-lasting images of the Hellenic and Hellenic worlds and the Greek nation state. "Dearest, your own great strength will be your death", admonished Homer's Andromache, the loving, white-armed wife of Hector, tragic hero of the Trojan camp, breaker of horses. "Hector, you are father to me, and my honoured mother, you are my brother, and you it is who are my young husband", continued the pre-death eulogy of Andromache, whose name means, "she who fights like a man". To which the adoring husband replied, in Pope's verse:

"Andromache! my soul's far better part,
Why with untimely sorrows heaves thy heart?
No hostile hand can antedate my doom,
Till fate condemns me to the silent tomb."

No man is immortal, not even the hero Achilles, who was dipped into the river Styx for protection against fate, though it was his heel, where he was held, that was to be his downfall. With heroism comes human frailty, not decadent protection. For Homer, man was man, as was the great Alexander of Macedon. Plutarch's character study of him recalls his precocious and determined childhood, his competence, like Hector, to tame a wild horse with gentleness, "a confident voice, and a touch of the heel". Philip, noting his prodigal son's aptitudes, advised, "my son, look for a kingdom equal to yourself, for Macedonia has not space for you." The discontented pioneer, his soldiers haggard, traversed the continents establishing his own outposts of Hellenism, hybridizing his own tribes with those of the east, erstwhile barbarians. Both benevolent and vindictive, Alexander met his death not far from his bath, exhausted. Of these magnificent exploits "the end is always small", wrote the poet Yiorgos Chouliaras.

Homer's high heroic verse resounds archetypically, but from the lyric poets of the 7th and 6th centuries BC to the modern idiomatic poets, poetic subjects remind one of the timelessness of which we are a part. Bawdy like the rest of us, they are cynical, reverent, awesome. This gem from the Byzantine period, a caveat against a careless appearance: "Tall and wavy are the crops/on your hairy face./Scissors?/Never./Throw them away and bring out a plough." Michael Herzfeld's assessment of 20th-century Glendiots is fitting, where he writes "there is less focus of 'being a good man' than on 'being *good* at being a man' – a stance that stresses *performative excellence*." Socially, men do this best in the *kafeneia*, or coffee shops, of the modern day, gesticulating and talking their way to bravadoes.

Ever reveried, again enduring, still politicking, leaving home to find it elsewhere among their own kind, driving taxis, serving tasty morsels, crafting memorials of words and steel, airborne and stubborn, naughtily and forgivingly they persevere and clamour at the gates of hell and paradise. "Try to enjoy the great festival of life with other men", said the Greek Epictetus, enslaved to a Roman master.

Menander 342–292 BC

Comic playwright

Not only was Menander, in the opinion of his Hellenistic followers as well as of modern critics, the greatest playwright of New Comedy, but he is also among the most influential authors in the history of literature. In him the modern attitudes to quotidian existence, human character, life's vicissitudes, and society's conventions were first crystallized. Unconcerned in his works with Sophocles' tragic confrontations with time and the cosmos (though his subtle diction refers often to tragedy), he shows us as we are, with tolerance, affection, and a wisely critical eye. Subsequent writers of drama, when not tragic, usually took his approach for a model, from Shakespeare to Molière to Oscar Wilde.

Menander (or Menandros) was born in Athens of a good family at the end of the Classical period. Among his teachers was Theophrastus, whose *Characters* was surely an influence; Theophrastus' teacher was another realist, Aristotle, and Aristotle, of course, was Plato's student. In 338 BC Philip of Macedon made the Greeks his subjects, and Athens, after a last burst of heroic resistance under Demosthenes, began its slide from Hellas's most energetic city to a provincial town living on its reputation.

Menander's first play, *Orge* (Rage), was produced in 321 BC, and he died, supposedly drowned in the harbour of Piraeus, in 292 BC, a generation after the immense changes in Athenian society wrought by the conquests of Philip's son, Alexander the Great. His work anticipates and then reflects that later world, when men had lost belief in heroism and trust in public religion, and found fulfilment more as private individuals than as active members of the polis. That explains why Menander's plays do not resemble those of the 5th-century BC master of Old Comedy, Aristophanes, but rather the strange late romances of Euripides (who in old age forsook Athens for Macedonia); in plays such as *Alcestis* and *Ion* that disillusioned master abandoned ideals of high morality and noble citizenship and the tragic conception with them. In the satirical fantasies of Aristophanes the main character is the chorus, which represents the polis, i.e. us, the *demos*, while in Menander the chorus, left to the care of producers, merely provides entr'acte entertainment. Because Menander's plays do not comment directly on political life, they were equally at home in any Greek theatre, i.e. they were international. The inheritor of the whole Classical age, Menander helped to define the lesser but still brilliant Hellenistic age for his viewers and for us. Our notion of comedy is his.

Meaning, Menander thought, now that freedom and glory are gone, must needs be sought in the paradoxes of private life, at home and on the street. His characters are types – the curmudgeonly father, the wronged wife, the clever slave, the sweet-souled courtesan – and his plots, with their coincidences, mistaken identities, belated recognition of foundling children, and acceptance of young lovers by parents, became so. Elements of them can be found hundreds of years later in the Greek romance "novels". His time is contemporary and his location often Athens or Attica. But these provide a framework for the lifelike and sympathetic exploration of the problems of everyday happenstance. Although there is always a love interest, his themes are various and lead to reconciliation in the family and with neighbours. Stylized romantic plots expose society's humdrum insecurities. The long modulated speeches so attractive to skilled actors in masks, the theatrical effects of surprise, the rapid dialogue in which one easy phrase may contain several meanings, the aphoristic wit, the moving direct appeals to the audience – the more we recover of him, the more diverse and profound he seems. His characters are rich, poor; old, young; male, female; free, slave; sophisticated, rustic; his range, so far as we can judge from the 5 per cent of his work that we know, is Shakespearean. (Hamlet's remark, "Conscience doth make cowards of us all", is taken from fragment 632.) His people quarrel, love, go to court, lend and borrow, yearn for riches and romance, get drunk, try to be good. His sympathy with slaves, for example, is almost unprecedented; in *The Farmer* he even shows a slave in love. His convincing understanding of human character, his colloquial and graceful language (mostly in iambic trimeter), and his sheer skill as a constructor of entertaining plays keep his work fresh and illuminating. He never moralizes, but he quietly puts forward ideals of tolerance, generosity, kindliness, and understanding. In other words, he is typically Greek in that he seeks *dike*, or justice – but in ordinary life, with forgiveness always the resolution.

Menander's immense skill is clearly evident in the early *Dyscolus* (The Curmudgeon), in the character of the gruff grouch Knemon, while the subtle clash and contrast of character and ethical principle in such plays as *Perikeiromene* (The Rape of the Lock), and *Adelphoe II* (Second Brothers), constitute his greatest achievement.

The works of most ancient writers have come down to us in tatters, and Menander, the last great poet of Athens, is no exception. Although he wrote more than one hundred comedies, only the *Dyscolus* (it won the prize in 317 BC) survives nearly intact; half a dozen plays are tantalizingly incomplete

but sufficient for literary judgement, and a sheaf of fragments completes our knowledge. The longer pieces were discovered on Egyptian papyrus strips only in the 20th century. The comedies of Plautus and Terence, who flourished a century after Menander, are often either a close adaptation or even translation of Menander or other New Comedy playwrights, so that Roman drama could hardly have existed without his example. Before the recent discoveries, most of his immense influence derived from them; now at least we have originals.

Menander's reputation, like that of Euripides, grew steadily after his death. Although he won only eight first prizes during his life, his plays became the basis of the comic repertoire. Because of this international popularity, he contributed to the fixing of the koine, or standard Attic Greek, that was the east's language of culture for hundreds of years. Byzantine students down to at least AD 600 and probably much later learned many of his sententious aphorisms, although in context (which was vanishing) these gnomes are always dramatic and often ironic. Now that Aristophanes, without his polis, was incomprehensible, comedy for a Greek, and indeed for us, meant Menander.

A few fragments have yet to be translated, and it is not unlikely that more will come to light. In our age of fragile relationships and moral confusion, we need them.

Biography

Born in Athens in 342 BC, Menander was a pupil of Theophrastus and a friend of Epicurus and Demetrius of Phalerum. As the author of over a hundred plays, he was and still is held to be the greatest playwright of New Comedy. His plays were popular in antiquity (he won eight first prizes) and were translated into Latin by Plautus and Terence. He died in 292, apparently by drowning in the sea off Piraeus.

Messene

City in the southern Peloponnese

Ancient Messene, located in the very centre of the modern province of Messenia, was one of the best-fortified cities of ancient Greece. Situated at the foot of Mount Ithome, it was protected by an acropolis. The city was named after Messene, the mythological first queen of Messenia, but it is not clear when it was founded. It is generally thought that the Theban leader Epaminondas founded Messene in 369 BC, after the battle of Leuktra. But Plato (*Laws*, 683d) and Isocrates (*Arch.*, 22), among other 4th-century BC authors, allude to the existence of the polis of Messene long before that date. Only later sources, such as Strabo (8. 58) and Pausanias (4. 1. 3–4), attribute the foundation of Messene to Epaminondas. Pausanias does however mention an earlier city on that spot, but refers to it as Ithome (4. 9. 2).

From 371 BC the Thebans diminished Sparta's power by uniting the Peloponnesian people in strong cities. Argos and Mantinea were fortified. The Arcadian League was formed with its newly built capital at Megalopolis. The independence of Messenia was to be guaranteed by constructing the walled city of Messene. In 369 Epaminondas sent envoys to southern Italy and Libya to invite the Messenians of the diaspora to return to their homeland. Many of them did so and thus they populated the city.

Messene was built in a short time, by the joint efforts of Thebans, Arcadians, Argives, and Messenians, who together laid out streets and built houses, temples and circuit walls. At the same time Epaminondas built a harbour for the Messenians, at Kyparissia on the west coast. Pherae (Kalamata) would have been more suitable as a harbour, but there the Spartan threat would always have been near. Epaminondas' master plan succeeded, and Sparta's power was restricted between the Taygetus and Parnon mountains.

When Philip II of Macedon led his troops against the Greek city states, the Messenians formed an alliance with him. They did not take part in the Battle of Chaeronea (338 BC), because they refused to bear arms against fellow Greeks. After Alexander the Great's death (323 BC), however, the Messenians joined the Greek revolt and thus lost their friendship with the

Macedonians. In 213 BC Philip V visited the citadel of Messene with his counsellors Aratus of Sicyon and Demetrius of Pharos, under the pretext of making an offering to Zeus. He was in fact planning to capture this attractive bastion and after making the offering he asked his counsellors for advice. Demetrius warned him that if he did not take the citadel, he perhaps would be sorry afterwards. "Remember that it is only by holding both his horns that you can keep the ox down" (Polybius, 7. 12). The horns referred to the bastions of Mount Ithome and the Acrocorinth, and the ox to the Peloponnese. Aratus advised Philip to withdraw, and thus avoid arousing the hostility of the other Greek states. Philip took Aratus' advice, but soon afterwards regretted it. The same year Aratus died, presumably poisoned by Philip. A year later Demetrius of Pharos tried to capture Messene by a surprise attack, but the inhabitants resisted fiercely and defeated the Macedonian troops. Demetrius was killed in battle.

Messene was finally captured by Nabis, the tyrant of Sparta, in 195 BC. He abandoned the city after a short time, due to the threat of an attack by the Achaean League. In 191 BC Messene was forced by the Romans to join the Achaean League and in 146 BC, like all Greek cities, it became part of the Roman empire. Hostility with Sparta continued to play an important role in foreign policy. As the Spartans favoured Octavian (later Augustus) in his struggle for power, Messene was forced to choose Mark Antony's side. After the battle of Actium in 31 BC Messene lost control of the cities in the Mani.

The city of Messene flourished until the end of Roman control over Greece. It remained the capital of the free Messenian state until the 4th century AD. In AD 395 the Goths destroyed and depopulated the city, which was never to be inhabited again. The village of Mavromati, between the ancient city and Mount Ithome, is a recent settlement.

On top of Mount Ithome stand the remains of the sanctuary of Zeus Ithomatas. It was there that Philip V of Macedon was tempted to seize the city. On the way down one crosses the remains of a temple. This might be the temple of Artemis Laphria, mentioned by Pausanias (4. 31. 7). However, an inscription found at the spot refers to Artemis Limnatis. Other public buildings revealed by archaeologists are a theatre and a stadium. The most striking feature of the city is the vast Asclepieum. The temple of Asclepius and his daughter Hygieia is surrounded by smaller temples of unknown use, a bouleuterion, an odeum, and, of course, baths. The Sebasteum to the north of the temple proves that the city flourished in Roman imperial times. The worship of Asclepius in Messene is also evidenced by the fountain in the centre of the city, assigned to Arsinoe, in Messenian mythology the mother of Asclepius.

The walls of Messene are as imposing to the modern visitor as they were to the ancients. Pausanias (4. 31. 5) was impressed by their construction and considered them stronger than those of Byzantium and Rhodes. The 10-km circuit connects the city with the acropolis on Mount Ithome. Two city gates are well preserved: the Laconian Gate on the saddle between Mount Ithome and Mount Eva and the impressive Arcadian Gate on the western side of the city. The wall is best preserved in this western section with its round and square two-storey towers occuring at intervals; it makes the site one of the most interesting examples of 4th-century BC architecture.

MAARTEN J. GROND

Summary

The chief city of ancient Messenia, Messene was traditionally founded by Epaminondas in 369 BC, following up his victory at the Battle of Leuctra. It was fortified with a particularly fine circuit of walls, much of which remains standing. Messene flourished during the Roman period but was sacked by the Goths in AD 395 and never inhabited again.

Messenia

Region of the Peloponnese

Messenia is one of the seven provinces of the Peloponnese. It covers the southwestern part of the peninsula. Like most Greek provinces its boundaries are formed by sea and mountains. The eastern approach is blocked by the inhospitable Taygetus ridge, which offers passage only far down in the Mani or through the Langada pass. To the north, Messenia ends halfway across the Tetrazion mountains. Here also access is only possible through narrow passes from the plain of Megalopolis and along the coast.

The province includes the fertile Messenian plain, which leads to the Messenian Gulf, and a narrow, more or less flat, coastal area to the west. These plains are divided from the north to the southernmost point by the Aigalion ridge, of which St Barbara is the most conspicuous peak (1112 m). Kalamata is the provincial capital and with its 44,000 inhabitants by far the largest city. Other local centres are Pylos (2000 inhabitants) and Kyparissia (4500 inhabitants).

According to Pausanias (4. 1. 1–2), Messenia owes its name to its first queen, Messene. She was married to Polycaon, the younger brother of the Laconian king. She was also the daughter of the king of Argos, and therefore too proud to be satisfied with her husband's minor role in Laconia. She took Polycaon and his retinue from Argos and Sparta and crossed the Taygetus mountains. This land from then on was called Messene. Many generations later, Messenia passed to the Neleid dynasty. Neleus and his son Nestor lived in prosperity in their palace at Pylos. Nestor took 90 ships to the Trojan War, which suggests he was the second most powerful ruler, surpassed only by Agamemnon. Nestor's wealth must have been based on the agricultural resources of the Messenian plain. The Linear B tablets, found in the Mycenaean "Palace of Nestor" near the modern village of Pylos, confirm this picture. The ruler of the palace subjected the population of Messenia to

a strict taxation system. The range and quantity of products were vast: wine, honey, wheat, barley, olives, figs, spices, pigs, horses, sheep, goats, etc.

After the Dorian invasion of the Peloponnese Messenia was assigned to Cresphontes. Much more violent were the Spartan invasions of the country, better known as the Messenian Wars. During the Archaic period, when other city states solved their overpopulation problems by setting up colonies, Sparta conquered Messenia and subdued its population. Much is written, but little is known about these wars. Pausanias gives a detailed report, but he undertook his travels in Roman imperial times. Therefore our knowledge of dates and facts is far from accurate. In the second half of the 8th century BC the Spartans for the first time crossed Mount Taygetus and attacked the Messenian plain. For 20 years the Messenians fought back, first under the inspiring leadership of their king Euphaes, a descendant of Cresphontes, and after his death under Aristodemus. Finally, however, the Spartan hoplites conquered the last Messenian stronghold on Mount Ithome. The Messenians kept their autonomy by paying the Spartans half of the produce of their land. After a rebellion in the second half of the 7th century many Messenians emigrated to Rhegium in southern Italy, where, in 493 BC, their descendants captured Zancle and renamed it Messana (now Messina). The remaining inhabitants were reduced to serfdom. The Third Messenian War (500–489 BC) may have kept the Spartans away from the battlefield of Marathon in 490 BC. The Fourth Messenian War (464–459 BC) was a Pyrrhic victory for the Spartans. Although Messenia was once again brought under Spartan dominion, exiled Messenians were settled by Athens in Naupactus. It was these Messenians who in 425 BC supported the Athenians at the siege of Sphacteria and thus put an end to Sparta's reputation for invincibility. After the Peloponnesian War the Messenians were driven from Naupactus by the Spartans and again went in exile to southern Italy and to Euhesperides in Libya (later Berenice). Finally, after the Battle of Leuctra (371 BC), where the Spartan army was defeated by Theban forces, Epaminondas repatriated the Messenians from the diaspora and built (or refortified) for them the strong city of Messene at the foot of Mount Ithome. He also rebuilt Kyparissia, to be used as the port and harbour of Messene. Sparta never regained control of this area and Messenia remained independent until the Roman conquest of Greece in 146 BC.

Information about Messenia under Roman rule is very scarce. The country seems to have had a certain kind of autonomy, but being a part first of the province of Macedonia, and after 31 BC of Achaea, Roman authority was never far away. Emperor Augustus gave the cities of the Mani to Sparta; Tiberius assigned the cities on the western flank of the Taygetus mountains to Messenia.

The barbarian raids of the 4th century AD mark the end of antiquity. Alaric and his Visigoths invaded Greece and sacked the major cities and sanctuaries. In AD 395 the city of Messene was destroyed and depopulated. It does not appear to have been reinhabited in the medieval period. During the 7th and 8th centuries AD Slavs settled in Messenia. Medieval city names such as Sitsova, Tsernitsa, and Gialova are proof of this immigration. Byzantine families built fortresses over ancient foundations in Kyparissia and Kalamata.

From the 12th century on, Frankish crusaders started building strongholds in the Peloponnese. Counts from Belgium and France occupied parts of the country and built impressive fortresses mostly at inaccessible places. Geoffrey I de Villehardouin erected the *kastro* at Kalamata; Nicholas II de Saint Omer built the fortress of Palaiokastro, on the site of ancient Pylos. At this time, too, Venetians appeared in the area. In order to defend their trade routes to the Levant they erected seaside strongholds, such as Methone and Corone. For 300 years the Venetians controlled the country.

From 1460 on, the Turks started to play a role in Messenia. Sultan Mehmet II conquered the country, leaving only Methone, Corone, and Palaiokastro to the Venetians. In 1500 Sultan Bayezid II captured Methone after a month's bombardment, thus bringing all Messenia under Turkish rule. Strategic points such as Methone, Corone, Palaiokastro, Neokastro, and Kalamata were reinforced. Apart from the brief second Venetian period following Morosini's conquest in 1685–1715, Messenia remained in Turkish hands until the War of Independence.

Kalamata is said to have been the first city to have revolted against the Turks in 1821. Ibrahim Pasha's counterattack in 1825 once again destroyed the Greek hope for freedom. However, they did not have to wait long for the decisive move in this war. In July 1827 France, Great Britain, and Russia signed the "Triple Alliance" in London: Turkey should stop its war in Greece within a month. After the one month had expired, the Turks had not only ignored the Treaty of London, but had reinforced their fleet at Navarino. On 20 October 1827 an allied fleet, numbering 26 warships, entered the bay of Navarino, as a warning to Ibrahim Pasha to withdraw his Turko-Egyptian fleet from the Peloponnese. After some unsuccessful negotiations a few shots fired by the Turks brought about general action. In four hours the Turkish fleet had lost 55 ships and 6000 men. The allies lost 174 men, but not a single ship. The victory at Navarino weakened Turkish power in the Morea. In 1828 the French general Maison landed 14,000 troops in Petalidi, thus causing the hasty departure of the Turkish occupying force. The French soldiers immediately started to restore the country's infrastructure, by founding and building the new village of Pylos and by constructing a road from Pylos to Methone.

Nowadays Messenia is still an agricultural area, where the cultivation of olives and grapes provides the people with a certain degree of wealth. Tourism on the other hand has not yet fully developed, mainly because the road system is not adapted to modern traffic. Therefore visitors are welcomed heartily and the hospitality that Telemachus enjoyed at Nestor's court in *Odyssey* book 3 is still available.

MAARTEN J. GROND

Summary

This province in the southwest Peloponnese was named after Messene, daughter of the king of Argos. It was ruled by Nestor in the Bronze Age. It was occupied by Sparta in the Archaic period in a series of Messenian Wars, though the Messenians retained their autonomy for much of the Classical period. Kalamata claims to be the first city to have revolted against the Turks in 1821. The area relies on agriculture for its wealth.

Metalwork

A knowledge of the processing of metals came to the Greek world in the Early Bronze Age (3000–2000 BC), in all probability from the east. The finding and working of copper and iron are attributed by such authors as Dioscurides, Strabo, Pliny, and Diodorus Siculus to the mythical demons, the Cabiri (Phrygian) and Curetes (Cretan).

In Homer we have the earliest description of the way in which a coppersmith's shop operated; the coppersmith is Hephaestus, god of fire, himself a deity who came from the island of Lemnos in the Aegean. The first examples of the coppersmith's art were found in the Cyclades – the Zia cave on Naxos, Kefala on Kea – at Knossos in Crete, at Yali in the Dodecanese, and in Cyprus. The on-the-spot processing of the metal copper and its alloy bronze required collective action, the pre-existence of deposits, and organized trade. We possess no more than 100 metal objects from Neolithic Greece.

In the Early and Middle Bronze Age (3000–1450 BC) metal vessels imported from the Near East seem to have affected the shapes of ceramics in Thessaly (Dimini, phase 1), although there is early evidence for the morphological independence of metal objects in the Greek world. There is a silver *skyphos* (cup, can) from Amorgos in the Cyclades, another *skyphos*, and two gold vessels of primitive shape in the Benaki Museum in Athens. Gold *kymbes* (cups) and elliptical *skyphoi* with a spout seem to have served as drinking cups – such as the one found at the Heraea of Arcadia (in the Louvre), which has been shaped by hammering from a single leaf of gold, apart from the handle. These show that the inhabitants of mainland Greece also made vessels from precious metals.

In Crete silver objects from the early Minoan period have been discovered on the islet of Mochlos. One cup, with a handle, was full of gold jewellery. In the Minoan palace period (Knossos, Mallia, Phaestus) a brilliant civilization, considered to be Europe's first, developed; it dominated the whole of the Aegean and had constant contacts with the east and with Egypt. At the beginning of the 2nd millennium BC metalwork and metal vessels developed to the point where they became models; their shapes were copied and their grooved and chased naturalistic decoration appeared in paint on ceramic vessels. The horde discovered at Tôd in Egypt (tomb of Amenemhet, 1940–1938 BC), consisting of 153 silver cups and only one in gold, is in all probability from Crete. There were deposits of silver on certain of the Cyclades, at Akrotiri on Thera, and in the Laurium region in Attica, all workable before 1600 BC.

The commonest type of vessel made of gold or silver in Crete seems to have been the drinking cup. The gold cup with relief decoration consisting of spirals and rosettes from the so-called Aegina Treasure in the British Museum must also be Cretan. Objects made by the "Kaptaru" (Cretans) were, according to texts from Mari in the mid-Euphrates, much sought after. Small scale carving (seal carving) and the art of metalwork reached their highest point during the "New Palace" period, which produced superb chased ritual swords with inlaid gold, decorative gold double axes – symbols of the Minoan religion (votive offerings from the sacred cave of Arkalochori, of 1600 BC, in the Herakleion Museum), figurines, chased or cast, relief or engraved vessels, inlaid with sacred bulls' heads, and bronze *lebetes* (cauldrons) to hold a whole sheep for boiling. The handles of cups and the upper part of closed vessels such as *prochoi* (jugs) and *hydriai* (water jugs) were made from separate pieces of metal; although it seems that the craftsmen of the Aegean area knew the art of soldering, they nevertheless preferred to join the parts by riveting.

The eruption of the volcano of Thera (Santorini) around 1500 BC swept away the peaceful matriarchal and refined Minoan civilization which was succeeded by the equally brilliant Mycenaean civilization of mainland Greece. Large centres of Mycenaean culture have been identified at Mycenae, Tiryns, Pylos, Athens, Thebes, Orchomenus, and Iolcus. The best-known branch of art in the early part of the Mycenaean period, influenced by the Minoans, is metalwork, as is illustrated by the wealth of vessels, tools, and jewellery found in the royal tombs, reminiscent of the high standard of living; figurines are comparatively few. Purely Mycenaean metalwork makes its appearance in the many bronze household utensils – in all their different forms with engraved or relief ornamentation – that were handed down from generation to generation as heirlooms or dowries (the Dentra tombs, the hearth with the tripod at Knossos, Perati in Attica, Curium in Cyprus). The fine gold cups from a tomb at Vapheio (Sparta), for example, show the capture of wild bulls (Athens Archaeological Museum). Also striking are the huge bronze figure-of-eight shields and gold engraved seals, the swords decorated with inlaid gold and niello (a blue-black alloy of copper and silver with sulphur), and the gold masks made to adorn the faces of dead kings and notables, with their imposing features, such as that once thought to be Agamemnon's with its engraved moustache and beard.

The Panhellenic campaign of the Achaeans against Troy is an indisputable historical event. A dramatic scene from a siege is shown on the famous "siege *rhyton*" (drinking horn) from the acropolis of Mycenae, grave IV (Athens Archaeological Museum). At the time of the campaign against Troy and in the early 12th century BC that followed, there was a distinct decline in the arts throughout the Aegean, coinciding with the destruction of the centres of Mycenaean civilization for reasons that are unknown to us. Nevertheless, there was a significant change in the technology of metals, bronze being replaced by iron for tools and weapons, though metal objects were rare. In the 11th century BC the early Geometric style marked the beginning of a long process leading in the end to the achievements of Archaic and Classical Greece.

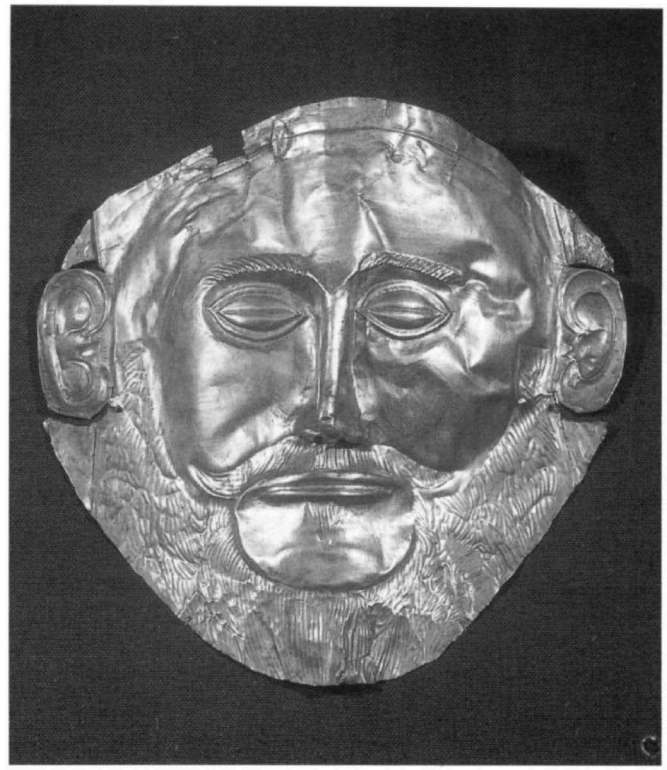
The establishment of Greek colonies, from the Pillars of Hercules, Italy, Sicily, the Crimea, and Asia Minor to Phoenicia, brought a lively trade with the Near East, which gave a new boost to the demand for and working in metals. The development of metalworking from the early 8th century BC onwards was impressive. All the metal figurines (of copper or bronze), male and female, are shown nude. The females convey a sense of immobility, with their arms held down the sides of the body, while the male figurines, which form the overwhelming majority down to the 8th century BC, are shown with their hands raised in an attitude of worship, as in the case of the male figurines from Gazi and from Karfi in Crete. In the Geometric period the stylized depiction in figurines of animals such as the lion and a great number of bronze colts from workshops at Argos, Olympia, Corinth, and Laconia made its appearance.

Around 725 BC bronze figurines from Attica take a more naturalistic and less stylized form. The beginnings of the depiction of organic details (clavicles, chest muscles, indication of the locks of hair) can be seen in the figure of a warrior wearing a helmet, from the Acropolis.

Before the end of the Archaic period, scenes from everyday life made their appearance in metalworking, together with figures such as a drinker or flute-player from Sparta or Olympia, a lyre player from Herakleion in Crete, an archer from Delphi, and a number of compositions in bronze, such as charioteers on their chariots, the most important example being the well-known *Charioteer of Delphi*. In historical times iron, and a knowledge of how to work in it, prevailed over bronze throughout the Greek world, without the use of bronze going completely into abeyance. Nevertheless, since iron rusts and breaks up, only a very few examples have survived, such as a gilded iron ring in the Athens Archaeological Museum. One of the regions richest in copper ores was Cyprus – hence the Latin *cuprum*. Homer knew of the copper of Tamassos in Cyprus, which he mentions in the *Odyssey*.

It was from Cyprus, from around the middle of the 2nd millennium BC, that a standardized mass of pure copper in the shape of a pillow, weighing one talent, went to many parts of the ancient world as raw material. Sardinia and southern Spain (Tartessus) were also important sources of copper. The origins of the tin that was necessary for the hardening of the prehistoric alloys remain obscure – perhaps it came from Afghanistan – but in historical times we know that the tin used was derived from the Tin Islands (Cassiterides) – Britain – and that it reached the Mediterranean via the Iberian peninsula and Gaul. Lead may also have been used for the hardening of the alloy. This was to be found in large quantities in Greece, for example, in the mines of Laurium, as a by-product of the production of silver (tin was totally absent).

The two principal methods of making bronze objects (figurines of animals or human beings, tripods, jewellery) in early antiquity, and throughout the centuries down to the present, were the casting of the molten alloy in a suitably prepared mould (such as, for example, the plaster moulds of the late 10th century BC from Lefkandi on Euboea for the making of tripod feet), and beating it out with a hammer. The best bronze sheeting had a 5–10 per cent admixture of tin. An increase of the tin content rendered it fragile, but gave it a superb yellowish colour like gold, as is demonstrated by the famous Derveni *krater* (mixing bowl) of Hellenistic times, whose metal has a 15 per cent tin content. The chasing technique was used extensively in the 8th and 7th centuries BC for the production of statues of medium size. Famous works of chasing are the *Divine Triad* of the 8th century BC from Dreros, Crete, of a height of 0.80 m, nailed to a wooden core (Herakleion Archaeological Museum), and the silver bull from Delphi of the 5th century BC. In the case of larger cast statues, for reasons of economy of the metal, from the mid-seventh century BC the technique known as the "lost wax" method was devised.

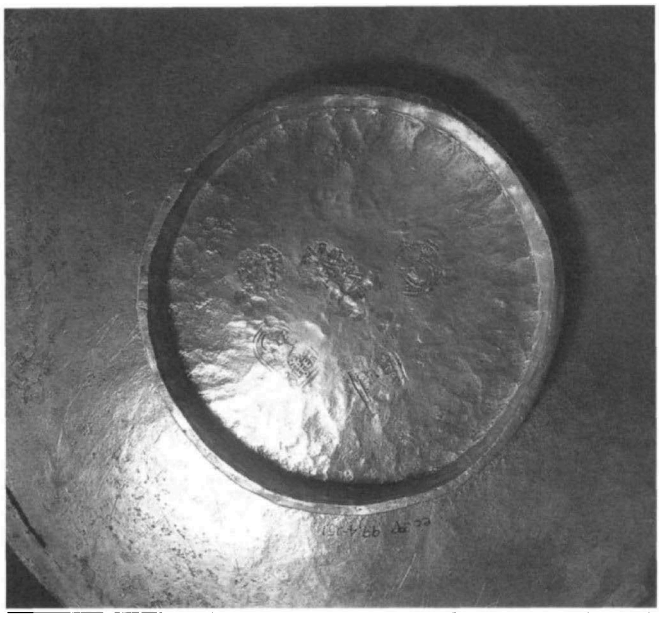


Metalwork: gold death mask, the so-called Mask of Agammemnon, Mycenae, late 16th century BC, National Archaeological Museum, Athens

From the 5th century, meanwhile, a new technique of "indirect" casting came to be used whereby a clay model was made and a mould ("negative") was produced from this, making it possible to have a large number of identical cast objects. The details, such as the hair, the eyes, and the nails, were incised with a sharp instrument. Often the pupils of the eyes were of inlaid ivory, and the nipples and lips of plain inlaid bronze.

The success of the Athenians and their allies against the Persians (490–479 BC) led to the splendours of the age of Pericles and of Classical Greece with its humanistic philosophical systems and its universally admired art. The Chalkotheke, the building next to the Parthenon on the Acropolis of Athens, housed the metal votive offerings to the goddess Athena – some of bronze, but chiefly of precious metals.

The Spartan Telestas, of the 6th century BC, and the great Myron, of the 5th century BC, belong to the same category of craftsmen: they were at one and the same time workers in bronze and silversmiths. Myron is credited with the making of silver drinking cups, while the great sculptor Phidias himself



Metalwork: silver plate, probably for holding the Eucharistic bread, Cyprus, *c.*580, British Museum, London

produced the parts in silver of the chryselephantine Zeus, as can be seen from the earthenware moulds found in his workshop at Olympia.

Herodotus tells us that Corinth was an important centre of working in bronze. In Classical times, gold and silver vessels, chiefly *hydriai*, were made in southern Greece, as can be seen from the catalogues of the Chalkotheke on the Acropolis, but not a single one has survived. In the 4th century BC, bronze figurines and *hydriai* for funerary purposes ceased to be made at Athens, while *hydriai* and receptacles for ashes continued to be produced in gold and silver. In Magna Graecia, Tarentum was an important centre for repoussé metalwork. Silver folding mirrors with scenes in relief and silver vessels with gilt details, now in the Metropolitan Museum of Art in New York, have been found in tombs.

Modern archaeological research has demonstrated that the inhabitants of central Macedonia (Sindos) in the 6th century BC, and those of Acanthus in Chalcidice (a colony of the island of Andros), were silversmiths of exceptional skill, producing silver cups, kraters, etc. (Herodotus, 7. 119). The silver mines of Siphnos and Lesbos, and later those of Laurium in Attica, have provided us with valuable information on the advanced technology in this field.

The biggest centre for such work in Hellenistic times was Alexandria, and a striking description of the city of Ptolemy II Philadelphus (271 BC) is given by Athenaeus in his *Deipnosophistai* (5. 196a–203b). The city's luxury and wealth were fabulous. In its processions 1600 children each carried a gold and a silver vessel, and Athenaeus describes a vast silver *krater* with relief decoration of the Samian type and four equally enormous gold *kraters* of the Laconian type with vine wreaths, etc. These descriptions should not be regarded as exaggerations, since they correspond to the vast quantities of gold and silver vessels that were paraded in the streets of Rome as spoil from Greek cities conquered in Magna Graecia and Sicily in the late 3rd century, and from Greece itself in the first half of the 2nd century BC. Greek metal workers settled in Rome and brought their art with them (witness the masterpieces from Pompeii). A find of exceptional rarity came to light at Dion in 1992. This is a bronze *hydraulis* (water organ) of the 1st century BC. The first *hydraulis* was made in Alexandria by the engineer Ctesibius. In the Middle Ages this instrument developed into the church organ of the Western Church.

Until Classical times the products of metalworking were not made for interior decoration or to serve as collectors' items. But from the moment that Lysippus made a small-scale "table-top" Heracles for the symposia of Alexander the Great in the 4th century BC, a new relationship grew up between humans and works of art. From then on, statuettes were used for the decoration of rooms or for collection and consequently forgeries started. After the Battle of Pydna (146 BC) the Roman soldiers prised open Greek graves at Corinth, for instance, in order to collect, for sale in Rome, the *nekrocorinthia*, bronze vessels that were grave offerings, the *signa Corinthiae* statuettes, and much sought-after bronze vessels, the *aeria Corinthiae*.

In Byzantine times the art of cast bronze flourished in many centres of the empire: Italy, Egypt, Asia Minor, Syria. Later, when the Byzantines lost their provinces, working in bronze was confined to Constantinople itself and mainland Greece. An equestrian statue of the emperor Theodosius I survived until the city fell to the Turks in 1453; it was, however, subsequently destroyed. Another colossal statue was taken by the crusaders in 1204 to Bari in Italy. The statue consists of cast plates, made separately and then assembled, exactly like the Greek statues of the Geometric and Classical periods.

With the triumph of Christianity, craftsmen turned to the production of objects for liturgical and domestic use: cast crosses, large ones for churches and smaller ones to be worn, candlesticks, lamps in various designs, censers, some with scenes from the life of Christ (the most sumptuous of these are today in Vienna), and items of every kind for the household with figures in relief and vegetal decoration. Designs differed as they followed varying trends, but these objects continued to be produced throughout the Byzantine period. The craftsmen who cast them had their own quarter in the city of Constantinople.

The most noteworthy works to have survived are the large monumental bronze doors with lions' heads from which the knockers hang and rich foliate decoration with crosses (Hagia Sophia in Constantinople; St Mark's in Venice; and a double door, said to come from Hagia Sophia, preserved in the Vatopedi monastery on Mount Athos). Many bronze weights with busts of emperors have survived, while a bronze plaque with inlaid silver of the 4th century AD is today in the Louvre and another in the Florence Archaeological Museum. A superb portable triptych of gilt bronze has survived intact, now in the Victoria and Albert Museum in London.

The Helsinki treasure (4th century AD), today in London, was produced in Rome but, like the silver objects in the Mildenhall treasure in London and the Traporain treasure in Edinburgh, already shows eastern features. Byzantine style manifests itself more clearly in a large disc portraying the emperor Theodosius I (AD 388), in Madrid, a work produced in Thessalonica.

In the time of Justinian (527–65), imperial stamps appear on the reverse of many of the works of silversmithing; these are a great help for historical and stylistic classification. At this period we find a clear preference for ancient Greek mythological subjects, as on a silver disc with a Silenus at Dumbarton Oaks. In the 6th century, as Corippus and Paul the Silentiary inform us, the churches and palaces of Constantinople were packed with works of art in gold and silver, votive crowns, altar revetments, and the great "automata" of the palace, covered in enamel. Of these, nothing has survived.

The period of iconoclasm (726–843) was a setback in the field of metalwork, but the workshops continued to operate. Under Basil I (867–86), metalworking flourished afresh, with many works in gold and silver for sacred and secular use. The sanctuary of churches now tended to be enclosed by the iconostasis, which was often adorned with enamelled plates, as in the Pala d'Oro of Venice. The Byzantine silver- and goldsmith matched the vivid colours of the enamel and of precious stones to the precious metals, and to the bronze, and this new technique was the triumph of Byzantine craftsmanship. The few examples that have survived are on Athos or in St Mark's in Venice. Small portable icons were also adorned with plates of silver and enamel which left visible only the unclothed parts of the figures' bodies.

With recent memories of Byzantine civilization as a model, modern Greek gold- and silversmithing, continuing an even older, "atavistic" tradition, absorbed and reshaped an aesthetic based not only on indigenous features but also on those borrowed from the West and the East. These arts during the difficult centuries of Ottoman rule are marked by a spontaneous inspiration and originality. There is no evidence for the trading in and export of the products of metalwork at this time. There were, however, blacksmiths' and coppersmiths' shops in many villages in Greece, particularly in Chalcidice, Pelion, and the Peloponnese, and here occupational and household tools and utensils were made and repaired. Tools made of iron have Greek names: *amoni*, *physero*, *sphyri*, *sidero*, *molyvi*, *kleidaria*, *syrtis*, etc. These items were worked by hammering from a single sheet of metal as they had been in antiquity; now, however, they were often engraved and decorated with niello – a technique very widely used in the modern Greek period, as it had been in the Mycenaean.

In the 19th century, with the Industrial Revolution and the liberation of the Greeks from the Ottoman occupation from 1821 onwards, the first halting steps were taken towards industrialization. The year 1864 saw the revival of smelting at Laurium of the ancient plumbiferous scoria by the French–Greek–Italian Roux company. From 1935 onwards there was an increase in mining production, and exports were made. Metallurgical manufacturing developed, producing items for household use, for building work, and engineering purposes: electric motors, farming implements, items for aircraft repairs, etc. There are still a very few workshops in the principal urban centres where silver objects, intended for gifts, are worked by hand with the repoussé technique. However, efforts are being made by various bodies, with the Benaki Museum in the lead, to teach lost techniques by means of seminars, and there are now more than 200 people who have learnt the ancient craft of chasing with handmade tools such as those used in antiquity.

Metaphysics

Metaphysics is the study of the ultimate nature of everything. The topics investigated include being, body and mind, souls and God, space and time, matter and motion, causality, identity and change, possibility and necessity, particulars and universals. Basic questions include: what is everything made of? Is it one "stuff" or many "stuffs"? What is the nature of the ultimate? What is appearance and what is reality?

Metaphysics literally means "after (*meta*) physics (*ta physika*)". Tradition says the name was first used by the librarian Andronicus of Rhodes (1st century BC) who was cataloguing the collected works of Aristotle. Faced with an untitled work, he labelled it *Metaphysics*, because it was the next book placed on the shelf after the books Aristotle wrote on physics.

The study of metaphysics began with the speculations of the pre-Socratic philosophers. For about 200 years prior to the time in which Socrates flourished this rather varied group of thinkers sought answers about the nature of ultimate reality. The first of them was Thales (*c.*625–547 BC) of Miletus in

Ionia. Seeking to understand nature, in terms of nature itself, Thales speculated that the source of all things in the visible world was water.

Thales' protégé at Miletus, Anaximander (*c.*610–540 BC), was the second member of the Milesian school. He speculated that the ultimate was the "boundless" or "unlimited" (*apeiron*) which was a sort of odourless, tasteless, colourless, weightless, "stuff" out of which everything comes. The "boundless" also moved in a sort of vortex motion to produce the visible things of the world.

Anaximenes (*fl.* *c.*546 BC) was the third and last of the Milesian school. He speculated that the first principle of all things was air. His great achievement seems to have been the suggestion that there was continuity and serial development in the pattern of the condensation of air "downwards" into denser materials and the corresponding rarefaction of dense material "upwards".

Xenophanes (*c.*570–478 BC) of Colophon objected to the theology of the poets. His problem with Homer and Hesiod, as well as many other poets, was that they told stories of the gods and goddesses engaging in shameful behaviour. They could be hateful, violent, capricious, selfish, adulterous, lying, and scheming. He speculated that there must be one ultimate god who was the source of all.

Heraclitus (*fl.* *c.*500 BC) of Ephesus is famous for the saying, "I step into a river once, but I cannot step into the same river twice." By this he speculated that the only thing that does not change is change. He identified the ultimate stuff of the universe with fire, but also found it to have order inherent in it. The ordering principle he identified as reason (*logos*). The Ionians (discussed above) were materialistic in their cosmological explanations. They were also monists (claiming that there is only one kind of basic reality) The Italian school (Pythagoras, Parmenides, Zeno, Melissus, Empedocles), on the other hand, claimed that ultimate reality was of more than one kind.

Pythagoras (*fl.* *c.*530 BC) of Samos moved to Croton on the south Italian coast. According to tradition, one day he passed by the blacksmith's shop and heard different pitches from hammers ringing on anvils. From this experience he developed a theory of music and a theory of the origin of the universe. For Pythagoras the discovery of quantity in everything led to the speculative belief that everything is made of numbers. This view replaces a material cause of the universe with a non-material one, namely numbers. So the origin of the universe can be viewed as coming from an intellectual source.

Parmenides (b. *c.*515 BC) of Elea learned of the views of Heraclitus and completely rejected the argument that the world is constantly changing. Instead he argued that change is an illusion. For Parmenides everything that exists has being, and being is the basic stuff of the universe. To say that something has being means that it is. But, if it is, then it cannot both be and not be. Change, or becoming, means that something both "is" and simultaneously "is-not". For Parmenides something either "is" or it "is-not". For something to exist and not exist at the same time would violate the laws of logic. What is can neither be created nor be destroyed, so change he concluded is an illusion.

Zeno (*c.*490–454 BC) of Elea was a younger follower of Parmenides. He developed a number of paradoxes to defend the view that change is an illusion. Most of these paradoxes argued that motion is an illusion. The paradoxes include the Stadium, the Arrow, Achilles and the Tortoise, and the Grain of Millet.

Melissus (*fl.* mid-5th century BC) of Samos, famous as an admiral, became a follower of Parmenides and produced a book entitled *On Nature and Being*. Among his contributions is the view that there exists a plenitude of being in the cosmos.

Empedocles (*c.*492–432 BC) of Acragas in Sicily was a member of the pluralist school. He accepted Parmenides' principle of being as a starting point and then postulated four basic "stuffs" – earth, air, fire, and water. These were the roots of things. They combined and separated through love and strife. Yet these are merely appearances.

Anaxagoras (*c.*500–428 BC) of Clazomenae was also a member of the pluralist school. His great contribution is the idea that there is a mind that organizes the clumped stuff of the universe into an ordered whole. Unlike the Creator of Genesis who issues divine commands, Anaxagoras' creator-god is pure mind which distinguishes and separates qualities to produce an ordered cosmos.

The Atomist school comprised the last of the pre-Socratics. Leucippus is considered to be the father of the school. Little is known for certain about his views; however, it is generally believed that his younger follower, Democritus (b. *c.*460 BC) of Abdera, preserved and developed his speculations. Democritus is reported to have said, "I take this material and I cut it until it can be cut no further and I have the basic stuff of the universe, 'the uncuttable' (*atome*)." An *atomos* of Democritus is different from modern atoms. It is like a tiny rock, the centre of which cannot be split. Democritus taught that there are a myriad different atoms which combine by physically hooking together rather like burrs on clothing, or run freely in liquid fashion like marbles. The resulting view is that there is a plurality of atoms. Furthermore, Democritus taught that everything is made of atoms moving in the void. Even the gods are made of atoms. This meant that only atoms moving in the void were eternal. The gods, goddesses, the world, and all people were simply the product of a chance combination of atoms. Even souls were the product of atoms. In addition the forces of movement in the void would eventually produce a new rearrangement of the atoms and therefore even the gods were not immortal.

When pre-Socratic speculation failed to reach a single unified answer about the nature and origin of the cosmos, intellectual attention turned to other concerns. The Sophists focused on rhetoric, and Socrates on social philosophy and ethics.

Plato (*c.*429–347 BC) gave metaphysical speculation new life. Plato was deeply influenced by the teaching of the Pythagoreans. Seeking to explain both change and permanence, he combined the ideas of Heraclitus and Parmenides. Plato used the Socratic method of dialogue to seek for knowledge of the ultimate. He found the ultimate nature of the universe to be derived from ideas. Just as everything in the universe has quantity, so it also has a shape or a form (*ideos*). In the forms of things he found the ultimate stuff of the universe. The visible world is ever a world of Becoming, composed of copies of the eternal forms. These reside in the invisible world of Being. In the *Timaeus* he describes how a

creator-god mixes the forms with matter to make the visible world.

Aristotle (384–322 BC), the most famous of Plato's students, wrote about the topic of metaphysics calling it "first philosophy" because it dealt with the first things of the cosmos. Among his metaphysical ideas are the four causes: material, formal, efficient, and final. He rejected Plato's forms for being as substance. Aristotle's great achievement was to summarize in an orderly fashion and extend the speculations of the Classical period.

After the death of Aristotle the changed political conditions brought about by the conquests of Alexander the Great reoriented the focus of philosophical speculations to "philosophies of withdrawal". Cyrenaics, Epicureans, Sceptics, Cynics, and Stoics all advocated philosophies of life which sought to find meaning in life apart from the state. Epistemology, ethics, and social philosophies were the main concern.

Neoplatonism developed a rich literature of metaphysical speculation that posited God as the source of the forms. From the 3rd to the 6th century AD this philosophy developed the idea of the chief form being the One. The One emanates or overflows in being to create the visible world. The most important members of this school were Plotinus and Proclus.

Christians encountered a dynamic mix of philosophical schools in the Greek-speaking world. In particular they found three competing cosmologies widely discussed: pantheism, materialism, and Platonism. Of these three Platonism was closest to the Christian view on the origin and nature of the world. As people of philosophical training became Christians they applied their philosophies to theological interpretation for both apologetic and dogmatic purposes.

The emperor Constantine I the Great, seeking to unify his empire on a religiously uniform basis, called for an ecumenical council of the Church to meet at Nicaea in AD 325. The debates and resulting creed were fraught with philosophical metaphysical ideas. These were used to describe the nature of the Trinity. Later councils would also deal with the *Logos* Christology of the Gospel of John in order to describe the two natures of Christ. For its theological needs Christianity utilized Greek metaphysical ideas.

Byzantine history continued the story of the development of the association of philosophy and Christian faith. Philosophy was a frequent topic for study, but little original work was done until the 11th century when there was a great revival of Platonism led by Psellos. John Mavropos, bishop of Euchaita, was a devoted Platonist. John Italos developed some heretical ideas from Pythagoreanism. The most original of the Byzantine philosophers seems to have been George Gemistos Plethon (*c.*1360–1452), who was the last great Neoplatonist.

Metaxas, Ioannis 1871–1941

Army officer and dictator

Metaxas's dictatorship of 1936–41 saw the imposition of a regime similar in many ways to other European dictatorships of the period, during which the state became increasingly important. His firm leadership at the start of World War II at first defended Greece from an Italian invasion.

Metaxas was born on the island of Ithaca on 12 April 1871. Choosing a military career, he attended the Greek Military Academy, graduating in 1890. He saw active service in the 1897 Graeco-Turkish War, after which he was sent to Germany to attend the War Academy at Berlin, returning in 1903. In 1912 Venizelos, the prime minister, embarked on a modernization of the army which he entrusted to crown prince Constantine, who in turn appointed Metaxas to the General Staff. Metaxas became a loyal supporter of Constantine and a lifelong monarchist. In 1913 he was promoted to colonel and became Chief of the General Staff. At the outbreak of World War I Constantine (by then king) and Metaxas agreed that it would be folly for Greece to become involved, a view not shared by Venizelos. Promoted to general in 1916, Metaxas left Greece when Constantine vacated the throne in 1917. He was tried for treason in absentia, but was pardoned in 1921 and returned at Constantine's restoration. He took no part,

however, in the disastrous Asia Minor campaign, having consistently warned of the military folly of such a venture. When a republic was proclaimed in 1923, he participated in an abortive monarchist coup, after which he again left Greece. When he returned, he founded his own pro-monarchist Free Opinion Party. In 1928 he briefly held office as minister of communications, going again into opposition for a further seven years. In 1935, with the restoration of the monarchy, Metaxas accepted office as a minister of state without portfolio, and then as minister of war. Shortly afterwards the prime minister died, and king George II turned to Metaxas, who with only six followers in the parliament became prime minister in April 1936. His way was smoothed by the chance fact that many of Greece's senior statesmen died in 1936: Georgios Kondilis (in January), Eleftherios Venizelos (in March), Panayoti Tsaldaris (in May), Paul Kondouriotis (in August), and Alexandros Zaimis (in September).

Metaxas moved rapidly to consolidate power in what he saw as a dangerous period for Greece, both domestically with the problems caused by the world economic crisis and externally in a Europe drifting towards war. On 4 August he suspended parliament, which as events transpired would not meet again for a decade. Metaxas was now, in effect, dictator of Greece. Freedom of the press was abolished, censorship was introduced (even of some of the classics), and some opponents were sent into internal exile. Though he was not a fascist, Metaxas's regime rapidly began to adopt many of the attributes of other contemporary authoritarian regimes. He talked of creating a Third Hellenic Civilization, the first two being those of antiquity and Byzantium. As part of this ideal, and to lessen the linguistic schism, he promoted demotic Greek over katharevousa, commissioning the first demotic grammer. Underlying the concept of the Third Hellenic Civilization was the aim of rebuilding the country by returning it to its roots, removing the un-Hellenic accretions of recent centuries. A compulsory National Youth Organization (*Ethnikos Organismos Neoleas*, EON) was created to co-opt the young, whose members had to be deemed to be true Hellenes, not Jews or other minorities. EON was the first mass organization to be introduced in Greece. Metaxas used titles to describe himself such as "First Peasant", "National Father", and "Leader". He envisaged a much greater role for the state in national life, introducing social insurance, a minimum wage, maternity benefits, child welfare legislation, compulsory labour arbitration, and peasant debt relief, and he embarked on a ten-year programme of public works to improve the country's infrastructure.

As Europe entered World War II, Greece could not avoid becoming caught up in the vortex. In October 1940 Italy, having already occupied Albania, turned on Greece. Metaxas was awakened at 3 am on 28 October to receive an ultimatum from Italy's ambassador. With firmness and dignity he rebuffed the humiliating demands. Known as Ochi ("No") Day, 28 October has been a public holiday in Greece ever since. The Italian dictator had assumed on the basis of old reports that morale in the Greek army was low, but Metaxas had paid particular attention to rebuilding the army which now threw back the invaders and proceeded to occupy much of southern Albania. At the height of these successes Metaxas died unexpectedly at the end of January 1941. His resoluteness in defending Greece against the Italian fascist aggressors did much to redress his image as one of Europe's crop of interwar right-wing dictators.

ERIK GOLDSTEIN

Biography

Born in Ithaca in 1871, Metaxas was educated at the Greek Military Academy and saw active service in the Graeco–Turkish War of 1897. A staunch monarchist, he opposed Greece's involvement in World War I and in the Asia Minor campaign. He was appointed minister of war in 1936 and later that year became prime minister (effectively dictator) until his death in 1941. He rejected the Italian ultimatum of 28 October 1940 and drove back the Italian invaders.

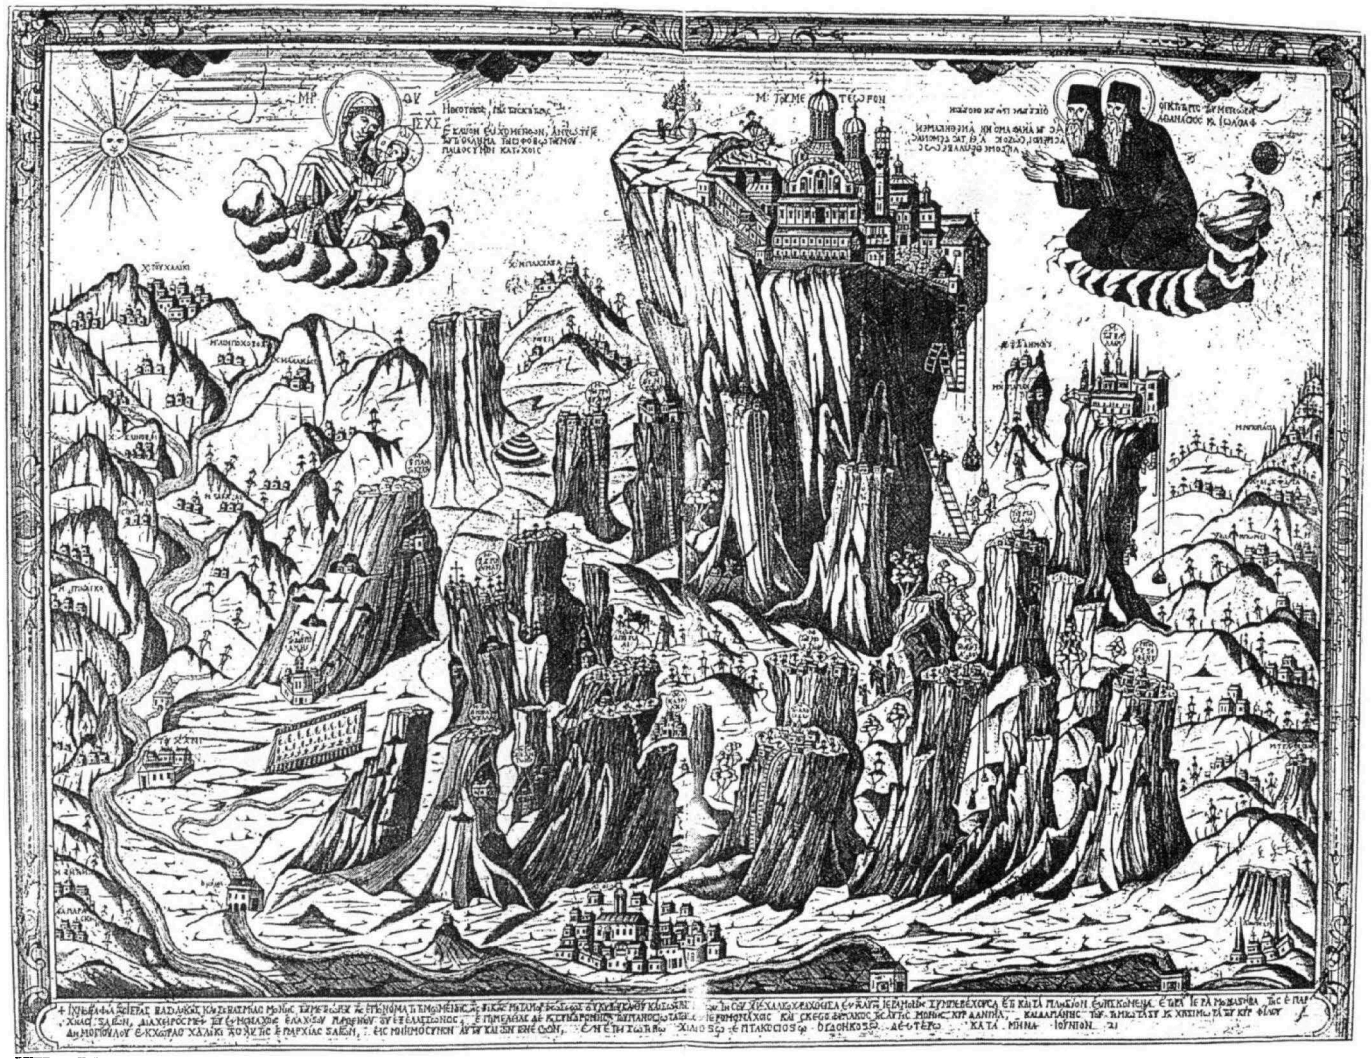
Meteora

A group of monasteries in Thessaly

The monasteries collectively called the Meteora ("raised in the air") are directly north of Kalambaka ("Black Town"), the Classical Aiginion and Byzantine Stagoi, in northwestern Thessaly. From the plain created by the river Peneus there rises, over an area of approximately 2.5 sq km and enclosing a curving valley, a jungle of striated and pitted iron-grey monoliths, up to 275 m high, created by erosion and consisting of a polymictic conglomerate of plutonic and regional metamorphic rocks. Unmentioned in Classical literature (apart from a possible allusion in Homer, *Iliad*, 2. 729), this most spectacular geological feature of Greece has from the 18th century awed foreign visitors, including Edward Lear who sketched one of its monasteries (Barlaam).

Its monastic history cannot be traced before the 14th century, and is based largely upon documents most of which were discovered in its own libraries. Principal among these are the *Lives* and *Testaments* of the founders of three of the monasteries; the *Historical Discourse*, written perhaps in 1521 to contest the claim to supremacy of the Great Meteoron monastery; and the *Chronicle of Ioannina* (known also from elsewhere) of *c.*1440, which details the Serbian empire in Thessaly. It is not known how many monasteries there were at any one time or even in total: the *Historical Discourse* gives 14, a mid-17th-century list names 19, while oral tradition reports at least 24, but some of these were undoubtedly merely eremitic communities dependent upon a regular monastery.

The earliest known monks were anchorites forming what they called the "Thebaid of Stagoi" after the heartland of Egyptian monasticism. They lived in the shallow caves of a large rock known as Doupiani (from Serbian *dupljane* or Bulgarian *dupljak* meaning "cavity"), and were under the supervision of a *protos* ("first" monk) rather than an abbot.



Meteora: woodcut showing the monasteries of Meteora

They gathered for a communal liturgy every Sunday below the rock at a tiny basilical church which was rebuilt in 1861. By sometime before 1336, however, there was also a small monastery built in one of the bigger caves, for a *chrysobull* (imperial charter) issued in that year by the Byzantine emperor Andronikos III Palaiologos (the text is painted on a wall of the cathedral church at Stagoi) in quoting from an earlier *praktikon* (inventory) refers to a small dependent monastery of the bishopric called the Theotokos of Doupiani.

Protection in those tumultuous times was given to the fledgeling community by the pious "Emperor of the Serbs and Greeks of Thessaly", Symeon Uroš Nemanjić Palaiologos (1359–71?), whose spiritual adviser was the *protos* Neilos. Neilos expanded his skete and built four small churches, of which only one can be located today, the Hypapanti (Presentation) in a cave halfway up a cliff to the northeast of Doupiani. Sometime later, monastic cells were added in an adjoining cave linked to the first by a short tunnel. Neilos is himself depicted in a fresco in the church kneeling at the Virgin's feet.

The move at the Meteora from troglodytic eremiticism to cenobitic monasticism was largely due, despite his reluctance, to the hesychast Athanasios. Notwithstanding his occupation of caves high up on the precipitous sides of the massive rock known as the *Platys Lithos* (Broad Rock), his holiness enticed disciples to join him and this forced him to the top of the rock to accommodate them all. There he built a church and wrote a typikon (charter) for the community, which after his death in 1383 came into the care of the monastery's "second founder", Symeon's son and successor John Uroš, who a decade earlier had become the monk Joasaph (the church contains three portraits of both Athanasios and Joasaph).

The example of the Great Meteoron encouraged other foundations, first in 1390 the now vanished Hypselotera on an even higher monolith, and then about ten years later Hagiou Stephanou, founded by Antonios Kantakouzenos, nephew of Symeon and grandson of the Byzantine emperor John VI. Although the 15th century saw not only external threats from Turkish conquest and occupation but also internal corruption and fraternal power-struggles, a few monasteries continued to be founded, including the surviving Hagiou Nikolaou Anapavsa and Hagias Triados (though both on the sites of earlier eremitic occupation). Around 1490 the diocese of Stagoi came under the jurisdiction of the archbishopric of

Larissa, and the Great Meteoron, soon to be followed by other communities, became self-governing; while in 1540 it, again to be followed by others, was granted stavropegial rank and thus came directly under the authority of the patriarch. The golden age that the monasteries of the Meteora were now able to enjoy was, nevertheless, more due to the settled nature of the reign of the sultan Süleyman I the Magnificent (1520–66), who lifted the ban on eccelesiastical construction. In the absence of Byzantine and Serbian rulers to grant lands and privileges to the monasteries the semi-independent Wallachian and Moldavian *voievozi* filled the breach as the patrons of Orthodoxy, although no Meteoran foundation ever acquired the wealth of the poorest Athonite monastery.

The caves at the Meteora were occupied mainly by anchorites (although one of the largest served as the monastic prison). Most, and with the exception of Hypapanti all of the surviving, monasteries were, however, constructed on precipitous monoliths; but, whereas the Great Meteoron covers about an acre, the small 16th-century Rousanou seems on all sides to be a mere extension of its rock and at Hagiou Nikolaou a slight backward step by a monastic gardener would precipitate him directly to the base of its rock. Entry used to be achieved either by climbing precarious and vertiginous wooden ladders (up to 40 m long), the upper reaches of which the monks drew up at night and in time of peril, or by being hauled up in nets by a rope from a windlass in a projecting tower (in the 1920s to the dismay, and contempt, of many monks bridges were built and steps cut into the rocks on the instructions of Polykarpos, bishop of Trikkala).

The oldest surviving frescos are probably those in the nave of Hypapanti, painted in a lively and popular style of the late Palaiologan period. These contrast with the more formal and at times austere art of the richer monasteries such as the Great Meteoron and its 16th-century neighbour Barlaam. The most famous painter known to have been employed at any of these monasteries was the influential Cretan Theophanes, who worked at Hagiou Nikolaou Anapavsa in 1527.

The fortunes of the Meteora declined drastically during the 18th and early 19th centuries and were never to recover (in 1899, 18 years after the cession of Thessaly to Greece, even their independence was lost to the bishop at Trikkala). The Phanariot rulers of the Romanian principalities proved far less interested than their indigenous predecessors in giving support, and, more serious, the stirrings of Greek independence led to both unrest and retaliation from the Turks which was often directed against hapless monks, while the virtually independent Ali Pasha of Ioannina imposed crippling taxes. Moreover, the very inaccessibility of these monasteries, which had in part protected them from the depredations suffered by other foundations (some of which had even sent relics and other valuables to the Meteora for safe keeping), became itself the cause of serious damage during not only the Greek War of Independence, but also World War II and the ensuing Civil War, when bands of klephts, partisans, and communists respectively made them their headquarters. Hagiou Dimitriou was completely destroyed in 1809 by Turkish firepower, while Italian troops looted Barlaam in 1943 and German troops shelled and looted Hagiou Stephanou and Hagias Triados. Subsequently the Greek government embarked on a programme not only to repair the shattered buildings but also to restore the frescos and protect the libraries and treasures.

Nevertheless, the construction of a metalled road further weakened the precarious monastic hold on the Meteora by giving numerous tourists access by charabanc to all the surviving monasteries except Hypapanti. Many monks fled to the comparative quietude of Athos and elsewhere, while the determination of those few willing to test their ability to maintain an inward peace proof against external turbulence (Hagias Triados was even used for the James Bond film *For Your Eyes Only*) rarely lasted long. Although the Church has attempted with some success to maintain a presence, occupation of individual monasteries by small groups of both monks and nuns (and occasionally by a solitary monk) has been fitful: even Hypapanti, rarely found by a tourist, has been abandoned, although for a brief time in the early 1970s it was home to two monks from the Great Meteoron.

A.R. LITTLEWOOD

Summary

A group of monasteries in northwestern Thessaly, the Meteora ("raised in the air") occupy a spectacular geological setting. Their history dates from the 14th century when monks were fleeing Athonite monasteries which were under attack. The Meteora flourished in the 16th century but declined in the 18th and 19th. A metalled road in the 20th century facilitated access to the monasteries, since when most of the monks have departed to Athos.

Methodios, St *c.*815–885

Missionary to the Slavs

St Methodios was, together with his younger brother St Cyril, the inventor of the Slavonic Glagolitic alphabet and a prominent Byzantine missionary. St Methodios cuts a less conspicuous profile than St Cyril, but his superb qualities as an administrator and organizer secured to a large extent the successful introduction of the Slavonic liturgy and writing.

Born in the city of Thessalonica, St Methodios must have been well educated with good connections at the court in Constantinople, since we first find him as an imperial governor of a Slav-inhabited territory in Macedonia. Later he renounced the world and became the abbot of a monastery on Mount Olympus in Asia Minor, which was, at that time, the most important centre of Byzantine monasticism. Methodios seems

to have been constantly in contact with Cyril, who joined him in the monastery for a period after his Arab mission (851 or 855–56). He appears to have accompanied Cyril on his journey to the Khazar court (860–61). The learned patriarch Photios and the emperor Michael III (843–67) sent both brothers on the Moravian mission, where they worked together on the organization of a Slavonic Church.

The individual achievements of SS Cyril and Methodios in Moravia (862–69) are very hard to distinguish. Methodios was active not only in Moravia, but also in Pannonia in the Slavic principality of prince Kocel. In any case, Methodios emerged into the forefront as the leader of the mission after the death of Cyril in Rome in 869. After pope Hadrian II (867–72) had given his blessing for the Slavonic liturgy and writing, he appointed Methodios papal legate to the Slavs and ordained him archbishop of the revived diocese of Sirmium with jurisdiction over both Moravia and Pannonia. Methodios had to face, however, the renewed opposition of the Frankish clergy in Moravia, where prince Rastislav's nephew prince Svatopluk (870–96) had usurped power with the help of Louis the German (817–76). Captured by the Frankish bishops and accused of heresy at the court of Louis the German, Methodios was kept in prison for three years (870–73). Freed upon the insistence of pope John VIII (872–82), he worked during the next 12 years to build up the Slavonic Church in central Europe. He managed to educate around 200 disciples, and the Slavonic liturgical and literary tradition penetrated Bohemia, Croatia, and perhaps even southern Poland. Still Methodios continued to infringe on the interests of the Frankish clergy and nobility. A doctrinal point of conflict was added in the clash concerning the issue of the *filioque*, i.e. the procession of the Holy Spirit from both the Father and the Son, an innovation to the Nicene Creed supported by the Franks but not by the papacy at that time. During the second journey of Methodios to Rome in 880, pope John VIII confirmed his orthodoxy and declared his endorsement of the vernacular Slavic liturgy. In the next year Methodios went back to Constantinople, where patriarch Photios and the new emperor Basil I (867–86) gave their renewed support to the Moravian mission. In 885 Methodios died in Moravia; soon thereafter prince Svatopluk, influenced by his Frankish advisers, imprisoned his principal disciples and sold them into slavery. The Moravian mission failed in the country in which it was originally meant to succeed. The state of Moravia itself fell under the onslaught of the Hungarians in the early 10th century.

Still, the years 873–85 were the most productive period of the Moravian mission. St Methodios, who outlived his brother by 16 years, was responsible for a significant expansion in the number of translations from Greek into Old Church Slavonic. According to his Slavonic *Life*, composed most likely by his disciple Kliment of Ohrid, Methodios completed the translation of the entire Bible into Slavonic. This first Slavonic translation of the Bible has not been preserved. Other translations attributed to Methodios include the *nomokanon* (a Byzantine manual of canon law and imperial edicts concerning the Church), patristic books, and a service in honour of St Demetrius, the patron of his native city of Thessalonica. The *Life* credits him also with the conversion of the pagan Slavs from southern Poland.

St Methodios was a bridge between Byzantium and the West in a period when the unity between eastern and western Christendom was endangered by the Photian schism (863–70) and by missionary competition over the proselytization of the Slavs. In this difficult period Methodios won the approval of both Rome and Constantinople for the establishment of a Slavonic Church in Moravia. Doubtless the resolution of the Photian schism in the Constantinopolitan councils of 869–70 and 879–80 also played a role in acquiring the combined support of Rome and Constantinople for his work. A first-rate diplomat, organizer, and teacher, Methodios succeeded in preparing a number of disciples who were able to continue successfully the introduction of Slavonic vernacular liturgy and writing. After his death in 885, the Slavic Church of Moravia no longer enjoyed the favour of the papacy and of prince Svatopluk, but his disciples succeeded in carrying on the tradition of Methodios in Bulgaria, and hence in Serbia and Russia. The first Christian king of Bulgaria, Boris (852–93), received with honour in 885–86 three of his disciples – Kliment of Ohrid, Naum of Preslav, and Angelarios. They were entrusted with replacing the Greek liturgy with one written in Old Church Slavonic, but still based on Byzantine liturgical practices. Byzantium itself interfered to save the work of the "Apostles the Slavs". When Methodios visited Constantinople in 881, the patriarch Photios retained two of his students and Slavonic liturgical books for the purpose of future missionary activities. Thus, having initiated the Moravian mission, Byzantium also played a crucial role by saving its fruits and disseminating them among the Slavs.

DIMITER G. ANGELOV

Biography

Born in Thessalonica *c.*815, St Methodios was governor of a territory in Macedonia. Then he became a monk and later abbot of a monastery on Mount Olympus. With his brother St Cyril he was sent on a mission to Moravia to organize a Slavonic Church. They invented the Glagolitic alphabet and translated the Bible and other texts into Old Church Slavonic. He died in 885.

Metics

Resident aliens

The word *metoikoi* in ancient Greek literally means "co-inhabitants" and was used to define the foreigners resident in an ancient city state, who had a special status and special rights in contrast to the citizens (and also in contrast to the foreigners who were only travelling through and had no rights at all). Metics existed in every Greek town (under different names, e.g. *epoikoi* or *synoikoi*), but what is known about the term is mainly shaped by the evidence from ancient Athens. There especially (though not exclusively) the development of such a status of "resident aliens" seems to have been conditioned by two factors: on the one hand, the frequency of immigration (Athens was a magnet for foreign merchants and artisans in Classical times), and on the other, the pride of native Athenian citizens who refused easy access to full citizenship. This is already reflected in Solon's law about the exceptional admission of foreigners into the citizen body (Plutarch, *Solon*, 24. 4), thereby favouring the emergence of a class of "second-class citizens".

Metics were free people, but had lesser rights than citizens; their group was made up not only by foreigners migrating from other cities (or countries, non-Greek ones included) but also by former slaves who had been set free by their masters. In the former case, they had to be registered a certain time (probably a month) after their arrival and to pay the *metoikion*, a poll tax (which was not levied on citizens), as well as some other taxes imposed on foreigners and a special fee if they wanted to deal in the Agora. (If they failed to pay the *metoikion*, they could be sold into slavery.) Metics had to be enlisted in an Attic deme (local community or village) to acquire the right to dwell there (in inscriptions this is indicated by the expression "living in ... " behind the metic's name); in many cases this was Piraeus, the centre of Athenian commercial activity. Although metics enjoyed full control over their portable possessions, they were not allowed to acquire land or buy a house in Athens; therefore numerous metics put their skills into trade and crafts; the world of money transactions was largely dominated by them as well. Metics could attain *isoteleia*, i.e. citizen-like status with respect to financial duties to the polis; in court, however, a so-called *prostates* (a citizen acting as guardian) had to represent them. Metics had a clearly defined role in the city's great festivals: they had a fixed position in the procession of the Panathenaea, and they could even function as a choregus (i.e. a sponsor) at the Lenaea, but not at the Great Dionysia. Moreover, they had to do military service, usually in the infantry. On the whole, metics had no political rights and almost never a possibility to acquire full citizen status, because that status could only be conveyed by birth, and the rigid citizenship law of Pericles of 451/50 BC even required Athenian descent on both paternal and maternal sides. Exceptionally, though, the Athenian people's assembly (*ekklesia*) could bestow citizenship on foreigners for outstanding merits.

It is not clear how many metics lived in Athens (as also the exact number of the whole Athenian population is still a very controversial subject); a population count in the late 4th century – reported from the census of Demetrius of Phalerum probably in 317 BC – suggests that there were about 10,000 metics and 21,000 citizens. The Athenians were not always very well disposed towards the metics – they seem to have been made fun of in several comedies the titles of which are preserved – probably because there were many former slaves from "barbarian" countries among them; still, because of their commercial activities and their military service they were absolutely indispensable for the Athenian state, and in fact the barbarians among them were probably the best fitted for long-distance commerce (e. g. the grain trade with the Black Sea region), because they were acquainted with these areas. In the middle of the 4th century Xenophon (*De Vectigalibus*, 2. 6) even proposed to give more rights to the metics, arguing that their activities in Athens would enhance the prosperity of the city. Numerous metics seem to have become rich (especially famous are the wealthy bankers Pasion and Phormion), and they also used their means to cultivate their native religions: the cult of the Thracian goddess Bendis was officially established in Athens already in 429/28 BC, and there is evidence for about 15 foreign cults (e.g. of Egyptian, Carian, Phrygian, Syrian, and Phoenician gods and goddesses) in Piraeus; moreover there are sumptuous grave stelae with bilingual inscriptions of Phoenician metics. (An alleged common cult of "Metoikios Zeus", however, seems to be only a fancy of the late lexicographer Phrynichus.)

The status of the metics began to lose its distinctive features in the 4th century BC, when they were allowed to act in court on their own (without a *prostates*), and came to an end in Hellenistic times, when the purchase of citizenship became very frequent (probably because the law of Pericles lost much of its importance in the 3rd century, as also did the decisions of the *ekklesia*). In this period, even foreigners staying only a short time in Athens could occasionally get the status of metics, but without having to pay the concomitant taxes.

In Hellenistic and Roman times, free people living on the territory of a polis without being citizens were called *paroikoi*, in Asia Minor also *katoikoi*.

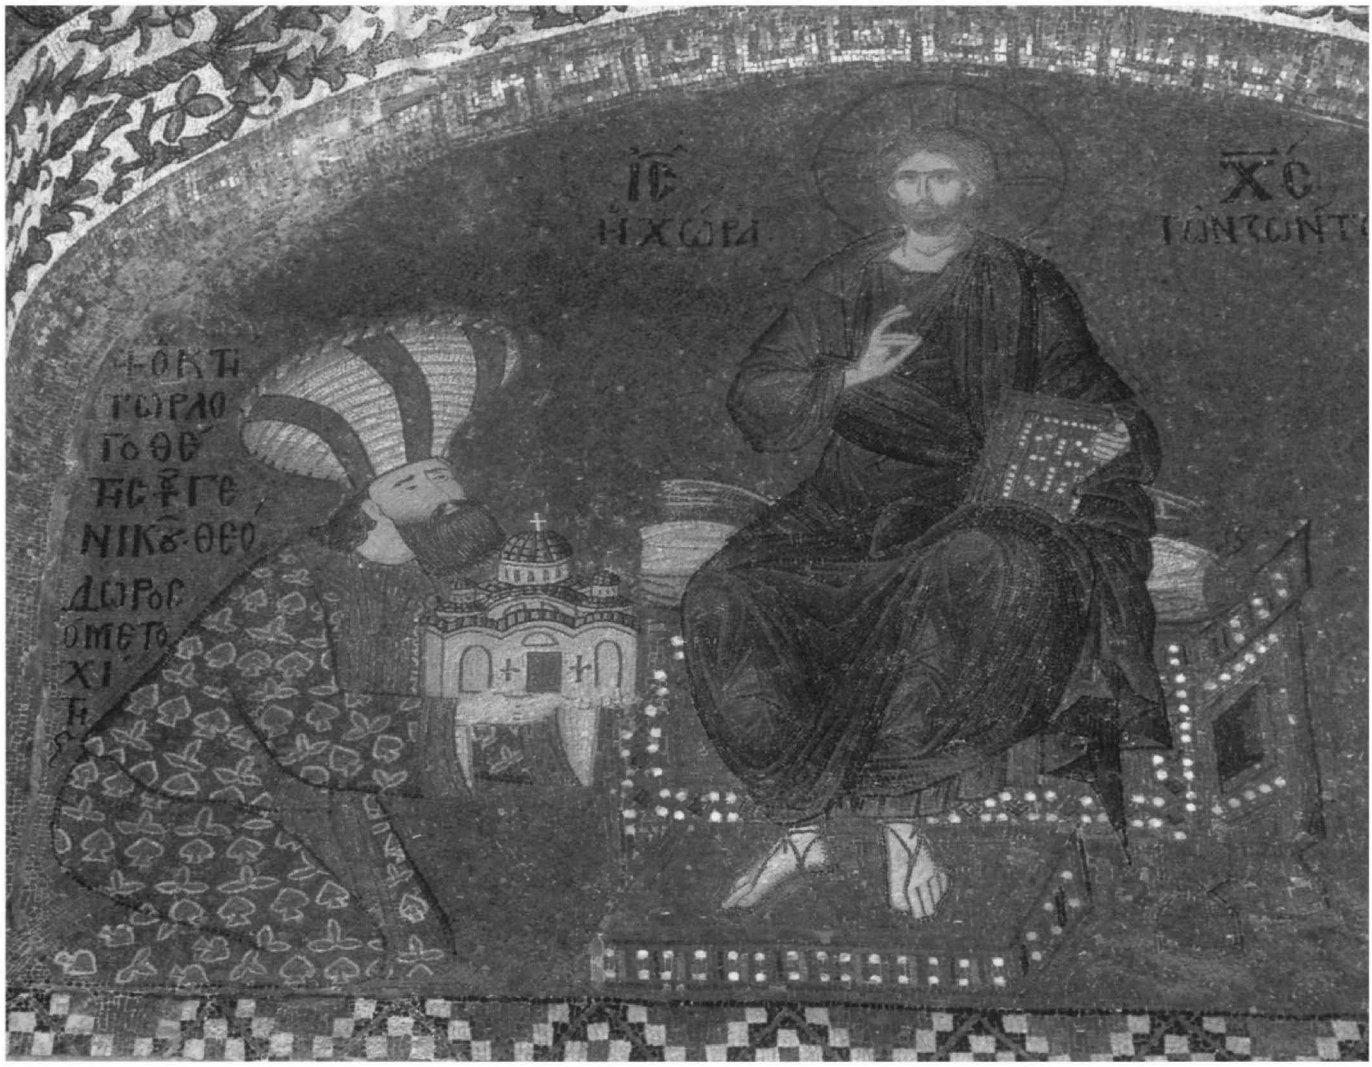
Metochites, Theodore 1270–1332

Statesman and scholar

Theodore Metochites distinguished himself both as a statesman and as a scholar. He was the son of George Metochites, the archdeacon of Constantinople, who supported the union of the Churches and, for that reason, in 1283 was sent with his family into exile in Asia Minor. Despite such hardship, Theodore acquired a formidable education and, when Andronikos II visited Nicaea in 1290, his extensive learning and skills impressed the emperor greatly. He became a member of the imperial court, was sent as an ambassador to Cyprus, Cilicia, and Serbia, and was appointed *logothetes ton angelon* (supervisor of the state herds of horses and mules), *logothetes ton oikeiakon* (supervisor of the household), *logothetes tou genikou* (supervisor of the fisc), *mesazon* (chief imperial minister), and finally *megas logothetes* (prime minister). But in 1328 Andronikos II was dethroned, and Metochites was imprisoned and sent into exile in Didymoteichon. In 1330 he was allowed to return to Constantinople, where he died as the monk Theoleptos in the monastery of Chora.

Theodore Metochites is representative of the humanism of the Palaiologan renaissance. Although burdened with administrative responsibilities, he devoted himself to the study of philosophy and literature. In addition, at an advanced age he studied astronomy with Manuel Bryennios, the author of an



Theodore Metochites: mosaic in the church of St Saviour in Chora, Constantinople, showing Metochites presenting the restored church to Christ, *c.*1330

extant treatise on musical theory. He was an avid collector of books and spent much time comparing manuscripts. He donated his library to the Chora monastery, and he was also responsible for the redecoration of its church with new mosaics and frescos, which are perhaps the greatest achievement of late Byzantine art. He had a group of pupils, of whom the most illustrious was the astronomer and historian Nikephoros Gregoras.

Metochites's main work is a collection of essays, notes, and annotations, the *Miscellanea Philosophica et Historica Graece.* Many of these essays discuss issues concerning Classical authors, for example, the obscurity of Aristotle's style, the development of ancient mathematics, Plutarch, Xenophon, and Philo. He also wrote paraphrases of Aristotle's works on natural philosophy, and an introduction to astronomy based in all essentials on Ptolemy. In his treatise *Ethikos* (On Education), as well as in his essay comparing Demosthenes with Aristides, he comments on the importance of education, the role of the scholars of his time, and the differences between the contemplative and the active life. More specifically, he stresses the importance of the active life, which in his view was devalued by the ancient philosophers as inferior to the contemplative life, and he attempts to dissociate the latter from any kind of mysticism that advocates the union of the human psyche to God. Finally, he wrote hexameter poems, rhetorical works, and enkomia.

The long debate between Metochites and his former friend and rival Nikephoros Choumnos marks most of his intellectual career. He was criticized by Choumnos for his obscure style, and he defended himself by arguing that Thucydides perhaps was stylistically the most unattractive of all the Classical authors, though he was at the same time one of the greatest. But the centre of the dispute concerned their different views on astronomy. Choumnos accused Metochites of abandoning Plato's theory about the seven revolutions and endorsing Ptolemy's views on the eight celestial spheres. Since there was a difference between Ptolemy and his predecessors concerning the number of the spheres, Metochites decided to remove the discrepancy and harmonize Ptolemy with Plato by altering the Platonic text in some places.

Yet whatever reservations one may have about Metochites as an astronomer, it is important to note that he regarded astronomy as a science, and he saw no conflict between science and religious belief. In fact, there is no doubt that he regarded astronomy, and the mathematical sciences in general, as the supreme sciences. He thus gave great importance to the study of mathematics, and was influenced by Plato's philosophy of mathematics, though it seems that his knowledge of Plato was most probably indirect, through the writings of Iamblichus and Nicomachus. He claimed that the mathematical sciences are superior to physics, because they constitute a source of tranquillity for the soul since their conclusions are indisputable, whereas physical sciences give rise to disputes in their attempt to understand physical phenomena. In his attitude towards Aristotle, Metochites, like many Byzantine scholars, was rather ambivalent. On the one hand, he was obviously an admirer of Aristotle's logic and physics, on the other he believed that Aristotle had included in his *Metaphysics* so many contradictions and ambiguities that it would have been much better if this work had never been written.

KATERINA IERODIAKONOU

Biography

Born in 1270 the son of George Metochites, archdeacon of Constantinople, he followed his family into exile in Asia Minor in 1283. Still he got a good education and attracted the attention of Andronikos II. He had a distinguished career at the imperial court until Andronikos was dethroned in 1328. Metochites was exiled, but allowed to return in 1330. As a scholar he studied philosophy and literature. He died a monk in Constantinople in 1332.

Miaoulis, Andreas 1769–1835

Naval hero of the Greek War of Independence

Andreas Miaoulis was born Andreas Vokos on the island of Hydra on 20 May 1769. He came from a wealthy family of merchants and ship masters. Following the family tradition, Andreas took to sea at a young age and quickly gained notoriety as a marauder, who sailed as far as Malta, southern France, and Syria in pursuit of booty. Legend has it that Andreas and his raiders once sailed up the Nile as far as Cairo. Later, a clash with Maltese buccaneers off the southern coast of the Peloponnese resulted in the sinking of Andreas's ship and his unceremonious return home. But, determined not to surrender to the whims of fortune, he soon embarked again, this time in command of his own ship, a Turkish brig named *Miaoul*, which had been purchased with the proceeds of his successful grain-trading ventures in the Aegean islands. In time, he became known as "Miaoulis", a name that was to become deeply feared by his Turkish enemies.

By the time of the outbreak of the Greek revolution in 1821, the 52-year-old Miaoulis was one of the most respected figures on Hydra. He had practically retired from the sea and was leading a comfortable life as a wealthy sea merchant. A man of conservative habits in his private life, Miaoulis remained nevertheless a fervent enemy of Ottoman rule. He was thus immediately seen as an obvious choice to assume command of the revolution's naval forces. By the end of 1821 Miaoulis was formally named admiral of Hydra by the leaders of the island and was quietly recognized as the revolution's chief of naval operations.

With ships from his own island as well as those of Spetsai and Psara, Miaoulis sought to keep the superior, but cumbersome, Turkish fleet off balance. However, the destruction of the island of Chios and the massacre of its population by the

Turks in mid-1822 brought Miaoulis into the eastern Aegean to seek a decisive engagement with the enemy. Recognizing that the Greek fleet could not sustain a head-on collision with the Turkish fleet, a war council in Psara decided to strike the Turks with fireships. The attack led to the sinking of the Turkish flagship by the Psara fireship commander, Constantine Kanaris, and registered the first major victory at sea for the revolution.

In the following years Miaoulis's naval strategy faced two imperatives. On the one hand, he needed to disrupt the enemy's transportation of troops and supplies to suppress the revolution on the mainland. On the other hand, the Greek naval forces had to engage in what would be recognized today as "limited sea denial" in an effort to protect the main Greek islands and cause as much damage to enemy naval forces as possible. When Psara was destroyed and its people put to the sword by a Turkish landing in 1824, Miaoulis returned to the island and surprised and sank 20 enemy gunboats. He then turned to defending the much bigger island of Samos, which the Turks wished to make into another example of the horrors awaiting those who revolted against the Porte. In a series of engagements against the numerically superior Turkish squadrons, culminating in the Battle of Gerondas, Miaoulis defeated the Turkish attempt to land on Samos and forced the enemy to retreat.

Beginning in 1825, Miaoulis concentrated his slim forces on battling a fearsome invasion of the Peloponnese by the Egyptian Ibrahim Pasha. Ibrahim's invasion was carried out with extreme brutality, causing the near extinction of the revolution. Miaoulis deployed his slim forces in an unequal battle to disrupt Ibrahim's sea lines of communication with Egypt and to sink as many troop ships as possible. In September 1825 he surprised an Egyptian squadron in the harbour of Methoni and burnt 28 of its ships. In January 1826 he joined the desperate effort to resupply with food and essentials the heroic city of Missolongi in western Greece, which was under siege by Ibrahim's army. During the Battle of Cavo Papa (28 January 1826) he engaged the Turkish fleet with an inferior force, but he did not hesitate to manoeuvre aggressively, facing the enemy ships of the line and then exchanging fierce cannon fire with them for more than three hours. As a result, the Turks hastily retreated to the safe haven of Patras harbour.

In 1827, with the Great Powers taking an increasing interest in the Greek struggle, Miaoulis, despite his undisputed position as naval leader of the revolution, immediately agreed to serve under a British admiral as a simple captain. The historic Battle of Navarino (October 1827), where Ibrahim's fleet was destroyed by a combined British, French, and Russian force, broke the Ottoman grip on Greece and led to the founding of the modern Greek state. The first governor of Greece, Ioannis Kapodistria, reappointed Miaoulis as chief of the Greek navy and ordered him to pursue the pirates plaguing Greek seas. However, Miaoulis sympathized with those war veterans who opposed Kapodistria's administration, which they found arbitrary and autocratic. With his home island of Hydra up in arms against the governor, Miaoulis himself staged a naval mutiny at the Poros naval station in the summer of 1831. The rising was quickly subdued by the cannons of a Russian squadron, but not before Miaoulis had scuttled two ships of the line and escaped to Hydra.

Kapodistria's assassination brought an end to plans of prosecuting Miaoulis for the Poros mutiny and, in 1832, the revolutionary hero was put in charge of the Greek delegation that went to Bavaria to offer the Hellenic crown to prince Otto. Upon the arrival of the new king in 1833, Miaoulis was appointed chief of the royal navy. In 1834 he was the first naval officer of the new Greek state to be promoted to the rank of rear-admiral and appointed inspector general of the fleet. The following year he was awarded the title of state councillor. He died in Athens in June 1835 from respiratory complications stemming from tuberculosis.

Andreas Miaoulis, a man of only the most rudimentary education, was recognized by his contemporaries as a master naval planner and strategist. His grasp of the broader tactical implications of naval action, his steady command under fire, and his ability to move his crews into action under the most dire adversities were legendary, among both his countrymen and the foreign officers who were sent to support the Greek cause. Miaoulis never blinked. Legend has it that once during the Napoleonic wars the young Miaoulis was captured by an English man-of-war while trying to run the British blockade in Spanish waters. He was then taken directly to admiral Horatio Nelson, who proceeded to interrogate the young captive in broken Spanish. "Why are you breaking the blockade?", Nelson asked. "Because it is to my profit", Miaoulis answered. And what would have happened, Nelson enquired, if he had commanded that smuggler's vessel, and Miaoulis had captured him? "I would have hanged you by your neck from the yard arm", Miaoulis coolly retorted. He was then ordered to be freed by Nelson, who congratulated him on both his bravery and his candour.

ANESTIS T. SYMEONIDES

Biography

Born in 1769 on the island of Hydra, the son of Andreas Vokos, he came from a wealthy merchant family but received only rudimentary education. Going early to sea, he became known as Miaoulis after taking command of a Turkish ship named *Miaoul*. From 1821 he became naval leader of the Greek revolution. Kapodistria appointed him chief of the navy, a position he retained until his death in 1835.

Michael of Ephesus

Scholar of the 12th century

Michael of Ephesus was most probably a member of the circle of scholars around Anna Komnene that contributed greatly to the revival of Aristotelianism in the 12th century. When Anna Komnene retired from court in 1118 to a convent in Constantinople, and before she started writing her history in 1138/39, she charged a group of Byzantine scholars, among them Michael of Ephesus and Eustratios of Nicaea, with the task of writing commentaries on Aristotle. Michael of Ephesus composed detailed commentaries on many of Aristotle's works, and he later complained that his eyesight was spoiled because he had to work through the night to comply with Anna Komnene's wishes. However, most facts about his life are obscure and thus still disputed, for example the date of his birth, or whether he had been a student of Michael Psellos.

Several of his commentaries are still extant: on the *Sophistici Elenchi*, which was wrongly attributed to Alexander of Aphrodisias; on the *Ethica Nicomachea*; on the *Parva Naturalia*; on the *De Generatione Animalium*, which was wrongly attributed to Philoponus; on the *De Partibus Animalium*, the *De Animalium Motione*, and the *De Animalium Incessu*; on the *Metaphysica E–N*, which was also wrongly attributed to Alexander of Aphrodisias; and on the *Politica*. But there are also commentaries by him that are still unedited, for example his commentary on the pseudo-Aristotelian treatise *De Coloribus*. Others that are either completely lost or only fragmentarily extant in the mass of the surviving, often anonymous, scholia, include his commentaries on the *Topica*, the *Analytica Priora*, the *De Caelo*, the *Physica*, and the *Rhetorica*.

Michael of Ephesus's interpretations of Aristotelian passages are generally clear and sensible, never disputing Aristotle's authority. Among his comments, there are few genuinely new ones; most are taken from previous commentators, such as Alexander of Aphrodisias. But even if they are not always his own, his comments are sober and helpful especially in those cases in which no other commentary has survived. His commentaries not only shed light on Aristotle's thought and provide otherwise lost information concerning the history of philosophy, but they are also of interest from a historian's point of view, since they sometimes contain references to the contemporary political situation, for example criticism of the emperor and discussions about the contemporary educational system. As to his style, it often betrays the fact that such commentaries were actually used for oral teaching.

Though not particularly original, Michael of Ephesus was very influential. There is no doubt that all later Byzantine scholiasts looked to him when they wanted to write scholia, and even his very words appear quite frequently in the commentaries and paraphrases from the 13th to the 15th centuries.

KATERINA IERODIAKONOU

Biography

Next to nothing is known of the life of Michael of Ephesus. He was probably one of the group of scholars associated with Anna Komnene that contributed to the revival of Aristotelianism in the 12th century. He wrote commentaries on many of Aristotle's works, of which several survive.

Michael VIII Palaiologos *c.*1225–1282

Emperor

Michael VIII (1259–82) was the eldest of three sons in a long-established family of Byzantium's military nobility. His father, Andronikos Palaiologos, held the office of Grand Domestic (*Megas Domestikos*), the highest military command, in the Laskarid government-in-exile of Nicaea during the Latin occupation of Constantinople.

Michael at first attracted the attention and favour of the second Nicene emperor, John III Vatatzes (1221–54). But in the autumn of 1253 he was accused of treasonous dealings and, despite his evasion of punishment, remained under suspicion thereafter. Married to John II's grandniece, and holding important military posts, he was again held in suspicion by the new emperor, Theodore II Laskaris (1254–58), who had a paranoid hatred of the nobility. In 1256 Michael actually fled to the Seljuk Turkish sultan, whom he served briefly in military command. Allowed back to the Byzantine court in early 1258, he faced wild alternations of disgrace and reconciliation until Theodore's premature death (August 1258). Theodore's son and successor was a boy only 8 years old, John IV Laskaris. Designated as regent and guardian was Theodore's close friend and adviser, George Mouzalon, who was of low birth and universally hated. Michael skilfully manipulated the situation and, within a few weeks, instigated the brutal murder of Mouzalon and his relatives. Choice of the new regent and guardian of the young emperor logically fell to Michael, who in rapid sequence took the titles first of grand duke (*Megas Doux*), then of despot (*despotes*, "Master"), which suggested rights of succession, and finally that of emperor. In early January 1259 he and his wife were crowned as sovereigns; the boy John Laskaris – whose succession rights had been guaranteed – was given only token recognition.

Through fortune and diligence Michael consolidated his grasp of power. At this time Michael Angelos, the independent Greek lord of Epirus, in northwestern Greece, had made an alliance with Manfred, the Hohenstaufen king of Sicily, and the Latin prince Guillaume II Villehardouin of Achaea, aimed against the Nicene state in general and Michael Palaiologos in particular. Resorting first to diplomacy, Michael contacted the papacy with an offer to reunite the Greek and Latin Churches in exchange for recognition and mediation. This failing, he sent

troops under his brother John. After ravaging Epirus, the Nicene forces met the disorganized allied army and smashed it at the Battle of Pelagonia (summer/autumn 1259).

With the Epirote threat to Nicaea and the future of Latin power in the Byzantine sphere thus doomed, Michael's next goal was the recovery of Constantinople, which had long evaded the sovereigns of Nicaea. Michael made a small and abortive attack on a region of the city in 1260, without effect. The following year he sought to strengthen his naval capacities by negotiating a treaty of alliance with Genoa. By apparent chance, however, a Nicene reconnoitring party, under the general Alexios Strategopoulos, was able to seize Constantinople from its debilitated Latin regime on 25 July 1261. Michael carefully orchestrated the symbolism of this success, making an official entry into the old capital on 15 August, at which time he had himself crowned for a second time. One last, cruel step completed his spectacular vault to power: by the end of 1261 the unhappy John IV Laskaris was decisively removed from any competition by blinding.

As the self-proclaimed "New Constantine", Michael poured out his energies and resources to restore the battered capital and its monuments, repopulating it with Greek ethnic elements from the surrounding region and from the Morea. He repaired the fortifications of the city, and attempted to rebuild a fleet. For Michael, the repossession of Constantinople meant reasserting Byzantium's status as a world power, while it obliged him to continue the recovery of the European territories lost to the Latins after the Fourth Crusade – especially in the Morea, where he strove to expand a Byzantine beach-head he had opened. On both counts he faced the hostility of Latin powers, which eventually received militant focus from the ambitions of the new ruler of Sicily and southern Italy, Charles of Anjou. In May 1267, the year after his destruction of Manfred at Benevento, Charles created by the Treaty of Viterbo an alliance of Michael's enemies committed to his and Byzantium's destruction.

A diplomat of considerable skill, Michael pursued a range of negotiations aimed at forestalling Charles's scheme of conquest. He revived his strongest asset, the proposal to the papacy that the Byzantine Church might be reunited with the Latin Church of Rome. His predecessors, and he himself, had pursued this idea for diplomatic reasons. At length, he negotiated with pope Gregory X (1271–76) an official union (i.e. submission to Rome), accepted by Byzantine negotiators and proclaimed at the Council of Lyons in 1274. That ecclesiastical commitment, as well as Michael's promise to refrain from further attacks on Latin holdings in Greek lands, obliged the pope to restrain Charles, who was also distracted by other Byzantine diplomatic manoeuvrings.

The price of such progress was mounting clerical and popular hostility to Michael at home. He already faced one Church schism as a result of his deposition in 1265 of the patriarch Arsenios, an early supporter who felt betrayed by Michael's treatment of the young John IV. But Michael's union with Rome antagonized a yet larger sector of public opinion, and even members of Michael's own family joined in bitter and disruptive opposition to him.

Michael consequently delayed implementation of the union in his realm. That failure, as well as his relentless prosecution of war against the Latins in Greece, disillusioned the papacy. The strongly pro-Angevin pope Martin IV (1281–85) turned his back on Michael and became party to Charles's new anti-Byzantine coalition, the Treaty of Orvieto (July 1281). Feeling betrayed after he had risked so much at home (and never officially renouncing the union himself), Michael joined a grand conspiracy with the king of Aragon and local dissidents to provoke and exploit the great popular rising known as the Sicilian Vespers (March 1282), which deprived Charles of the foundation of his power and definitively spared Byzantium the threat of his conquest.

While Michael's progress against the Latins in the Morea proved indecisive, he was able to assert ascendancy in the Balkans. In 1264 he reduced his rival, the Epirote despot Michael Angelos, and his descendants to a feeble dependency confirmed by further pressures. The same year witnessed a dangerous inroad into the Balkans by the Tatars of the Golden Horde of southern Russia. This and a second devastating attack in 1271 prompted Michael to negotiate the following year an important treaty with the Mongol khan Nogai, which facilitated an encirclement of Michael's restless Bulgarian neighbours, while Michael's matrimonial ties with the Hungarian crown brought pressure on another dangerous Byzantine neighbour, Serbia. Finally, in 1282, Michael obliged John II Komnenos, emperor of the separatist Greek state of Trebizond, to come to Constantinople and relinquish any remaining claims to the Byzantine imperial title.

By such means Michael gave an image of power and importance to the restored empire of Palaiologan Byzantium, while transferring to the recovered capital the burgeoning cultural revival he had inherited from Laskarid Nicaea. But much of his achievement was illusory. He was unable to drive the Latins out of all the Morea or eliminate other Angelan rivals in Thessaly. His heavy concentration of attention on his western territories and international diplomacy, combined with pro-Laskarid opposition to him in parts of Asia Minor, led him to neglect until virtually the last minute the important eastern lands on which the post-1204 Byzantine recovery had been founded. He left these lands in such weakness that, within a few years, they became easy prey to the nascent power of the Ottoman sultanate. Above all, his arbitrary use of Church union as a diplomatic tool had brought violent controversy to his people and hatred upon himself. When he died suddenly on 11 December 1282, he was denied burial rites by the Church. He left to his hapless son and successor, the mediocre but well-intentioned Andronikos II (1282–1328), the tasks of liquidating the detested union and of adjusting the restored Byzantine empire to its actual status of a minor local power amid the realities of an altered world.

Miletus

City in Ionia

Miletus, situated on the Aegean coast at the mouth of the Maeander river, was one of the great cites of Ionia. Archaeological evidence points to Minoan and Mycenaean settlements on the site. According to Homer, the Milesians were Carians and fought on the Trojan side. Neleus son of Codrus is said to have founded the Ionian settlement.

In the 7th and 6th centuries BC, when the Ionian cities were under pressure first from the Lydians then from the Persians, Miletus took a lead in colonization, founding settlements on the Bosporus and all round the Black Sea: notably at Abydus, Cyzicus, Sinope, Amisus, Trapezus, Phasis, Panticapaeum, Olbia, Istrus, and Tomis. Subsequently a remarkable art grew up in mixed Scythian and Greek communities of what is now southern Russia. Milesians also took a leading part in the establishment of the Greek trading settlement at Naucratis in Egypt. Familiarity with Egypt and Egyptians made possible by this Greek oasis in Egypt was to have very great influence on Greek architecture, sculpture, vase painting, and many other aspects of the developing Greek civilization. In the 6th century the Milesians Thales, Anaximander, and Anaximenes started Greek philosophy. Hecataeus was a pioneer in both geography and historiography. He was also one of the leaders of the unsuccessful Ionian revolt against Persian rule (499–494). Miletus was sacked and many of its inhabitants killed, enslaved, or exiled. Between 479 and 412 Miletus was part of the Delian League which became the Athenian empire. Subsequently it was under Persian rule until liberated by Alexander the Great.

Miletus flourished in the Hellenistic period, and the Seleucid kings funded some of the monumental buildings which have been excavated by German archaeologists. Others were built when the city was ruled by the Romans from 129 BC. In AD 51 St Paul preached at Miletus. The city never became a provincial capital. It nevertheless prospered under Roman rule, particularly in the 1st and 2nd centuries AD when some remarkable harbour and market buildings were constructed. However, constant effort was needed to prevent the harbour, that was the source of the city's wealth, from silting up. The site is now 14 km from the sea. Miletus went into decline in the 4th century. Under Justinian I (527–65) Miletus received a new cathedral, the baths were restored, and the harbour dredged. The bishop, who had been a suffragan of Aphrodisias, became an autocephalous archbishop. Latros to the northeast of Miletus became a centre of monasticism. In the late 6th or 7th century a new circuit of walls was built enclosing only part of the old city area, and within this the theatre was later transformed into a citadel. Eventually all occupation beyond the citadel seems to have ceased. Legend made the remains of the theatre into those of a palace, *palatia*, from which Balat, the modern name of the locality is derived.

The great oracular sanctuary of Apollo lies 16 km south of Miletus at Didyma. Founded and administered by the priestly clan of the Branchidae, it was very influential in the 6th century BC. It was refounded by Alexander the Great, and enjoyed another period of great influence in the 2nd and early 3rd centuries AD. It was sometimes consulted on the nature of god and responded in terms of a philosophical syncretism approaching monotheism. The oracle encouraged Diocletian to persecute the Christians. The ruins of the temple (118 × 16 m) are highly impressive.

Miletus seems to have been the setting of the *Milesian Tales* of Aristides, written around 100 BC, a collection of short, lewd, and erotic tales which were translated into Latin and appear to have influenced tales told in Lucian's *Onos* (*Ass*) and Apuleius' *Metamorphoses*, as well as the *Satyricon* of Petronius.

J.H.W.G. LIEBESCHUETZ

Summary

Miletus was an Ionian city at the mouth of the river Maeander on the west coast of Asia Minor. Traces of Minoan and Mycenaean settlements have been found. Miletus played a leading part in colonizing the Bosporus and Black Sea regions and Naucratis in Egypt. Milesians were pioneers in philosophy and geography. Miletus was sacked by Persia for its part in the Ionian revolt (499–494 BC). It prospered under Roman rule but declined in the 4th centuryAD.

Military League

Military leagues played an important role in Greek interstate relations from the late 6th century BC. The creation of a military league was based on the agreement of two (or more) states to fight together (*symmachein*), either for a limited period or for all times. The standard Greek term for such a league is therefore *symmachia*. Participating states were obliged to have "the same friends and enemies". To coordinate warfare, military leagues usually established some sort of political body, such as a *synedrion* (council) or a board of magistrates. The leadership was transferred to the most powerful state, the *hegemon*. Unlike a *symmachia*, an *epimachia* was defensive in character, i.e. it was limited to defensive fighting exclusively.

The earliest – and most lasting – military alliance was the Peloponnesian League. Its origins can be traced back to the mid-6th century BC, when Sparta entered into a series of alliances, starting with Tegea, in which its allies swore to accept Spartan superiority and to expel the Messenians from their respective country. Similar treaties seem to have been concluded with other poleis, most notably Corinth and Sicyon. These alliances were all with Sparta alone, so mutual obliga-

tions did not necessarily exist between the allies. This bilateral system, reflected in its designation "the Spartans and their allies", was the nucleus of the Peloponnesian League proper as inaugurated between 505 and 501 BC, when a league congress was first established. Its main concern was to debate and make decisions (*dogmata*) on confederate wars. All members had an equal vote and enjoyed internal autonomy. Sparta's decision, taken in its own assembly, was equal to that of the allies put together. *Dogmata* of the allies were passed with its approval exclusively. Only the Spartans could summon the congress and were privileged to supply all commanders of league forces. A treaty from the last decades of the 5th century attests the oaths taken at the reception of new members: each ally swore to have the same friends and enemies as the Spartans, to follow them wherever they led, and not to make peace without Sparta's permission. In return, the allies were granted protection against hostile encroachment. In the 5th century the league grew beyond the Peloponnese and adopted several new members, such as Megara, Aegina, and the Boeotian, Phocian, and Locrian Confederacies. Its attraction was increased by anti-Athenian and – as explicitly stated in the Peloponnesian War – anti-democratic resentment among oligarchic states. After Sparta's victory over Athens and its allies in 404, Athens itself was forced to join, though only for a brief period. In the 4th century two major changes in the organization of the league were introduced. By 382 it was agreed that a member state's stipulated contribution in troops might be commuted to a contribution in cash, and that fines were to be levied on the allies that defaulted. The second innovation, brought about after 379, was to divide the league into ten geographically grouped *mere* (districts), which were presumably meant to be roughly equal in number of troops. Despite these reforms, the alliance soon disintegrated after Sparta's defeat in the Battle of Leuctra in 371.

The Delian League (frequently called "Athenian empire", though the degree of Athenian "imperialistic" rule is disputed among scholars) was founded in 478/87 BC to continue warfare against the Persians after their retreat from Greece. Apparently at the request of the founding members, the leadership was transferred to Athens. All members, including Athens, had one vote in the confederate *synedrion*, to determine strategy. From the outset the Athenians provided all the league's officials, such as the ten *hellenotamiai* (treasurers) and the commanders of allied forces, and settled which members had to send ships and which to pay money into the treasury at Delos. The first assessment of tributes (*phoroi*), allegedly 460 talents, was made by Aristides. The league fought a series of successful battles against the Persians (at the Eurymedon *c.*466 BC) and quickly expanded to 200 member states, most of them in the Aegean, on the west and south coast of Asia Minor, in Thrace, and in the Hellespont and Propontis regions. There was soon dissaffection with Athenian leadership, however. Many states tried to secede (starting with Naxos *c.*470 and Thasos *c.*465), but were forced back in by Athens. After a defeat in Egypt in 454 BC, the treasury was moved from Delos to Athens. One-sixtieth of the allied tribute was thence claimed as an offering to Athena (see the Athenian Tribute Lists in Merritt *et al.*, 1939). Although the alliance had lost its original justification with the removal of its anti-Persian objectives – probably stipulated in the so-called Peace of Callias with Persia in *c.*449 – Athens continued to levy annual *phoroi* and inflicted cleruchies on members who were suspected of revolt (first known at Andros, Lemnos, Naxos, and Carystus in *c.*450). Disloyal states received a harsh punishment (notably Samos *c.*439 and Mytilene *c.*427). The autonomy of the allies was infringed by Athenian decrees on the legislation, jurisdiction, and financial policies of the member states. Epigraphic evidence indicates a shift in the designation from "the Athenians and their allies" to "the cities the Athenians rule". In the early years of the Peloponnesian War, Pericles openly called the Athenian hegemony a tyranny over the allies. The core of the alliance, however, remained remarkably stable throughout the war (despite a massive increase of assessment of allied tributes), which indicates that the league to some degree served the interests of the allies. After its final defeat at Aegospotami, Athens was forced to surrender its fleet and to join the Peloponnesian League. The Athenian empire was dissolved.

A second Athenian Confederacy was established in spring 378 by Athens and the founding members Chios, Byzantium, Rhodes, Mytilene, Methymna, and perhaps Thebes. After an attempted Spartan raid on the Piraeus, the Athenians invited all states to enter the confederacy on the principles laid down in the King's Peace, so "that the Lacedaimonians shall leave the Greeks free and autonomous". Eventually up to 70 members joined. Each state had one vote in the common council at Athens (except the Athenians), who were entrusted with the hegemony, but were not represented in the *synedrion*. The allies were guaranteed autonomy and freedom from tribute. Athenian ownership of land or property in allied states was prohibited, i.e. the Athenians refrained from the system of cleruchies. In practice, the alliance soon deviated from these principles. By 373 BC tributes – called *syntaxeis*, to avoid the term *phoroi* – were collected to meet the costs of campaigning. Probably in 365 BC the practice of cleruchies was revived at Samos (though technically not a member of the league). The integrity of the league was severely threatened by revolts of Rhodes, Chios, Cos, and Byzantium in 357 BC (supported by Mausolus of Caria), which led to the Social War between Athens and its allies. In 355 BC Athens was forced to accept the secession of virtually all significant members, except Euboea and a few northern Aegean islands.

Unlike the partial alliances of Sparta and Athens, several attempts were made to establish a combined military league of – at least theoretically – all Greek states. The scope of a "Hellenic League" was to defend Greece proper against foreign invaders. In autumn 481 BC a Hellenic League was founded at Sparta, to meet the impending invasion by Persia. Its designation, promoted by its members and widespread among historians, is slightly misleading, since the league by no means included all Greeks. The allies agreed to end wars among themselves and to give mutual aid at all times. Each member state elected one *proboulos* (representative) and had an equal vote in the council. Meetings were held in the precinct of Poseidon at Corinth. Since the Spartans had the greatest military strength of land forces, it was agreed that they should exercise the *hegemonia*. Athens, contributing more than half of the fleet, had some claims on the maritime command, but the allies distrusted it. The symmachy fell apart when the Spartans withdrew from the alliance in 478 BC. A second Hellenic League was founded in 340 BC against Philip of Macedon,

mainly on the initiative of Demosthenes. A *synhedrion* was established in March 340 at Athens. The hegemony rested with the Athenians, who were also responsible for the collection of allied *syntaxeis* (tributes). The league was defeated on the battlefield at Chaeronea in 338 BC. In return, Philip summoned the Greeks to Corinth the following summer and united all Greek states (except Sparta) in the so-called League of Corinth. Its constitution, set down by Philip, embodied traditional clauses both of earlier military leagues and of common peace treaties from the 4th century. Each member state had one vote in the *synedrion* and was obliged to send troops according to its population. Philip himself, the league's *hegemon*, presided over the *synedrion*. The allies swore not to change their constitutions and not to revolt against the king, which reveals that the league was designed to consolidate Philip's position after Chaeronea. Its military purpose, sponsored by Philip and propagandistically heralded at Corinth, was to make war against Persia. The concept of a Hellenic League was temporarily revived by Antigonus Monophtalmus and Demetrius Poliorcetes in 302 BC, and finally by Antigonus Doson in 224 BC, envisaged as a league of federal states.

Minerals and other natural resources

A large number of different minerals and other natural resources have been exploited in Greece over the centuries. Those used in antiquity tend to be rather different from those used more recently, which will be treated last. Major metallic ore minerals (gold, copper and tin, silver and lead, iron) exploited in antiquity are discussed elsewhere.

Clay was a very important resource in antiquity – most was used for pottery, but some special types had medicinal uses. To a geologist the term clay applies to both a group of platy minerals, and a rock dominated by these minerals. Clay minerals are commonly formed by a chemical process – weathering of older rocks on the surface, or the action of hot water (200–400°C) associated with volcanism or the emplacement of intrusions. Most deposits of the rock clay are formed by the physical process of erosion of clay-mineral-bearing rock. The liberated clay is then transported and sorted by rivers and finally deposited in a lake or the sea. Many of these clay-rock deposits were exploited directly. However, many clays are mineralogically unsuitable for making pottery as they are too stiff or they do not fire well. Suitable clays were commonly deposited in shallow continental lakes surrounded by vegetation. Eventually accumulation of sediments made the lake so shallow that plants grew abundantly. The plants died but did not decay in the stagnant water and their remains were transformed into lignite, a low-grade coal. Some red pottery clays were also obtained from the *Terra Rosa* soils developed on limestone by washing and settling of the liquid, a treatment that resembles the natural processes.

Alumen is the name given to a natural mineral that was used as a deodorant, as a salve when mixed with honey, and as an emetic when mixed with copper salts. It was also used in dyeing, soldering, and in cloth finishing. It was probably bentonite, a clay produced by the weathering and alteration of volcanic rock, that is common on Melos.

Ochre is a red powdery earth made dominantly of hydrated iron oxide. It was used for cult purposes and as a pigment, but not as a source of iron metal. It can be produced by alteration of iron deposits or by deposition directly from springs. Ochre comprises several different minerals – haematite gives a red colour whereas the iron hydroxides geothite and limonite give yellows and browns. In Palaeolithic times red ochre was extracted on Thasos for cult purposes from one of the largest underground mines in Europe. Another important source of ochre was Moschylos on Lemnos. Lemnian earth was used from antiquity down to the 19th century for its medicinal properties, and is still used locally. It was known to the Romans as Terra Sigillata, or "stamped earth", as it was made into little cakes, stamped with the head of Artemis. Lemnian

earth was deposited from former springs. Rainwater falling on the nearby volcanic tuffs soaked into the rock and broke down the minerals. Iron was thus liberated and dissolved in the water. Where the springs debouched, the iron was oxidized by the air and precipitated as ochre.

Pigments used in frescos were derived from a variety of sources, both organic and inorganic, and artificial and natural. These pigments should not be confused with glazes on fired pottery, which have very different compositions. Black pigments were based either on carbon from charcoal, or on preparations of hydrated manganese oxides which occur in some sedimentary rocks. Two different blue pigments were used. The strongest blue was obtained from imported Egyptian blue. Although dominated by copper compounds, the presence of tin suggests that it may have been prepared from bronze. A much paler grey-blue or purple pigment was derived from the mineral glaucophane, which is found in metamorphic rocks from the Cyclades. A range of red, yellow, and brown pigments were all natural forms of ochre (see above). Haematite also gives a red colour.

The bright yellow mineral sulphur was used for many purposes: the pungent fumes given off when it is burnt were used as a disinfectant and for religious purification; it had many external medical uses and was applied as a poultice; it was also used in wool preparation to make it white and soft. Sulphur occurs as the native element in volcanically active areas. It can be gathered directly from the surface and purified by melting. Sulphur has been mined sporadically on Melos and Nisyros at least since Hellenistic times. Sulphur crystallizes directly from hot volcanic vapours where they leave the ground (fumaroles). These gases are usually dominated by steam and carbon dioxide, but commonly contain small amounts of sulphurous gases which crystallize to form the mineral sulphur on or just beneath the surface. The sulphur in these gases is probably derived largely from the molten rock itself, unlike the water which is generally recycled groundwater. Sulphur does not survive for a long time on the surface as it is easily oxidized to the gas sulphur dioxide or consumed by bacteria and turned into sulphate.

Emery was important as an abrasive to shape marble and other stone. It contains corundum, a hard oxide of aluminium, together with magnetite and other minerals. It is formed by the metamorphism of bauxite layers in limestone (see below). Although it occurs at several places in the Aegean, rarely does the quality match that found on Naxos. In antiquity emery was extracted form a large number of shallow quarries, principally in the eastern part of the island. More recently it was extracted from underground mines and transported by aerial tramways to the coast.

Asbestos was used for making fireproof cloth. That used in Greece is a fibrous form of the serpentine mineral antigorite that crystallizes in veins up to 5 cm wide in the rock serpentinite. The crystals are generally lined up at right angles to the direction of the vein, and form as the vein opens up. The ancient sources were on Mount Ochi northeast of Carystus in Euboea, but the mineral has been exploited recently elsewhere.

Very little metallic zinc was produced in antiquity, but brass, an alloy of copper and zinc, seems to have been known in Greece from about 700 BC. Zinc ore is quite common, often in association with lead and copper ores. The main ores are the sulphide sphalerite or calamine, a mineral produced by alteration of sphalerite on the surface. Metallic zinc was rarely produced because it is volatile at the temperatures necessary for smelting it. The resulting zinc vapour condenses on the sides of the furnace, where most of it is converted to zinc oxide. In some cases the oxide was the desired product as a salve, as recorded by Galen on a visit to Cyprus. Pliny mentions zinc oxide as *lauriotis*, probably after the mines at Laurium. In the 19th century zinc and antimony were produced on Siphnos and Thasos, partly from mines that produced lead and silver in antiquity.

Mercury was known in the Old World from around 1600 BC. It was used for silver and gold plating (gilding) and in the recycling of gold thread from cloth but not apparently for mining gold. Mercury is a volatile metal and it was recovered from the sulphide ore cinnabar by distillation. The main sources in the Aegean were around Smyrna (modern Izmir), where the ore is associated with young volcanic rocks. In Roman times much mercury was produced in Spain.

Obsidian was a rare and important resource in the prehistoric period as it could be readily formed into sharp blades. It is a natural volcanic glass. That used in the eastern Mediterranean for blades mostly came from Melos; further west, Lipari was the main source. Obsidian was used extensively in early times for the manufacture of tools and weapons and fulfilled the same functions as flint (which forms in sedimentary rocks) did in northern Europe. It was not completely displaced by copper or bronze as it was sharper and cheaper than both metals. Only the use of iron finally supplanted obsidian in weapons and tools. However, its use did continue in ornaments and mirrors.

Bitumen (pitch), a natural petroleum product, was used in antiquity for caulking ships and wine barrels, for protecting metals, and for magical and medicinal purposes. It is the residue left where petroleum has seeped up to the surface and the lighter, more volatile components (similar to paraffin/kerosene and petrol/gasoline) have been lost by evaporation. There are natural springs and pools of bitumen near Limni Keri, Zakynthos, that were mentioned by Herodotus. The bedrock here is Paleocene-Oligocene limestone, but the petroleum is probably derived from deeper rocks, perhaps the Cretaceous limestones seen elsewhere in the island. In such sedimentary rocks petroleum forms from plant remains by the action of heat in the absence of oxygen. It is lighter than water and hence tends to migrate upwards through permeable rocks or along faults, unless trapped. Despite the presence of bitumen, economic reserves of petroleum have not yet been found in the region.

Amber was used for jewellery and small items. There are no sources in the Aegean region – all must have been transported overland from the Baltic sea, where it occurs abundantly along the coast. Amber is light and few journeys would be necessary to furnish all the amber found so far.

Recently a number of minerals and rocks have been exploited in the Aegean region. Marble and gypsum continue, of course, to be very important commodities. The aluminium ore bauxite has been mined in the area around Mount Parnassus. It was formed by extreme weathering of limestone when a tropical climate prevailed in Greece 200 to 65 million years ago. The same climate acting on different rocks produced

laterites, rocks rich in iron and nickel. These have been exploited in eastern Boeotia and the ore refined at Larimna. Magnesite is a mineral used in the manufacture of refractory bricks. It formed during metamorphism and has been mined on Lesbos, northern Euboea, and the Chalcidice peninsula. The ancient mining heritage of Melos continues today with the extraction of the clays bentonite and kaolinite, as well as perlite, a volcanic rock that can be expanded to make insulating material. Lignite is a form of low-grade coal that is extensively exploited for the generation of electricity in both Greece and Turkey. Its combustion commonly produces much pollution. Thera (modern Santorini) was formerly the main source of pumice, but now it is mined in Yiali and Melos for use as an abrasive.

Mines and Quarries

The common use of the Greek word *metallon* to describe both a mine (e.g. Xenophon, *De Vectigalibus*, 4. 4) and a quarry (e.g. Strabo, 9. 1. 23) shows that little distinction was made between the two in antiquity. Both types of working were considered to provide resources which were of benefit to the community, either as building material or for financial profit.

Mines

Iron is found in several locations throughout Greece and the Aegean. Some of the more significant workings were in Boeotia and Laconia. It is perhaps no coincidence that the earliest Laconian currency consisted of iron "spits". Strabo (10. 1. 9) recorded the presence of copper and iron mines at Chalcis, on the island of Euboea, though there is little substantive evidence. Iron ore was extracted on Seriphos during the 14th century by the Venetians.

Precious metals were mined at several sites throughout Greece and the islands. Silver was mined on the island of Siphnos from the Bronze Age onwards and a number of workings have been investigated at Hagios Sostis in the northeastern part of the island; some of the ancient workings were identified as early as 1700 by P. de Tournefort. Further investigations in the 19th century and in more recent decades have revealed evidence of slag, litharge, and tuyères. Study of the workings themselves shows that metal chisels and picks were used in the galleries. Carbon samples suggest that some of this activity can be dated to the first half of the 3rd millennium BC. Further evidence of metalworking, though not of mine workings, has been found in the southeast of the island. The mines continued to be productive in the Archaic period; this is attested by the presence of Archaic pottery at Hagios Sostis, and the city felt able to dedicate as a tithe a treasury in the sanctuary of Apollo at Delphi. It was reputed to be the richest treasury at Delphi, on account perhaps of its contents rather than of the sculptural decoration on the outside (Herodotus, 3. 57). Coinage issued during the 5th century BC suggests that the mines continued to be worked after the Archaic period. It seems that the workings eventually went too deep, with the result that the mines were flooded at some point before the 2nd century AD (Pausanias, 10. 11. 2).

Some of the best-investigated silver mines in the Greek world are those located around Laurium in southern Attica. At Velatouri mining activity can be traced back at least to the Early Bronze Age. A particularly rich discovery at Maroneia probably in 483/82 BC provided funds that allowed the Athenians, under Themistocles' guidance, to construct a fleet which was to defend the Greek world in the Battle of Salamis. It seems from inscriptions and other historical records that mining concessions were leased out to individuals. Leases show that some individuals held concessions at more than one location. The system largely depended on slave labour for mining and processing of the ore. Nicias was reported to have had 1000 slaves hired to work in the mines during the late 5th century BC, and Xenophon reported than some 10,000 publicly owned slaves were employed in the mines.

Linked to the mines themselves were a number of processing installations for washing and processing the ore. One of these *ergasteria* (workshops) was the subject of a speech by Demosthenes (37). The *ergasterion* concerned had been acquired by Pantaenetus and employed around 30 slaves. As the money needed to acquire the *ergasterion* had had to be raised on credit, these 30 slaves had to work hard enough for the installation to make at least the 1260 drachmas necessary to pay off the interest on the loan. A series of *ergasteria* have recently been excavated at Agrileza; material suggests that they were in use in the 4th century BC. The level of output from the Laurium mines is hard to estimate and there are few firm figures. The Maroneia mine may have yielded between 50 and 100 talents (the equivalent of 1.3–2.6 tons of silver). The mines themselves were probably abandoned during the Hellenistic period, as by Strabo's day (9. 1. 23) the silver supplies were described as having failed, and indeed the slag heaps were being processed to extract ore.

The output of the Laurium mines may well have been small compared to that of mines in Macedonia and Thrace. Ancient sources hint at the wealth derived from these sources. For example, the gold mine at Dysoron in Macedonia had a daily output in the mid-5th century BC of one talent of silver (Herodotus, 5. 17). Mines controlled by Philip II of Macedon near the later site of Philippi apparently had an annual output in the region of 1000 talents (Diodorus, 16. 8. 6). The source of wealth of individual cities in the region is reflected in the depiction of metal ingots and picks on the coinage. The island of Thasos was also widely exploited by mining and Herodotus (6. 47) was able to observe a mountain which had been ransacked by such activity. Sometime in the 460s BC the

Mines and Quarries: Mons Porphyrites in Egypt, source of the highly prized stone, porphyry

Thasians came into conflict with the Athenians and as a result were forced to hand over control of their mine on the mainland opposite their island (Thucydides, 1. 100. 2). The historian Thucydides himself had control of gold mines in Thrace.

One of the more unusual materials mined in antiquity was miltos on the island of Ceos. It was used for a variety of purposes including medicine and fulling, as well as its more popular use as a wash on the surface of Attic pottery. A number of possible mine workings have been found on the island, including those at Trypospilies. There is a reference to this ore in an inscription from the Acropolis in Athens.

Quarries

Quarries, or *latomeia*, were widespread throughout the Greek world. Often such quarries are linked to building projects in nearby cities or sanctuaries. The extensive quarries of Syracuse were used as a prison for some 7000 Athenian prisoners after the disastrous Sicilian expedition. Some of the earliest examples of marble quarrying have been found at Apollona on Naxos. A number of unfinished male statues (*kouroi*) have been discovered there, including what appears to be a large statue of Dionysus which was never removed from the quarry face. Naxian expertise in working marble during the Archaic period is reflected in their major dedication of a colossal statue, along with a substantial marble base, on the island of Delos. Marble quarries have also been identified on Paros. In the Archaic period marble from the island was transported over long distances, for example for building on the island of Siphnos (Herodotus, 3. 57).

Some of the finest marble in the Greek world came from Attica itself, and in particular from the quarries on Mount Pentelikon and Mount Hymettus, which were celebrated by Strabo (9. 1. 23). Pentelic marble, in particular, was widely used for architecture, sculpture, and inscriptions. Indeed the *metalleis* mentioned among those involved with the Periclean building programme at Athens may have been quarrymen (rather than miners). Study of stones from the Periclean buildings shows that Pentelic marble was used in a wide range of temples including the Parthenon, the Erechtheum, the Hephaesteum, and temple of Athena Nike, as well as public buildings in the Agora such as the stoa of Zeus. In the 4th century BC Pentelic marble was used for part of the Telesterion at Eleusis. Pentelic marble continued to be exported in the Roman period; for example, it has been identified at Cyrene, where it was used in the Antonine period.

The Pentelic quarries seem to have been located on the western and northeastern sides of the mountain, where the existence of some 25 quarries has been located. These were certainly active in the Archaic period, as is suggested by the find of an unfinished *kouros*. It has been estimated that some 400,000 cubic m may have been extracted. Facilities fot removing the stone included the paved road which has been found at the Spelia quarry. The quarries on Hymettus may be linked to activity in the Roman period. These seem to have been located on the northwestern slopes of the mountain and also to have been served by a quarry road. Hymettan marble, with its bluish tinge, was used for the roof tiles of the Hekatompedon on the Acropolis during the Archaic period.

In spite of the quality of the marble from Pentelikon and Hymettus, other buildings in Attica were constructed of locally quarried marble and stone. Indeed it is rare for buildings in Attica to feature stone from quarries more than 4 km distant. For example, the marble for the temple of Poseidon at Sunium was extracted from a quarry in the Agrileza valley just a few kilometres away. In the workings by the cliff tower, cuttings in the quarry suggest that one of the column drums had been

extracted from there. The temple of Nemesis at Rhamnous features marble quarried locally at Hagia Marina.

Attic quarries are occasionally mentioned in inscriptions. For example, one dispute related to the rent on a quarry at the Piraeus in the late 340s BC. Rent from quarries could contribute to the maintenance of cult. For example, the sacrifices at the Asclepieum at the Piraeus were paid for by the rental of the quarry, and at Eleusis quarrymen in 332/31 BC made payments to the cult of Heracles in Akris.

Black limestone from near Eleusis was used on the Erechtheum and the Propylaea. Local limestones (poros) were used for public buildings in the Agora such as the Old Bouleuterion, as well as for building projects at Brauron and the Amphiareion. Imported stones in Attica include Aeginetan stone that was used on the Erechtheum and the Hephaesteum, and Parian marble for the Hephaesteum. At Eleusis stones were imported from the Piraeus, Steiria, and Aegina, suggesting the relative ease with which stone could be transported by sea.

Some of the major building projects in Greek sanctuaries required the movement of stone from quarries some distance from the place where it was to be used. For example, rebuilding of the temple of Apollo at Delphi in the 6th century BC involved marble from Paros (Herodotus, 5. 62), and in the 4th century BC the whole temple was rebuilt in limestone quarried from near Corinth. Marble imported from Paros was also used for the pediments and metopes of the temple of Zeus at Olympia. The blocks needed to carve the pair of centaurs with lapith women in the west pediment would originally have weighed some 15 to 20 tons. It has been estimated that the construction of the temple of Zeus would have required approximately 160 tons of marble.

More specialized marbles were also quarried in Greece. *Rosso antico*, also known as *marmor Taenarium*, was a red to purple fine-grained marble quarried on the east side of the Taenarus peninsula in Laconia. The quarries, noted by Strabo (8. 5. 7), may have been worked as early as the Bronze Age. Marble from here was used in the so-called Treasury of Atreus – a Mycenaean tholos tomb – at Mycenae; other examples of its use are known in Crete and Thera. The marble seems to have become popular for inscriptions during the Hellenistic period, and two honorary decrees from Delos, one for a Spartan and the other for a resident of Cythera, used the stone. It was even exported to Cyrene for a statue of Ptolemy II Soter. Sculpture in *rosso antico* also became popular in the late Hellenistic and early imperial periods. From the same area was quarried *nero antico*, a grey to black marble (Pliny, *Historia Naturalis*, 36. 135).

Other exotic stones from Laconia include *verde antico*, which Pliny the Elder (*Historia Naturalis*, 36. 55) described as "brighter than any other marble". These quarries were mentioned by Pausanias (3. 21. 4) as being near the village of Krokeai. The stone was apparently extracted like river pebbles. In the Roman period the mines may have been imperial property. Other Laconian quarries are known in Taygetus, which may have been Roman imperial property, as Strabo (8. 5. 7) recorded that they had been newly opened in his day. On the island of Euboea green cipollino was quarried in Carystus (Pliny, *Historia Naturalis*, 36. 48). Strabo (10. 1. 6) noted that in his day the quarry from which the columns came was located at Marmarium. Strabo (9. 5. 16) noted other exotic marbles from the Greek world, including "decorated" (*poikile*) marble from the island of Skyros.

Archaeological evidence for later quarrying in Greece has been hard to detect. Quarries on Mount Tisaion in Thessaly were probably worked in the Byzantine period, and perhaps also the white marble quarry at Aliki on the southeastern coast of Thasos. The latter appears to have continued being worked into the Middle Ages.

Minoans

Bronze Age inhabitants of Crete

This people, termed Minoans by archaeologists after the legendary king Minos, created between 3500 and 1000 BC a palace-based culture akin to those of the Near East and Egypt. Many of their trappings were adapted later by the Mycenaeans of the mainland (*c.*1600 BC).

The varied natural terrain and therefore resources (organic rather than mineral) of this strategically placed island permitted Neolithic peoples (from Anatolia and the mainland) to prosper by 4000 BC, after three millennia of slower development: their main achievement was the tell at Knossos. Though their material culture was unspectacular, these Neolithic farmers provided the solid base on which the Minoans flourished.

During the pre-palatial or Early Minoan (EM) period (3500–2000 BC) small farming communities were increasingly established in the most accessible and fertile areas – in the coastal plains and the Mesara – though the marginal zones were also exploited and transhumance was probably practised. Many arts and crafts were established, if at a relatively simple level: ceramics, textiles, woodworking, seals, and vases of stone were developed using local resources, but trade and exchange were required to import obsidian, all metals, ivory, faience, and so on. No doubt ideas and concepts accompanied them. Houses were fairly simple, but they had acquired considerable sophistication of plan and furniture by 2500 BC. Tomb architecture tended to be communal: round tholoi were common at the centre of the island, while square bone enclosures and caves were used elsewhere. The burial customs are somewhat obscure, but inhumations were the rule. The varied grave goods deposited point to a hierarchical society. Evidence for religion (and dress) is mostly procured from clay figurines; many were deposited at open-air sanctuaries set on high peaks within sight of the villages they served.

As the population increased and more land was occupied, regional centres emerged: some (e.g. Knossos, Phaestus, Mallia) were destined to last, others (e.g. Monastiraki) were eclipsed. Since weapons were fashioned, this process was probably not entirely a peaceful one. By 2000 BC (Middle Minoan I, or MM I) the first palaces had emerged – administrative and religious centres, controlling territories in the island. The physical expressions of this development had much in common: the palaces were ranges of rooms built around a central court and oriented to the compass points. The social complexities that created them also demanded a system of writing (hieroglyphic), as well as an ever-increasing range of material products, partly for the consumption of the elite, partly for exchange in markets abroad. Though hard to document, expertise in almost every craft was established: Kamares pottery, the exploitation of hard stones, and objects in metals are notable. New ideas continued to flow to Crete down these trading arteries, especially from the east.

Damage, perhaps from earthquakes, around 1700 BC (MM III) only served to spur on Minoan efforts: the Second Palaces arose. The next two centuries witnessed the culmination of power and material splendour – an intensification of all the existing themes. This is the likely time of Minos' thalassocracy: certainly Minoan culture was enormously influential throughout the Aegean and into the Peloponnese; Minoan traders moved and settled from Asia Minor to Egypt, visiting north Greece and probably travelling west to Italy. Modern appreciation of Minoan culture is largely based on the range and quality of goods that poured from the artisans' work areas: elegant, flowing designs; a lively palette; a concentration on natural subjects, courtly themes, and the interplay of this and the other world. The apparent harmony and balance are to our tastes, but they were not achieved in a Utopia. In comparison with the Near Eastern civilizations, the Minoans were less overtly militaristic and grandiose in their portrayal of their world; but they were not pacifists. There is ample evidence for military activities from artefacts and portrayals of warfare; some sports were violent; human sacrifice was practised. Knossos may have achieved a dominance over other cities at this time – as much through economic and religious avenues as by sheer strength. The religious centres were more localized on the palaces; chamber tombs were for collective burials of ordinary people; a few graves, as with the town and country houses, were more splendid and destined for the elite. Indeed, the building campaigns throughout the island represented a profligate expenditure of energy that may have overstretched Minoan resources: there are indications of troubled times in the 1500s BC, perhaps partly prompted by the natural disasters accompanying the eruption of Santorini. Whatever the exact mix of causes, during the last decades of LM Ib (Late Minoan Ib, after 1500 BC) settlements both great and small were destroyed, often by force, and not immediately reoccupied.

Whatever the reasons, the ultimate benefactors were the Mycenaeans, those seemingly aggressive and expanding kingdoms of southern and central Greece who took over Crete around 1450 BC. This can be deduced from the appearance on Crete of material objects, details of dress, burial customs, and other cultural traits that have precursors on the mainland. The centre (Knossos to Phaestus) of Crete became the axis of the Mycenaean power base, their control of the island being loosest in the east. Essentially, the newcomers merely adopted existing Minoan customs: by means of a scribal bureaucracy the palaces maintained a firm grasp on the human and natural resources of the domains, assessing what was available and determining what produce was expected where and from whom. Labour forces in some intensive crafts (such as textiles) were maintained by rations and appear to have been of a subordinate status. Writing was essential to regulate this activity and the script employed is known as Linear B, a syllabary adopted from the earlier Minoan equivalent (Linear A), but now used to write Greek. The Mycenaean/Minoan elite was every bit as successful as its predecessor, the only real departure being the decline in some luxury goods.

By 1375 BC (LM IIIA1) Crete had recovered something of its former pattern of settlement and a prosperous level of material comfort (e.g. burials with bronzes): whatever the exact amalgam of Minoan and Mycenaean, society appeared to be settled. But evidently it was not: Knossos, both town and palace, went up in flames. The cause – disaffected Minoans, another jealous Mycenaean power, or some raid from further afield – is not known. The aftermath is not yet fully comprehended by modern scholarship: debate is divided between those who believe that Knossos and the Mycenaeans remained

Minoans: glazed figure of snake goddess with upraised arms, Crete, *c.*13th century BC, Ashmolean Museum, Oxford

in control for another two centuries, and those who think that palatial control was now mostly swept away.

Something of both factors may have been involved: the pattern of subsequent habitation and burial activities at Knossos and in the Phaestus region points to at least a decline in population and material prosperity, though at Chania something more traditional persisted for some generations. If the balance of control moved away from centralization, nonetheless a broad-based prosperity is much in evidence in the post-palatial period (LM IIIA2–IIIC). Trade networks, an integral factor in Mycenaean control of the Aegean, were still crucial to the acquisition of metals – at least one commodity can be recognized in the large-scale export of oil (perhaps perfumed) in jars manufactured in west Crete. This solid prosperity had a very practical base to it: gone are the luxurious aspects of life, gone indeed are the more rarefied crafts themselves. Gradually new religious icons (goddess with upraised arms) appear; new cultural traits gain favour (larnax, or coffin, burials); iconographies alter (increased stylization in patterns).

Though it is an island, Crete could not escape the disconcerting events that unfolded throughout the eastern Mediterranean after 1200 BC. Most of these had negative consequences for the established cultures: destruction and disturbance of peoples became common from Anatolia to Greece to Egypt. Such events are visible in Crete in the abandonment of settlements and cemeteries from 1200 BC (later LM IIIB), in increasing material impoverishment and regionalization (e.g. small tholoi at the east). After 1100 BC (LM IIIC) people took to the hills in scattered refugee settlements (e.g. Karphi). This erosion was periodic, but relentlessly accumulative; all but the most immediate survival needs were jettisoned. The ebb and flow may have removed some Cretans east to Cyprus, and introduced other elements from the west and north into the island, including those that later became culturally definable as Dorian Greeks. (The east of the island preserved more of its Bronze Age characteristics.) By 1000 BC the Iron Age was evolving: the cemeteries north of Knossos show some continuity, retained by an energetic and emerging society with ties to Athens and further afield east and west.

What memories survived from the Bronze Age are largely centred around legends concerned with Minos; more tentative connections were kept alive by such factors as the recognition that the inhabitants of eastern Crete (the Eteo-Cretans) were in some way more "native". Symbols derived from the Bronze Age past were always used: local pride placed the labyrinth on Knossian coins; Minoan finds were portrayed on stamps of the new Cretan state at the start of the 20th century. To many Cretans today the Minoans are somehow their direct ancestors, whose achievements are to be lauded, protected, and kept unsullied.

Summary

Minoan culture evolved on Crete around 3500 BC. It was based on agriculture and overseas trade. The first palaces emerged *c.*2000 BC as religious and administrative centres. The second phase of palaces arose *c.*1700 BC. The Mycenaeans took over *c.*1450 BC, and the palaces decayed in the following century or two. Crete became increasingly destabilized after 1200 and gave way to Dorian Greek institutions after 1000 BC.

Minorities

Minorities are seen in relation to the majorities that define them. Minorities and majorities are two sides of the same coin, and to attempt to talk of a minority without reference to the majority that defines it obscures by omission or commission the fact that minorities are usually targets of discrimination by the elite of the majority against whom they are defined. A social minority is rarely purely a minority in purely numerical terms. The subordination of a numerically inferior social group is given substance by its exclusion from access to power and the resources available to the social majority. Each age produces its own minorities, but though they should not be thought of as the product of the Hellenic tradition, five categories of outsiders – by class, religion, race, gender, and sexual orientation – can be identified in the four broad periods of the tradition: Classical, Byzantine, Ottoman, and modern. These categories of social outsider are modern in origin; so is the concept of the social minority. In dealing with this subject it is important to remember that, although these categories would not have been familiar to the people of the time, there are indeed modern constructs that we apply to past societies in an honest (it is hoped) attempt to understand those societies better.

Most easily dealt with here are the minorities defined by their sexual orientation. For the Classical period there is considerable evidence for male homosexuality, but lesbianism is much less apparent from the sources. Scholars have now begun to argue in earnest about the nature and prevalence of homosexuality in the Byzantine period, and the nature of the evidence to be used. Evidence of homosexuality in the Ottoman period for the Hellenic tradition should really be seen as an appendix to the Byzantine period, drawing as it does on the same evidence. In the modern period the post-Stonewall "gay liberation" arrived late in Greece, and it remains to be seen how the Hellenic tradition will accommodate it. This material is dealt with in the article on "Homosexuality".

Most clearly a cause for anxiety is the idea of minorities by race. More exactly, this should be defined as minorities by ethnic origin. In the Classical period the most definite component of this group were the barbarians, those who could not speak Greek and whose language sounded to the proud educated Greeks, polished in their speech, like the mouthings of meaningless syllables: "Bar bar ...". The polarization between Greeks and barbarians points out two important facets of the concept of minorities: the barbarians were clearly more numerous than the Greeks, and the Greeks became "the Greeks" by distinguishing themselves from the barbarians and making language a significant marker of difference. Other subdivisions of "barbarians" existed in the Classical period, most notably the Persians and then later the Romans with whom the Greeks perforce came to some accommodation. While the barbarians were useful as a defining concept "out there", minorities by ethnic origin within the Classical city states were more difficult to deal with. Though foreign enemies could neatly be confined to the "opponent" role beyond the walls, the responses and social roles available for the foreign merchants, allies, or "resident aliens" who came to reside in cities such as Athens needed to be and indeed were many and varied. The Classical period is when we first see the social minority by ethnic origin not only as an aspect of the great mass of barbarians "out there", but also as placeholders on a spectrum of shaded proximity to the citizen. During the Byzantine period this "double standard" continued, compounded and confused as it was by the problematic nature of who the "Byzantines" were. The majority called themselves "Roman" if they gave themselves an ethnic identity at all, but spoke Greek; yet to them in their own tongue (Greek), "Hellenic" or "Hellene" meant "pagan" as opposed to Christian. At the same time, however, ethnic identifiers existed for minorities within the empire such as Armenians, Iberians, Cappadocians, and Isaurians. At one level it is clear that there was a shorthand in use, by which "Roman" meant "people like us" (or at least "like me"), but in addition, the Byzantine authors whose works survive show that they were capable of distinguishing between ethnic minorities within the empire if it suited their purpose.

In the Ottoman period the role of the ethnic minority within the Hellenic tradition was clearly reduced since it was of course the "Hellenes" – here conterminous with the Orthodox Christians – who were one of the ethnic minorities (though constituted by the state as a religious minority) in the Ottoman empire. In the modern period the nature of the ethnic minority in the Hellenic tradition is as convoluted as it is for most other societies. How Greek are third-generation Greeks in the United States or Australia? Does "being Greek" mean being able to speak the language? And is that enough, or does it require literacy as well? In addition to the diaspora, which is still scattered, how different are the descendants of those Greeks who returned in the 1920s from Anatolia, or indeed who were incorporated into the Greek state after the Balkan Wars at the beginning of the 20th century? And what is to be made of other ethnic groups that may have self-consciousness but whose existence may appear threatening to a nation state unconvinced that its borders are not subject to the envious glances of its neighbours? What is clear at least is that it is possible to create ethnic minorities when desired. How such minorities are treated – ignored, tolerated, repressed, exterminated, or celebrated – depends a great deal on the nature and self-confidence of the dominant social majority.

Women have always been a minority. Until recently, many observers opined that such a large grouping could not be considered a social minority, but the work of many different kinds of feminists (theoretical, empirical, applied) has shown that women as a social group can be viewed as a minority

because of their differential access to power and their ability to participate in the general life of wider society. Excluded from the political and restricted to the "private sphere" of hearth and home, women form a minority by gender. In the Classical period the women were the citizens who were "not there". The women who appear in the Platonic dialogues or on vases were not the wives and daughters of citizens in an honourable occupation. Their closeted lives are now recovered to a degree, but we know much less about the lives of women than about male citizens. The advent of Christianity (especially in the Orthodox faith with its devotion to icons) is held to have improved the lot of women, who could now escape the fate of child-bride and brood-mare for the role of perpetual virgin and bride of Christ. Sources for the Byzantine period tell us about aristocratic women and nuns, but these escape routes were limited for the mass of those who found themselves in the social minority by gender. The fate of women in the early modern compared to the medieval period is hard to differentiate. The evidence is unclear, and it is often a vested question whether evidence is to be read back to a Byzantine origin or credited as being a development during the Ottoman period. Women as a social minority in modern Greece share all the trials and triumphs of their sisters in other societies who are making the transition from largely agrarian rural communities to modern urbanized industrial democracies.

The minority by religion is a category now firmly out of favour, provoking memories of the Inquisition. In the Classical period the lack of religious uniformity might be thought to preclude the formation of minorities by religion. However, leaving to one side the various schools or choices that arose among the philosophers, a certain basic level of "decency" was expected to prevail, a level below which Socrates was felt to have sunk, even though the charges had all the hallmarks of a stitch-up. The development of Christianity as a credal religion meant that there was much room for disagreement, arguments in which the Greeks appeared to revel. For all the polemics of the first five great ecumenical councils and the bitter acrimony of the iconoclast controversy, the Hellenic tradition in its Orthodox manifestation did not develop the means of dealing with minority viewpoints favoured by the Holy Office in western Catholicism. The minority by religion came into its own in the Ottoman period, when the *millet* (community) system meant that to be Greek was synonymous with being Orthodox Christian. In modern Greece the minorities by religion are the Muslims, Catholics, Protestants, and Jehovah's Witnesses, mixtures of incomers and converts that show the multiple origin of these social minorities.

The final category of minority is that created by class. In the Classical period, in addition to the poorer citizens, there was the numerous class of slaves, a source of labour without which the civilization of Athens would probably never have emerged. This differentiation based on wealth implies a further distinction based on education or rather the access to education. The speeches that have come down to us from the Athenian assemblies make it plain that it was important not to alienate the jurors by appearing to talk down at them. Perhaps even because of their awareness that they lacked the education of some of the leading citizens, it was all the more important not to be seen alluding to it. This concern with education as the pre-eminent marker of class continued in the Byzantine period. Education gained in Constantinople meant that one had arrived; education could be obtained in the provinces, but it would always remain rustic in character. Though a hierarchical and stratified society, Byzantium was not closed to advancement by merit (usually by means of an education) and the criticisms levelled at these *nouveaux riches* indicate that the phenomenon was not unknown. But in general the accumulation of wealth as an end in itself was not common: Byzantium was a meritocracy, not a plutocracy. Though learning was also a feature of the elite of the Phanar in the Ottoman period, this was usually put to good use in the accumulation of capital, which was then expended in gaining one of the offices of the Ottoman state. The theme of education and how one spoke was one of the great fracture lines for the first 150 years of the modern Greek state. The question of the "two languages" (whether modern Greek was to be in the form commonly spoken by "the people" – i.e. demotic – or in a "purified" form that revived Attic forms or created Atticisms – i.e. katharevousa) should not be seen as a class question; but, as with the more overtly political struggles between parties in modern democratic Greece, there are aspects allied to class in the questions of how one should vote and how one should speak.

This article has imposed a strict order on the minorities that have existed in the Hellenic tradition since the Classical period. In doing so, I have done disservice to the many people who lived and died as part of those minorities. All human beings experience life as a cluster of different social roles; some are definitive and enduring, some are ephemeral. The roles, no matter how many or how few, are not static; nor are they exclusive. Even roles that to us appear impossible in combination, may be united in one individual for some period of time. Human experience comes in infinite diversity and infinite combination. The idea of minorities is one way of attempting to come to understand that diversity. We fail in our task however if we stress the analytical category of "minority" over the people who formed the minority and gave it life.

Missionaries

The Great Commission is the missionary duty given to Christians by Jesus Christ before his Ascension. The Gospel of Matthew reports that Jesus commanded his followers to "go out, and make disciples of all nations" (28: 19). Christianity is a universal religion that enjoins its followers to spread the good news of salvation to the ends of the earth. The universal character of the Christian faith contrasts starkly with the local or tribal and non-missionary character of most other religions.

The book of Acts records the beginning of the great apostolic missionary work, when the apostle Peter preached in Jerusalem at the Jewish Feast of Pentecost. Several thousand people became converts on that day (Acts 2: 1–41), and the new faith quickly spread to Greek-speaking Jews in Jerusalem. These were so numerous that a conflict developed between the Aramaic-speaking and Greek-speaking converts over the distribution of food to the widows in the community. To handle this a special ministry was created, the office of deacon. The first deacons all have Greek names (Acts 6: 5).

One of the original deacons, a Hellenistic Jew named Stephen, was the first martyr (*martyrion*, witness) of the Church. His death signalled open persecution, which caused the new community to disperse. This provided the opportunity for new fields of mission over the known world of the day. Acts describes how Philip, another Hellenistic deacon, converted an Ethiopian. The man is identified as a eunuch, and the treasurer of the queen of the Ethiopians (Acts 8: 26–39). The story illustrates the point that the universal message of the Gospel is no respecter of human conditions, but accepts all.

More than half of Acts is devoted to the missionary work of the apostle Paul who made three major missionary journeys. On the first he left Syrian Antioch, sailed to Cyprus, crossed the island, sailed to Pamphilia, and then travelled to other places including Iconium before returning to Antioch. The second journey again started in Asia Minor: Paul travelled to Macedonia after receiving a vision of a man there beckoning him to come over. Eventually he arrived in mainland Greece. Everywhere new churches were started. The third journey reinforced the work of the previous two.

The mission work of Paul was facilitated by the Greek language. As the lingua franca of the eastern part of the Roman empire it made communication with vast numbers of people possible. The translation of the Hebrew scriptures into Greek, the Septuagint, had occurred well before the Christian era. This meant that Paul and other missionaries could use the Old Testament in Greek. Also the widespread use of koine Greek offered a ready medium for writing the documents that eventually became the New Testament. All but five of the New Testament books are pastoral letters by Paul or others. Most of them were written to mission churches to deal with pastoral concerns.

There were many Greeks or Hellenistic Jews in Paul's circle of missionary associates. Yet from internal evidence in the Book of Acts and other New Testament sources, such as Paul's letters to Timothy who was ministering on Crete, it is evident that from the beginning much of the mission work was being done by nameless Greek-speaking individuals.

The works of the early Church Fathers, both before and after the Council of Nicaea, report conversions among different peoples and the establishment of new churches in India, Ethiopia, Armenia, Georgia, and elsewhere. The mission work of Greek-speaking Christians continued under the Byzantine Church. In the 9th century two brothers, Greeks from Thessalonica, Methodios and Cyril, became missionaries to the Slavs. In order to translate the Bible and other religious books into Slavic languages a new alphabet was developed: the Slavonic alphabet is based on the Greek alphabet, but it employs different characters to express Slavic sounds. The mission work of Cyril and Methodios converted the Moravians (who were later reconverted to Roman Catholicism, but with a remembrance that would eventually usher in the Hussite Wars and later still the mission work of the revived Moravian Church). Eventually the east Slavs, and most of the south Slavs, were converted to Christianity by Byzantine missionaries, whose work followed the pattern set by Cyril and Methodios. Byzantine converts included the Bulgarians, Serbians, Russians, Ukranians, and even the Latin Romanians.

The mission work of the Greek Orthodox Church was severely retarded by the Muslims after the fall of Constantinople in 1453. For more than 300 years only the Russian Orthodox Church among the churches of the East was free to continue missions. By the 1800s the Greek Orthodox Church began to regain its independence, and missionary work started to recover soon afterwards. Towards the end of the 19th century the mission tradition was revived.The modern Greek diaspora has generated new mission work by various Orthodox associations, much of it to emigrant Greeks around the world. Mission efforts in East Africa and among non-Greek peoples in North America and Australia is also bearing fruit.

Missolonghi

Town in Acarnania

Missolonghi, a fishing town on the shore of an extensive shallow lagoon, became one of the most famous names of the Greek War of Independence both because Lord Byron died there in April 1824 and because of the bravery and suffering of its defenders during the siege of 1825–26.

Missolonghi, with other parts of western Greece, joined the revolution in June 1821, massacring almost all its Muslim inhabitants. The town's strategic importance for communications between Roumeli and the Morea (the Peloponnese) helped to make it the headquarters of various groups over the next few years and particularly of Alexander Mavrokordatos and his supporters. Mavrokordatos was present during the first Turkish siege (November 1822–January 1823). Turkish and Albanian forces laid siege to the town following their victory at Peta. The defenders, including Markos Botsaris and his Suliots, were helped by bad weather, disease in the Turkish ranks, successful exaggeration of the number of foreign volunteers present, and Hydriot ships which broke through the Turkish blockade with supplies. By the time the besiegers risked a major assault on Christmas Day (6 January 1823) up to a thousand men from the Morea had managed to get through to reinforce the Missolonghiots. The assault failed and the siege collapsed; heavy losses were suffered on the Turkish side as the defenders became pursuers.

In December 1823 Mavrokordatos returned to Missolonghi with 14 Hydriot ships which broke the renewed blockade, and was re-established as director-general of western Greece. On 13 December he was joined by Colonel Leicester Stanhope, and in January 1824 by Byron, the representatives of the London Greek Committee. Among the measures they encouraged or undertook was a strengthening of the town's hitherto weak defences. (The blockade had been reimposed soon after Byron's arrival.) Stanhope engaged also in educational planning, set up a dispensary, and established a printing press which printed, among other works, an edition of Dionysios Solomos's *Hymn to Liberty* and two newspapers: the *Ellenika Chronika* (January 1824–February 1826), in Greek and edited by the Swiss philhellene and pharmacist Jean-Jacques Meyer, and the Italian *Telegrafo Greco* (March–December 1824). (On the whole the newspapers reflected the Benthamite utilitarian views of Stanhope and supported Mavrokordatos; probably they were read mostly by foreign sympathizers.)

Byron's death catapulted Missolonghi to European and American fame, preparing the way for its further association with heroism after its fall in 1826. Reshid Pasha commenced his siege in the spring of 1825. It long seemed likely to fail; Miaoulis's ships succeeded in delivering supplies in June and in August recaptured islands in the lagoon taken by Reshid. The defenders made successful sorties on 21 September and 13 October. But the situation changed radically once Ibrahim Pasha and his large force of Egyptians arrived on the scene in December. The blockade was tightened and supplies began to run low (a situation only partially and temporarily alleviated when Miaoulis again managed to get through with supplies in January 1826; his attempt to repeat this on 12 April failed). Even in early April Turkish and Egyptian attacks were beaten back by defenders by now, apparently, living mostly on seaweed and in a town shattered by heavy bombardment. They stoutly refused the Turkish offer to accept a conditional surrender. Finally, it was decided that the garrison and people of Missolonghi – except those too weak to try – would make a great sortie or *exodos* on the night of 22–23 April 1826, in the hope that as many as possible could escape to safety through enemy lines. This was to be facilitated by a simultaneous Greek attack from the besiegers' rear. But a deserter revealed the plan and the element of surprise was lost. An uncertain number succeeded in the sortie, in many cases only to fall prey to the Albanian cavalry who awaited them on the slopes of Mount Zigos. (About 1500 people survived and reached the safety of Amphissa.) Many more rushed back to the batteries amid general confusion. The Turks and Egyptians seized the walls. At dawn they moved in to sack the town. Some of the inhabitants blew up themselves and some of their assailants at the first and second powder magazines and at a windmill which held out until 24 April. The others were killed or enslaved. Estimates of numbers vary, but roughly 8000–10,000 of the 10,000–12,000 in Missolonghi before the *exodos* died or lost their freedom. (The town was regained by the Greeks when its Albanian garrison surrendered on 18 May 1829 after Sir Richard Church's successful campaign in western Greece.)

There was widespread shock at the fall of Missolonghi, tempered by admiration for the heroism of the defenders. The tone most often associated with the last months of Missolonghi is that of a letter from Jean-Jacques Meyer written a few days before he and so many others died in the final sortie: "It is an exhilarating spectacle to behold the ardour and devotion of the garrison amid so many privations. ... I declare to you, that we have sworn to defend Mesolonghi foot by foot, to listen to no capitulation, and to bury ourselves in its ruins. ... History will do us justice, and posterity weep over our misfortunes." Even George Finlay, one of the most sceptical of philhellenes and historians, felt that "A spirit of Greek heroism, rare in the Greek Revolution – rare even in the history of mankind – pervaded every breast" on this occasion; "the conduct of the defenders ... will awaken the sympathies of freemen in every country as long as Grecian history endures." The sort of great and inspiring events which western Europe generally sought in ancient contexts was found, importantly for the maintaining of philhellenic feeling, in the modern siege; it rivalled that of Plataea [in the Peloponnesian War], said Finlay, "in the energy and constancy of the besieged". To the already mighty surge of responses to Byron's death, which often included at least a mention of Missolonghi, were added, mostly in 1826–28 and mostly in French, German, or English, pamphlets, maps, cantatas, poems, plays, novels, all related to the siege and fall

of the town. One of the best-known responses is Eugène Delacroix's painting *Greece on the Ruins of Missolonghi* (1826). And in Greece itself the siege was commemorated in poems including Solomos's *The Woman of Zakynthos* (*c.*1827) and *The Free Besieged*, the memoirs of survivors and their contemporaries such as Nikolaos Kasomoulis, and – with the other notable events of the 1820s – the Garden of Heroes in Missolonghi. This includes the tomb of Markos Botsaris, Byron's statue (1881), and the tumulus of the defenders killed in April 1826.

It would be difficult to maintain that the town's fall alone had any lasting effect on the course of the war, but it was clearly a major factor in encouraging European and American philhellenes to contribute an amount estimated by Douglas Dakin at £70,000 to the Greek cause during 1826, and helped to move foreign governments further in the direction of intervention.

Summary

A fishing town on the coast of Acarnania, Missolonghi was the centre of resistance to the Turks in western Greece during the War of Independence. A Turkish siege in 1822–23 was beaten off. Byron died there of fever on 19 April 1824. The final siege took place in 1825–26 resulting in huge Greek losses. The town was regained by the Greeks in 1829.

Mistra

City in the Peloponnese

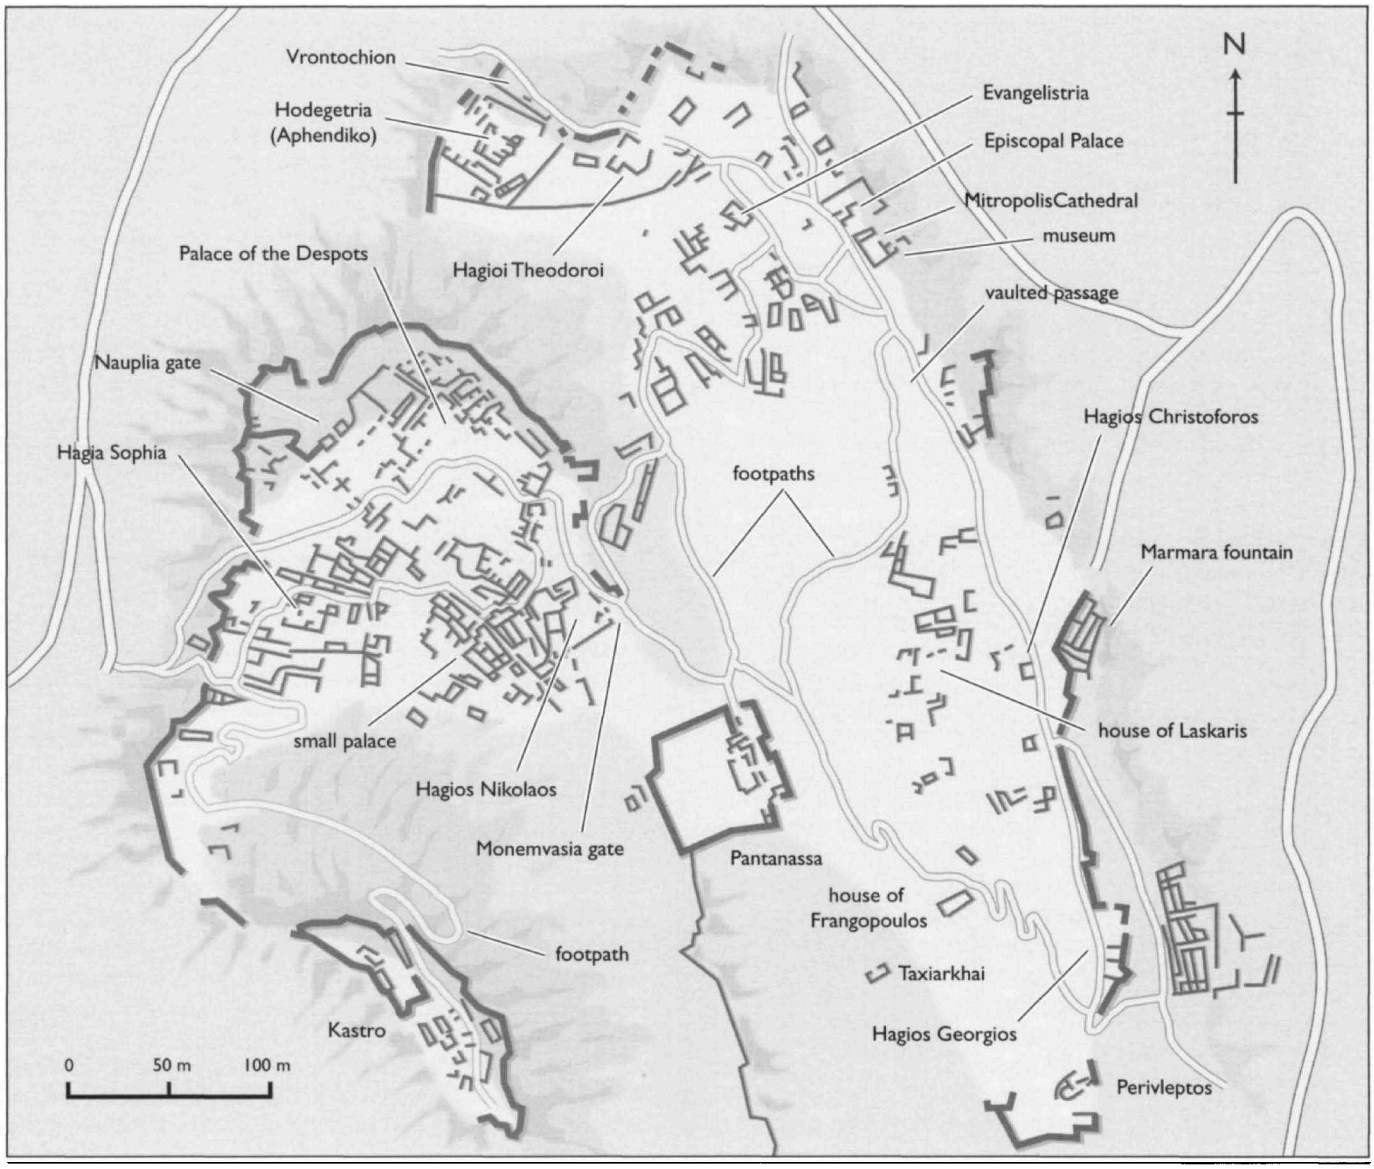
Mistra remains today as probably the best-preserved of all later Byzantine sites, and its relative completeness allows the visitor to experience in the most authentic way the qualities of a Byzantine town developed in the last two centuries before the coming of the Tourkokratia. Its assemblage of churches, palaces, and houses, which have not been significantly altered since the 15th century, represents the most complete reflection of the appearance, architecture, and art of a Byzantine town of that period that we have.

It consists of a fortified city, located some 5 km to the west of Sparta in the Peloponnese, occupying the steep slope of a spur of Mount Taygetus; its summit is crowned by a castle. Mistra has no Classical, early Christian, or earlier Byzantine history; the name first enters sources in the mid-13th century when Guillaume de Villehardouin, the fourth of the Frankish princes of Achaea, chose it as the site of one of the four castles that he built to contain the Slav tribes that then occupied the southern Peloponnese.

The ruins of his castle still dominate the hilltop, with sheer cliffs falling away to the south and southwest. The keep and enceinte indicate the scale of his installation here, but he was only to be in possession of it for little more than ten years; in 1262, two years after he was taken prisoner at the Battle of Pelagonia, he was forced to cede it to the Byzantines, with three other Frankish castles in the Peloponnese, as the price of his freedom. It was at this point that the history of Byzantine Mistra began, although it was the elevation of the city to being the seat of the despot of the Morea in 1348 that was to usher in the period of its greatest renown. This lasted for just over a century, until in 1460 the last despot, Dimitrios, was forced to hand over the city to the victorious sultan, Mehmet II.

The importance of Mistra for the Hellenic tradition lies in two separate fields: its physical survivals and the vigorous intellectual life that flourished there. Among its buildings pride of place must go the palace of the despots; this substantial L-shaped complex, built in several stages on the only major piece of level terrain, contains a large hall some 40 m long,

Mistra: view from the gate looking southwest to the castle



25. Mistra

which must have served as a throne room. This is in all probability the best reflection we have of that used in the Blachernae palace in Constantinople. Among other secular buildings, besides a number of smaller houses, there are two further large dwellings, one known as the Palataki ("Little Palace") and the other as the House of the Laskarids; these again provide some of the most authentic surviving evidence for the appearance of later Byzantine domestic architecture as used by a relatively affluent official or merchant.

The church of the Mitropolis, dedicated to St Dimitrios, was always intended to be the cathedral of Mistra, and has undergone major reconstruction; first built as a three-aisled basilica in 1291/92, it was the only church without a dome in the city until it was altered (probably in the 15th century) by having the barrel-vaulted roof removed and a dome erected. Both the foundation and the reconstruction are recorded in inscriptions as being by bishops of Lacedaemonia. Six other churches in Mistra have been preserved, all built between the later 13th and early 15th centuries, all domed, and most displaying a knowledge of contemporary building practice in Constantinople. That of the S Theodore, begun just after 1290, has an octagonal design that may have been an emulation of the church of Hagia Sophia in Monemvasia but relates to other important church designs such as that of Dafni, near Athens. The plan that was most frequently adopted by builders in Mistra was first used early in the 14th century in building the church known as the Aphendiko, dedicated to the Virgin Hodegetria. Its main characteristic is that of a basilica with galleries on to which a domed cross-in-square has been imposed; an open colonnade occupies the exterior of the south side, which is a characteristic of several other churches of the city. The frequency with which this type was used may have been because it could accommodate larger numbers on a given ground area than a more conventional inscribed cross design.

Other foundations of the 14th century are those of the Virgin Peribleptos, its design accommodated to its being built against a cliff, and Hagia Sophia, which was founded by a despot, Manuel Kantakouzenos, and probably intended as a

palace church. One of the last major churches to be built in Mistra, and that with the most Western characteristics, was that of the Pantanassa; founded by an important official of the despotate, John Phrangopoulos, and dedicated in 1428, it continues to be used as a convent, and is the only building still remaining in use.

Most of these churches retain much of their original decoration, and this again allows a glimpse of the brilliant final phase of Palaiologan art as it developed in the last two centuries of the Byzantine era. The high quality of the church architecture of Mistra was complemented by artists of equal accomplishment; the wall paintings that they have left indicate the increased interest in liturgical subject matter and extensive cycles of secondary themes, with series of the Twelve Great Feasts of the life of the Virgin, Passion cycles, and figures of individual saints.

The location of Mistra, relatively remote from Constantinople, meant that during its last century as a despotate a spirit of intellectual enquiry developed that would not have been tolerated in the capital. First under the Kantakouzene despots Michael, Matthew, and Dimitrios, and then increasingly under the Palaiologan despots, the two Theodores, Thomas, Dimitrios, and Constantine, the city became a prominent intellectual centre. The famous philosopher, George Gemistos, who later took the name of Plethon, taught here from *c.*1410 until his death in 1452, after his friend the emperor Manuel II Palaiologos had advised him that his radical approach was upsetting the conservative clerics in the capital. Among those who came to learn from him were George Scholarios and John Moschos, who was to be his successor as the leading philosopher of the city. But his most renowned pupil was John Bessarion, the native of Trebizond who, as a cardinal, was to become one of the most famous Greek converts to Roman Catholicism, and who studied for several years at Mistra under Plethon from 1431. It was to be the fame of Mistra as an intellectual centre that also brought Italian scholars to study the language and thought of the ancient Greeks that Byzantium had guarded for so long; it was through them that the Hellenic tradition was to be widely disseminated in western Europe.

Mistra began its history under Turkish occupation as the favoured residence of the Pasha who governed the Peloponnese, but it did not retain this distinction after the outbreak of the War of Independence. In September 1824, in the course of the appalling destruction wrought by Ibrahim Pasha right across the Morea, Mistra was left a smoking ruin. It was not until late in the 19th century that the French Byzantinist, Gabriel Millet, was to initiate the restoration of the city which is now so much admired as an embodiment of medieval Hellenic culture.

PAUL HETHERINGTON

Summary

First occupied as the site of a castle by Guillaume de Villehardouin in the mid-13th century, Mistra was ceded to the Byzantines in 1262 after the Battle of Pelagonia. In 1348 it became the seat of the despot of the Morea. It has important remains of a complete Byzantine town. It was also the centre of a vigorous intellectual culture. It fell to the Turks in 1460 and was destroyed in 1824.

Modern Period

The study of Greece in the modern period has often been made in terms of failure. Why did Greece suffer so many political and economic crises? Why was its ability to create wealth substantially less than that of many other countries? Why could Greece not prevent the haemorrhaging of its population in migration? Why did so few of its cultural products achieve international circulation? These questions tended to measure performance in comparison with other states (sometimes unnamed) that have enjoyed much more favourable geographical and historical circumstances than Greece, leading automatically to negative conclusions. Now that Greece is increasingly successful even by such externally drawn measures, it is time to change the approach. Greece has a position towards the bottom of social and economic indicators for the European Union, but far above its neighbours in southeastern Europe. In cultural terms, it is extremely active in comparison with other developed states of its size, especially surprising in spheres where comprehension of Greek is essential for full enjoyment of the works produced. International cultural success for small countries is haphazard and frequently owed, as will be seen, to factors connected with their very political and economic marginality and weakness. The brief and schematic analysis that follows will begin by looking at Greece as far as possible in its own terms and sketching the development of a specific Greek identity in the modern world. It will then examine the relationship of that identity to modern Greek culture and its reception outside Greece.

Towards the end of the Tourkokratia the first traces of industry were beginning to appear in the Greek lands. Most Greeks, however, were subsistence farmers with little or no education. This group has, naturally, left little record of its thoughts and aspirations, except for those fighters in the War of Independence who found ways of leaving written memoirs. It is clear that most Greeks resented the Turks' oppressive and arbitrary behaviour towards their subject populations. It is less certain what was felt to be the alternative – Greek dreams of what their world might be like if Turkish rule were removed. Probably most were still thinking within the framework of the

Byzantine empire. Since the foundation of Constantinople a millennium and a half before, the whole area had been ruled as a multicultural empire centred on that city. The characteristics of the rulers had varied, particularly with the fundamental change to a Turkish sultan in 1453. But the overall politico-geographical structure had remained the same. Rigas Velestinlis, a democrat intellectual, promoted a multicultural democracy within a Byzantine envelope. Most of the fighters of 1821 probably had something similar in mind, perhaps thinking of a Greek emperor ruling a diverse population.

Greek urban structures during the period were idiosyncratic. Besides the few towns in the Greek lands there were large Greek populations in Constantinople and Smyrna and substantial Greek minorities in towns in the Romanian principalities beyond the periphery of regular Greek habitation. More important still, the arbitrariness of Ottoman rule had led to the establishment of significant Greek communities in western European commercial cities. These were groups of merchants, managing much of the trade of the Ottoman empire from a position beyond the reach of its officials. This external Greek bourgeoisie was in close contact with some of the most advanced entrepreneurial groups in Europe. It was also a major channel for the ideas of the Enlightenment into Greece. It financed, for example, a major redirection of the printing of books for the Greek market away from Orthodox service books and popular devotional literature towards other functions, especially connected with ancient Greece. This change reflects Enlightenment interest in Classical studies, secularism, and nationalism, which came together in the promotion of a modern Greece as a direct descendant of ancient Greece. It is clear that some merchants of the diaspora were beginning to link the removal of Turkish power with the establishment of a specifically Greek state. It is uncertain how many had made the imaginative leap required to redraw the political map of southeastern Europe from a single empire to a series of small nation states. One important factor is that the diaspora retained a Greek identity, though it might easily have been assimilated into local populations. The image of the Greek merchants was also cosmopolitan and attractive to the countries in which they were active, especially in eastern Europe.

The Greeks of Greek lands largely called themselves "Romioi", a name deriving from the multicultural identity of Byzantium as the eastern continuation of the Roman empire. Outside the Ottoman empire the name "Hellenes" was becoming more current. This had specific Greek connotations, looking back to the ancient name of the Greeks. It can be used to trace the rise of a specifically Greek nationalism based on connections with the ancients. The two world views met in the memoirs of the illiterate general Makriyannis at the moment of the revolution. Before the declaration of independence, the heroes of the story were the Romioi. After that time the same characters generally became Hellenes. In the areas of fighting the war caused an unprecedented movement of people and of ideas, particularly nationalist ideas. The revolutionaries were mainly Greek-speaking, though certainly not exclusively so. The project of a Greek national state provided some much-needed cohesion among the fighters. It soon became clear that the areas that might hope to be free as a result of the revolution would be the regions that had been central parts of ancient Greece. What is more, the reception of the conflict in the capitals of western Europe was as a renaissance of ancient Greece. Greeks and philhellenes seeking money and support there – or at least abstention from intervention in favour of the status quo – found the Greek national identity and its links with antiquity were useful arguments for their cause. Ancient Greece had been in favour in Europe throughout the Renaissance and the Enlightenment and had dominated Romantic Neoclassicism, which was still an important cultural movement in 1821.

The nationalist intellectual revolution of the 18th century which led to the basically nationalist political revolution of 1821 was continued in the establishment of the modern Greek state. This had been born, largely coincidentally, at a moment when its ancient culture was the centre of world romantic interest. As a result, it was natural for Greece to give enduring prominence to that aspect of its traditions. Greece has presented itself to the world to a large extent as a country of descendants of the glorious ancients. This fact has had a major influence over its cultural development.

The spread of such ideas in Greece was only increased by a high-profile attempt to deny them. The Austrian historian Jakob Philipp Fallmerayer published his work *Geschichte der Halbinsel Morea* in 1830, when Greek independence had been achieved but its nature remained uncertain. He listed the evidence for major settlements of Slavs and Albanians in Greek lands during the Middle Ages. From these facts he drew the ridiculously overstated conclusion that there was no ancient Greek blood at all in the veins of the modern Greeks, thus dissolving the genealogical basis of current Greek nationalism. Reactions to Fallmerayer were intense. In fact, parts of 19th-century Greek scholarship appear to have been moulded by the need to prove him wrong, such as the prominence of *laographia* (folklore) as an academic discipline devoted to finding remnants of ancient Greek culture in the contemporary Greek countryside. At another level Fallmerayer also contributed to the rehabilitation of Byzantium in Greek history. It became obvious that extreme nationalist historical constructs that jumped from the Roman conquest of Greece in the 2nd century BC to the revolution of 1821, treating everything between as a foreign occupation, were dangerous because of the huge temporal gap between the designated Greek elements, whose genuineness could thus be undermined. Konstantinos Paparrigopoulos cemented his place as the founder of modern Greek historiography by establishing a tripartite view of Greek history, with ancient, Byzantine, and modern periods, which has been dominant ever since.

The 19th century saw the promotion in Greece of all things ancient Greek, but in ways that were often shallow and uncomprehending – the so-called *progonoplexia* or ancestor-obsession. The 20th century saw a less intense continuation of the same tendency, particularly during the right-wing regimes of Metaxas (1936–41) and the Colonels' Junta (1967–74). To this day activities celebrating ancient Greece are more likely to win Greek diplomatic support outside Greece than those related to later periods. But however indiscriminate this support of Classical culture may have been, it is difficult to avoid the assumption that it has performed a useful function, at least inside Greece and on its borders. The different areas of Greece, as they were successively freed from foreign control

and added to the Greek state, contained numbers of ethnic and linguistic minorities. Many of these had the potential to cause intercommunity friction of types distressingly frequent to the north of Greece in the 1990s. With the help of the exchange of populations in 1922 and other historical circumstances that forced some of the disparate elements across the northern borders, Greece has been able to absorb and assimilate all but the Turks of Thrace. What was the reason for this success? The difference between the Greek identity and less effective equivalents to the north must surely have been its complexity, great historical depth, and sweeping claims to cultural importance on a world scale.

The success of the national connection to the ancient world has been spectacular, but not unchallenged. The privileged position it gave to ancient Greece has been seen by many (not without justification) as a western European concept imported into the Greek identity, and has been unwelcome to some defenders of Orthodoxy and nationalists with an anti-Western slant. The Romioi are still occasionally promoted as alternatives to the Hellenes. This is the first of several tensions to be mapped here: ancient Greece and Byzantium (with its extension into the Turkish period) are not only successive elements in Paparrigopoulos's tripartite division, but also, in some minds, competing focuses of national identification and of the authentication of Greek importance in world history.

This ambiguity had a major influence over the Greek language question. All levels of Greek in the Turkish period had developed features, especially lexical items, that showed Turkish influence. The written language, developed from that of Byzantium, included a varying degree of archaism. At the spoken level, Greek was a closely related set of dialects which had yet to go through the discipline of the creation of a national language. Besides these the nationalism of the 18th century grafted a preference for ancient Greek, which had also played a considerable role in the linguistic discussions of the American and French revolutions. Thus the first phase of the language question involved three linguistic levels: two written patterns linked to the ancient and Byzantine worlds respectively, and the developing spoken vernacular.

Adamantios Korais was a passionate believer in the civilizing, revolutionary force of Ancient Greek. Yet, as a democrat and linguist, he realized that a national language must be based on spoken Modern Greek. He therefore created his "middle way", katharevousa, claiming a vernacular basis but selectively using the fluidity of the spoken language to build as many bridges as he could to Ancient Greek, so that the young Greeks on whom he based his revolutionary hopes should have as much access as possible to the revolutionary power of the ancients. It was obvious soon after his death that this experiment was a failure in its own terms. But the language that resulted was not very different from the old Byzantine written language, purged of Turkish elements and brought up to date for the demands of national independence. When Korais's influence was removed, the two forms united. Katharevousa thus inherited the support both of the conservative and Byzantine tradition of the early Turkish period and of the radical new nationalism linked to Ancient Greek. The former tendency gradually subsumed the latter, but never obliterated it.

Katharevousa became on one level a mark of snobbery, the way in which the well-educated separated themselves off from those less privileged. But it was also supported by many who were disappointed by a perceived failure of the Greek state to live up to the traditions of Hellenism. It was admirably suited to abstract discussions of the destiny of the Greek nation – in support, for example, of the Great Idea. From the final decades of the 19th century it was opposed by an organized demoticist movement, whose first leader was Yannis Psycharis. The demoticists refused to take the sources of national identity from any past tradition, but based themselves on the living language and traditions of the Greek people. They made play with the fact, as mentioned above, that the prominent position of ancient Greek in the nationalist construct was essentially a Western idea. The most successful of the demoticists were the "Generation of the 1930s", as we shall see. They succeeded in establishing a demotic view of the national identity to provide a powerful counterbalance to the learned traditions used to support katharevousa. The language struggle has been the dimension of Greek life in which the issue of identity has been fought most openly. It was inevitable that the demotic side should win, though surprising that it took so long – till 1975. There is now some recognition that all the parties in this long struggle represented more or less valid Greek traditions which need to be integrated into a more inclusive Greek identity.

There was discussion above of one major tension in the Greek identity, that represented by the labels Romioi and Hellenes. A second, simpler, tension is between Eastern and Western elements in Greek culture. At one level Greece is a member of the European Union, proud that the ancient Greeks laid the groundwork for Western culture, and regarding the West as synonymous with all that is positive and democratic. Constant disagreements with their large neighbour Turkey tend to confirm Greeks in rejection of the East. But at another level, many Greeks fail to identify completely with the western European lifestyle and capitalist work ethic, and often suggest that they have more in common with the Middle East than food and popular music. This dichotomy is particularly strong in Cyprus, where Greeks feel closer to the Levant than to Athens, while simultaneously being more influenced by western European values as a result of their British colonial heritage. Orthodoxy also connects Greece to Slavic eastern Europe. Greek separation from western Europe is inscribed in the language: a Greek going to Brussels (or Paris or Berlin) for a European Union committee can describe him or herself as "going to Europe", implying that Athens is outside Europe at one level of his or her mental map.

Another tension in the Greek identity may also be illustrated linguistically. The word for "country" or "fatherland" used in patriotic discourse is *patrida*. But this is not the most common use of that word: it usually means a narrower area, probably the village or town from which a person originates, or perhaps a wider area such as Epirus, Macedonia, or Crete. Much of Greece is geographically divided into small areas, such as islands or valleys surrounded by high mountain walls. This led to fragmentation in the ancient world, and perhaps predisposes modern Greeks to narrow loyalties. The use of the word *patrida* shows that the nation and state are not so firmly established in Greek consciousness as in equivalent countries where nationhood was achieved earlier. The adjective *xenos*

(strange, foreign) may be used to prove the same point from the opposite perspective. "Strangers" or "foreigners" for a Peloponnesian villager may be Turks or Epirots, but they could equally well be fellow-Peloponnesians, even from the next village. At its most extreme, the focus of loyalty can be reduced to the family, which remains the main Greek economic unit. Anthropologists have drawn the conclusion that a Greek has a variety of possible identities, spreading from his or her immediate surroundings out to the level of the Greek state. The meanings of *patrida* and *xenos* in each case need to be negotiated in and out according to context – surely an extremely flexible and functional system to provide individual satisfaction, but not one that makes the Greek government and economy easy to run.

A substantial proportion of the world population of Greeks and Cypriots is not normally resident in Greece or Cyprus. This new Greek diaspora, made up of migrants who left Greece for economic reasons (or Cyprus as a result of the Turkish invasion), is found on every continent in larger or smaller numbers, making up a total of perhaps a third or a half of the metropolitan populations. The Greek identity is a pervasive one, operating at the level of language, religion, and what is called "behaviour and customs" (*ithi kai ethima*). In most parts of the world, Greeks have resisted assimilation for longer than most other nationalities – though of course assimilation will happen eventually, especially if the country of settlement speaks a major world language. The diaspora Greek needs the metropolitan centre to preserve a Greek identity in the new country, but is often rather contemptuous of some factors in Greece, particularly the economic problems and lack of unity. On the other hand Greece's representatives in countries with many Greek migrants, seeking to preserve their compatriots' Greek identification and waning linguistic skills, need their support to send money home and to put pressure, at moments of crisis, on their new governments, especially that of the United States, on behalf of the Greek or Cypriot states. Greeks outside Greece are often economically very successful. Unfortunately they are rarely easy to coordinate into an organized lobby.

None of the tensions mentioned here is unique to Greeks. But the combined force of these arguments may indicate that Greekness is unusually complex, demanding, and interesting. The root of the complexity is that the Greek identity, especially if one includes elements usually placed under the heading "Romioi", has a much longer and more celebrated history than the Greek state. That state may be viewed as a Western imposition from the perspective of a defender of Eastern Orthodoxy, as an alternative focus of loyalty by a proud Cretan, as a cesspit of cynical politics by those who would prefer to speak in terms of ancient Greek idealism, or as a beloved country that nevertheless has to be left behind by the Greek migrants of Toronto or Melbourne. Thus the Greek state is usually seen in a comparative way, often at a disadvantage, rather than forming a more uncontested background to individual identities, as in many other countries.

On the other hand the Greek identity of which the state is the core has undoubtedly been very successful in maintaining Greekness among populations where it is challenged. We have noted its power at several historical stages: among the merchant diaspora in Europe before the Revolution, among minorities in the expanding Greek state, and among the wider diaspora of economic migrants in the 20th century.

It remains to examine briefly the development of Greek literature, music, and the visual arts. There are detailed treatments of the different cultural fields available elsewhere in this encyclopedia. This article will concentrate on the ways in which Greek culture and its reception outside Greece reflect and are influenced by the elements of identity already discussed.

The diachronic quality of the Greek identity, including ancient Greece and Byzantium along with modern Greece, is pervasive throughout Greek culture. The most obvious technique is simple juxtaposition, the inclusion of persons or objects from the past in a modern Greek urban scene or countryside, surprising the viewer or hearer with a kind of anachronism, as in the paintings of Konstantinos Parthenis, the cinema of Thodoros Angelopoulos, or the poems of Yiannis Ritsos. Elsewhere there is a juxtaposition of genres: the reference may place ancient or Byzantine phrases in a modern demotic framework, or use a musical structure combining Byzantine chant with modern rhythms inspired by folk songs and *rebetika* (low-life music). The poem *Axion Esti* of Odysseus Elytis and its musical setting as an oratorio by Mikis Theodorakis are sustained examples. The audience for Greek culture has learned to expect such references, which have become almost a defining characteristic of various genres, bringing their own idiosyncratic aesthetic charge. There has been at times some tendency to undervalue Greek works which concentrate on issues that Greece shares with the rest of Europe or the world, in favour of those that have an exclusively Greek dimension, and therefore offer wide scope for diachronic treatment. This tactic gives cohesion and unity to Greek culture, and can lead to striking artistic success, though it can easily be overdone.

Another characteristic of Greek culture which has become popular abroad derives from Greece's position on the borders of Europe and Asia, East and West, combined with the fact of its recent rapid urbanization and industrialization. Just beneath the surface of Athenian society one may find the rhythms of the Greek countryside, where most middle-aged Athenians were born. What is more, the popular culture of Greece has for many Europeans and Americans an oriental and exotic otherness, often discovered via tourism. An excellent example of the resulting cultural influences is Michalis Cacoyannis's film *Zorba the Greek* (1964). The folkloric picture of Greece provided is true neither to the Kazantzakis novel on which it is based nor to the real country life of Crete that both novel and film purport to portray: the film succeeded, in part, because it fulfilled a Western need for exoticism in setting and behaviour. An even more extreme example of this syndrome is the popularity of *rebetika* music, in some non-Greek circles as well as among the Greek middle class. The culture of drugs and crime reflected in *rebetika* lyrics brings a dangerous whiff of the Middle Eastern bazaar and hashish den which is clearly attractive to the many upright citizens who collect the recordings. Such concentration on the countryside and the underworld of Greece easily leads, of course, to a reductionist view of the country's culture.

Some of Greece's cultural development has been strongly influenced by the diaspora. The most obvious example is Constantine Cavafy, an Egyptian Greek and one of several

prominent Greek poets who have been bilingual. Cavafy's English reading took him outside the traditional framework of Greek literature and encouraged him to speak of Greek tradition from an unconventional diaspora viewpoint. Cavafy adds to the aesthetic of diachronic reference discussed above an extra frisson of pleasure derived from cultural mixture and ambiguity, in which he finds an obvious affinity between the Egypt of his own day and the Hellenistic kingdoms and Eastern Roman world deriving from the empire of Alexander the Great. On other levels, recordings of *rebetika* from the US diaspora added considerably to the vogue for that music, while Maria Callas benefited from her status as an American immigrant, which gave her an easy choice of career paths inside and outside Greece.

Greece's political instability in the 20th century has also influenced its cultural development and the reception of that culture outside the country. In particular, for most of the 40-year period between the establishment of the Metaxas regime in 1936 and the fall of the Colonels' Junta in 1975 much of the intellectual and cultural establishment of the country found it hard to identify with the Greek (or, for a time, German) authorities in Athens. It was not only a question of political disagreement, but of a total rejection of those governments' legitimacy. Many cultural figures went through periods of silent protest or silence enforced by censorship: the publishing history of a poet such as Ritsos is, as a result, very disturbed and complex. Much cultural production was aimed at foreign markets, to be circulated abroad so as to put pressure on the Greek government via foreign public opinion, and often was to be published abroad for clandestine circulation in Greece. One prominent example, Vasilis Vasilikos's documentary novel Z about the murder of the left-wing politician Grigorios Lambrakis in May 1963, was successfully published in several European languages. The French film of the same name by Constantin Costa-Gavras was even more effective in raising consciousness abroad about the crude methods used on the Greek front of the Cold War. During the 40 years of political alienation and especially towards its end, during the Junta period, affirmations of Greekness and poems of protest by some of Greece's greatest poets were set to music by Mikis Theodorakis and (later) Manos Hadjidakis. This made their names widely known in anti-authoritarian circles throughout the world. The result was a genre of power and originality, combining incisive lyrics with popular music from many Greek sources written by composers of great conventional talent. It had some success in focusing anti-Junta sentiment, as was acknowledged by clumsy attempts to ban the circulation of the songs. Greek culture was achieving recognition, in part, as a result of Greece's political weakness.

However the major political role of Greek culture in the 20th century has been rewarded by many international honours, and is one of modern Greece's proudest achievements. When the Great Idea came to grief in military defeat in Asia Minor, the burning of Smyrna, and the exchange of populations, the country lost the expansionist ideology that had guided it for the first century of nationhood. Against the power of resurgent Turkey, further widening of the borders would be all but impossible, and the Greek populations were no longer in Asia Minor to provide the motive and justification for that expansion. Rather unexpectedly, the closest thing to a replacement ideology was provided by the cultural leaders of the Generation of the 1930s, especially the poets. The prime mover was George Seferis, who seems to have had a programme of regeneration in mind since the early 1930s. His ablest contemporaries proved to be Odysseus Elytis, who began with poetry of the Aegean sea and beaches strongly influenced by Surrealism, and Yannis Ritsos, whose early poetry in favour of a very Moscow-aligned Communism was written in socialist realist mode, but soon changed to include traditional Greek genres.

During the 1940s Greece lost control over its destiny. After rule from Berlin during the Nazi occupation, the country narrowly missed during the Civil War what might have been domination from Moscow, only to fall victim to what many called control from Washington. There was a natural reaction in the 1940s and 1950s towards the exploration of Greekness as an independent alternative to subjection to competing blocs, and a series of poems and critical essays were written that may be read as a struggle of different political and cultural forces to lay claim to the diachronic Hellenic ideal – Seferis, whose views were the most significant because first expressed, combined a demythologized version of the ancient world with some Byzantine symbols, some writers in katharevousa who may be constructed as popular, a limited number of demoticist poets, and some visual artists working in a naïve vein. The whole remains to this day the most influential construct of the national identity – though there is a persistent complaint that it has an anti-intellectual tendency. Elytis and Ritsos too wrote many poems providing Greekness with a definition largely compatible with that of Seferis. The popularity of their poems was greatly increased by their setting to music. The contributions of these three poets to filling the vacuum of Greek ideology made them giants in literary terms. Seferis and Elytis were awarded Nobel Prizes for literature; the communist Ritsos, whose nomination for the Nobel Prize could not be easy in Cold War Greece, received equivalent Moscow prizes. Subsequent Greek poets, whatever the quality of their work, have not been called upon to reconstruct the national psyche, and so seem pygmies by comparison.

But there is a danger in measuring success by international acclaim. Several areas of Greek cultural production have been extremely active and successful by any measure apart from the haphazard forces of foreign recognition. One example is the theatre, which has a pervasive presence in every corner of the Greek urban world. There are considerable numbers of serious, ground-breaking Greek works to set beside the ubiquitous translations of foreign plays at every level and high-profile traditional farces. Greek painting has filled the country's major galleries with works that cover in most creative ways every facet of the Greek identity sketched above, and others that are not so easily categorized. Greek architecture, often the butt of criticism because it has filled the cities with concrete blocks of flats, has many achievements to boast in cases where it is able to escape from such straightjackets. The Greek novel, whose international success pales before that of Greek poetry, has shown great inventiveness in the exploration of contemporary Greece and the Greek heritage. Greek novelists have, particularly more recently, shared in the same developments as their counterparts in other literary traditions

and made similar experiments in areas conventionally labelled as postmodern.

Greece is a country with a small population, slightly increased by the addition of the diaspora. Its cultural production is much more diverse and vigorous than these numbers might be expected to support. Greek culture has often been recognized outside Greece, but sometimes for haphazard and even negative reasons, including geographical marginality, political instability, and its marking of forced and rapid ideological change. Within its natural Greek audience, that culture has been specially concerned with the exploration of different facets of the Greek identity and their imaginative combination and recombination into new and exciting constructs, which provide a variety of angles from which to view the Greek present. Some artists and poets have played significant roles in expressing the Greek view of themselves and their place in the world, at the most fundamental levels. It is this experimentation that is the major defining characteristic of the country's cultural production. In a global village where identity is constantly in question, and where different elements of the Greek past are used in this quest in many parts of the world, Greek culture has a strong claim on international attention.

Summary

Dated from 1821 to the present, the cultural history of the modern period has been dominated by the struggle to find a recognizable Greek identity and an acceptable form of the Greek language. The events of 1922–23 resulted in a remarkable degree of national homogenization inside the newly established borders. In their wake there have been striking developments in Greek literature, music, and the visual arts.

Moisiodax, Josephos *c.*1725–1800

Intellectual of the 18th century

Josephos Moisiodax was a towering cultural and social critic within the Greek Enlightenment, though his life, on the basis of surviving evidence, can only be partially reconstructed. He was born around 1725 at Czernawoda, a village today in southeastern Romania. Moisiodax was not ethnically Greek, but a Hellenized Vlach. Yet, his education in Thessalonica, in Smyrna, and at the Athonias Academy under Evgenios Voulgaris was entirely Greek. Moisiodox wrote and published solely in Greek. He is thus a typical example of the effect of the supra-national dissemination of Hellenic culture in the Balkans during the 18th century, which was not bound to a particular state and had a homogenizing impact upon the orientations, values, and perceptions of Balkan peoples.

Moisiodax continued his studies in physical sciences at the University of Padua, while he preached at the Greek church in Venice. There he published a Greek translation of Antonio Muratori's *Moral Philosophy* (1761) with his own prolegomena including his pleas for a Greek revival on the basis of the Enlightenment. Upon returning to the Danubian principalities, Moisiodax taught mathematics and physical sciences at the Princely Academy of Jassy in 1765–66 and later in 1776–77, where he also transmitted the ideas of the Enlightenment. His innovative teaching met with the unfavourable reaction of traditionalist teachers and circles, which forced him initially to resign and later to travel from 1777 to 1781 in various cities of central Europe (e.g. Budapest, Vienna, Venice). During this period he published four of his books. One of them, entitled *Pedagogy or Treatise on the Education of Children* (1779), was influenced by John Locke's pedagogical views and pointed out the interconnection between education and social practice and values while criticizing the backwardness of Greek education and its social background. In 1780 he published in Vienna his most important book, the *Apology*, which had a self-revelatory character and contained various texts and manifestos as responses to his ideological opponents and their accusations. In 1781 he also published a *Theory of Geography*, which comprised all major scientific discoveries including the heliocentric system. Scientific issues (e.g. the tides) were also discussed in his last book, *Physiological Notes* (1784), which was directed against the false perceptions of the ignorant masses concerning natural phenomena.

Moisiodax showed a particular predilection for discussing vital issues of his day including those concerning pedagogy, natural sciences, mathematics, and philosophy. One of the major contributions of his *Apology* to Greek thought was the undermining of traditional philosophy and its abstract, metaphysical concerns. Moisiodax supported wholeheartedly Cartesian rationalism and an empirically oriented scientific research as well as its achievements (e.g. Newtonian philosophy). Profoundly influenced by the Enlightenment's optimism, he stressed incessantly the social utility of science in terms of its technical applications. He also demonstrated that the preservation of the neo-Aristotelian status quo in Greek school curricula was motivated by socioeconomic reasons and personal interests. By supporting the outdated neo-Aristotelian system, conservative teachers tried to cover up their inabilities

and ignorance of modern developments. As a result, they feared losing their privileges and influence within the educational system and society. Their reaction to the innovators like Moisiodax was not due to sincere scholarly interests and a quest for the truth, but to selfish and base motives. This constituted a major aspect of Moisiodax's fierce and uncompromising sociocultural criticism, which brought him many conflicts in the course of his life and eventually disappointment and frustration. His last years in Bucharest until his death in 1800 are generally marked by silence, despite his short teaching period in 1797 at the Princely Academy there.

Moisiodax applied the important intellectual conflict in 17th-century Europe between the Ancients and the Moderns to the Greek case. Due to his infatuation with modern science and progress, Moisiodax criticized the backwardness of Greek society in comparison to the West and tried to modernize it by suggesting far-reaching changes in many domains on the basis of modern European developments. In this context he also envisaged a political reform from arbitrary despotism to a liberal and law-abiding republican regime of civic rights, such as the Swiss Commonwealth, which would be in a position to carry out such radical reforms. In this way Moisiodax became a chief advocate of social and cultural reform as the most pressing need of the day. He was also very critical towards various authorities which might have hindered Greece's future development. He did not restrain himself from criticizing his eminent teacher Voulgaris on various issues including his teaching method, although he acknowledged Voulgaris's unusual intellectual capacities and his numerous contributions. Moisiodax was also a pioneer in using the vernacular instead of an archaic dialect in his lectures and writings, thus making them easily accessible and comprehensible to a wider audience.

Without being antireligious at all, Moisiodax, who early in his life had taken holy orders, tried systematically through his works to wrest ideological power from the Church and to undermine its authority in matters pertaining to science, culture, and history. He was convinced that humans through education and rational enquiry could master the world surrounding them. Religion had to be confined to things pertaining to the mystical, supernatural realm, the salvation of the soul, and moral conduct, issues lying beyond the grasp of science. Likewise, the Bible had to be considered solely as a religious text and never as a scientific treatise. The importance of Moisiodax's points can be captured by taking into account the vivid ideological conflicts concerning the Copernican world system around the end of the 18th century in Ottoman Greece. Moisiodax, with his social critique, tried to liberate Greek thought from superstition and prejudice, which were often connected with traditional religious notions. Finally, Moisiodax – unlike his teacher in Smyrna, Ierotheos Dendrinos, and several other Orthodox – did not think that studying in western Europe at that time could pose serious problems to the preservation of the Orthodox faith due to the potential espousal of western Christian or atheistic views. In his opinion the many-sided contacts of the Greek world with the West, its cultural evolution, and its scientific progress did not impinge necessarily upon its Orthodox identity. Westernization was thus not coterminous with an abandonment of Orthodoxy. Such and similar arguments were quite usual among many bearers of Enlightenment ideas. In this way they intended, on the one hand, to legitimize their closer contacts with the West and, on the other hand, to neutralize the reactions of traditionalist Orthodox and other conservative circles.

In short, Moisiodax can be hailed as an architect of Greek ideological innovation during that important period of intellectual transition under the influence of the Enlightenment. His articulate socio-cultural criticism had a decisive influence upon other bearers of Enlightenment ideas, who continued his pioneering work.

Moldavia

Moldavia was founded by Vlach immigrants from Hungary under the legendary Dragosh Bogdan in the first half of the 14th century. Until that time the Moldavian lowlands were still held by Tatar tribes. In 1372, in an agreement between emperor Charles IV and king Louis of Hungary, the *voievozi* of

Moldavia was recognized as a dependency of the crown of St Stephen (of Hungary). Rival claims by Poland and Hungary were a constant source of conflict between the two kingdoms. This rivalry was laid to rest in 1412 in an agreement between emperor Sigismund, acting as king of Hungary, and the Polish king Ladislas II, which provided for the joint Pologno-Hungarian defence of Moldavia against any Turkish invasion and its subsequent division between the two allies. While Polish influence was in the ascendant during the first half of the 15th century, during the long reign of Stephen the Great (1457–1504) Moldavia was consolidated as an independent principality. He defeated three Turkish invasions in 1476, 1478, and 1484, and the Polish invasion of 1487. In the following year he himself invaded Poland and annexed the Polish province of Prokutia. Under Stephen's reign Moldavia, excluding Prokutia, extended from the river Milcovu on the border with Wallachia to the river Dniestr; it included the Carpathian region of the Bukovina (Slavonic "the beech-wood"), the Budzak (Turkish "the corner", the later Bessarabia), Chilia (Russian Kiliya), and Moncastro (Russian Byelgorod; Turkish Akkerman; Romanian Cetatea Alba) as well as the left bank of the Danube from Galatz to the Sulian mouth. The country was predominantly Eastern Orthodox in religion, dependent on the patriarchate of Ohrid; the official language was Slavonic; the title of the ruler was *Nachalnik i Voievoda Moldavlasi* (prince and duke of the Moldavlachs), and the succession was strictly hereditary.

Stephen's successor, Bogdan III ("the One-Eyed"), sought to alleviate the country's position between Hungary and Poland through an alliance with the Ottoman empire, which was already surrounding Moldavia on the Wallachian and Crimean frontiers. In 1513 Moldavia became a tributary to the Turks. From now on Turkish influence grew steadily; so much so that in the mid-16th century *voievod* Elias (1546–51) converted to Islam in an effort to appease the sultan.

It was at this time that the curious interlude of Jacob Basilius took place. Basilius was Greek by birth. The adopted son of Jacob Heraklides, the despot of Paros, Samos, and other Aegean islands, he was a well-educated man, a student of astronomy, who corresponded with Philip Melanchthon, the divine and who wrote historical works dedicated to Philip II of Spain. Above all he was an ambitious man. His succession to his stepfather's title left him unsatisfied, and he produced the fabricated claim of kinship with the Moldavian *voivode*. Supported by emperor Ferdinand, and with Hungarian aid, he routed the superior Moldavian forces in 1561 and deposed the *voievod* Alexander Lepasheanu (1552–61 and 1563–68). He even purchased Turkish confirmation of his usurped title. Shortly afterwards he assumed the new title of *basileus moldavias*. Jacob Basilius was an energetic educational and religious reformer, but his orthodoxy remained suspect, and when he levied a new tax on the population the *boyars*, the indigenous nobility, rose against him and killed him in 1563.

The last uprising against continued Turkish encroachment upon Moldavia occurred during the brief voievodate of John the Terrible (1572–74). After his defeat Turkish influence became ever more dominant. The *voivode*, or *hospodars*, were appointed and then deposed in quick succession, although prince Vasilie Lupul (Basil the Wolf) tenaciously clung to power for some 20 years.

Moldavia was devastated in the successive wars of the Polish king Jan Sobieski against the Ottomans. After Sobieski's death in 1696, Moldavia turned to the rising Russian power for protection. In 1711 the *voievod* Demetrius Cantemir concluded a secret agreement with tsar Peter the Great by which both countries committed themselves to a war against Turkey, after which Moldavia was to become a vassal state under Russian protection. Cantemir's troops, however, deserted in the face of the advancing Turks and the Russian campaign failed. Ottoman influence was now supreme. The Sublime Porte farmed out the hospodarship to a succession of wealthy Greeks, mostly from the Phanar quarter of Constantinople. The chief families that held the office during the so-called Phanariot regime were the Mavrokordato, Ghica, Callimachi, Ypsilanti, and Murusi. The *hospodars* thus installed were mere puppets dangling from strings pulled at Constantinople; and having to expend a large tribute, or *bakshish* ("tip"), every three years, and a smaller one every year, to have their appointments confirmed, they regarded their tenure of office largely as an opportunity for exploitation. At the same time, however, the Phanariot regime also brought about a significant educational improvement in Moldavia, especially under Gregory Ghica (1774–77).

Since the mid-16th century Moldavia's independence had been steadily eroded. The Russo-Turkish War (1768–74) delivered a fatal blow to the country's integrity. The Treaty of Kutchuk-Kainardji, of 15 July 1774, which ended the hostilities, restored Moldavia and Wallachia to the Porte but reserved for Russia the right to interfere in the affairs of the Danubian principalities. It was the beginning of Russia's advance on the Balkan peninsula. Moldavia's integrity, however, was infringed by Austria, which annexed the Bukovina in 1775. In 1802 Russia forced the Porte to accept further restrictions on Turkish suzerainty over Moldavia which amounted to a de facto Russian protectorate. During the next Russo-Turkish War (1806–12) Moldavia and Wallachia were occupied by Russia. The Treaty of Bucharest of 1812 restored the two principalities to Turkey under the previous stipulations. Bessarabia, however, was ceded to Russia. The river Pruth was now Moldavia's new border.

During the period of the Russo-Turkish wars a new Greek movement was formed in Moldavia. Around 1780 Rigas Velestinlis, a Hellenized Vlach from Macedonia, also known under the Greek name Rigas Pheraios, founded in Bucharest the *Hetaireia ton Philon* (the "Friendly Society"), a Greek patriotic and revolutionary association. Gradually the Hetairist movement gained substantial influence in Moldavian affairs. In 1810 the metropolitan of Wallachia, Ignatius, founded a Greek literary society that soon turned into a political movement. Many similar bodies sprang up in Moldavia, finally to be merged into one secret society, the *Hetaireia*. The political aims of the movement were only vaguely defined, suffused however with the ideas propagated by the French Revolution. In its more extreme forms it aimed at the restoration of the Byzantine empire.

The year 1821 marked the apogee of the Hetairist movement. Alexander Ypsilantis, son of a Phanariot *voievod* and an aide-de-camp to tsar Alexander I, entered Moldavia at the head of the Hetairists. But both the movement and its leader had become too closely associated with the Phanariot past.

Opposed by the indigenous Slav majority, lacking support, and eventually even repudiated by Russia, Ypsilantis's adventure ended in failure. His forces were crushed by the Turks and Moldavia was occupied by a Turkish army until 1824. The Russo-Turkish convention of Akkerman of 1826 and the peace treaty of Adrianople of 1829 confirmed the privileges of the Wallachian and Moldavian principalities. Their internal constitution was governed by the "Organic Law" which largely maintained the feudal position of the *boyars*. Socially, financially, and politically Russia was now the predominant influence in the two Danubian principalities. Between 1834 and 1848 their secret but all-powerful ruler was the Russian consul-general at Bucharest.

The European revolution of 1848 also reached Moldavia where it aimed at the overthrow of Russian influence institutionalized in the "Organic Law". The revolution was squashed by a joint Russo-Turkish intervention; and the "Organic Law" was restored. At the Treaty of Paris, which marked the end of the Crimean War in 1856, both Wallachia and Moldavia were restored under the suzerainty of Turkey but now collectively guaranteed by the great powers of Europe; they were granted complete internal independence from the Sublime Porte; and Bessarabia was restored to Moldavia. In September 1857 a European commission, instituted by the Paris peace treaty, prepared the way for a union of Moldavia and Wallachia under the name of Romania, to be governed by a foreign European prince. The merger of the two principalities came into force in January 1859.

Monarchy

The political landscape of the Mycenaean period consisted of independent powers of different size with a palace as their political and economic centre. The head of each palace and its surrounding territory was a king (*wanax* in Linear B) whose power was based on his control of the palace economy and his military leadership. It has also been assumed by scholars that the king was the high priest of his realm and thus also had a prominent cultic function. His power seems not to have been unrestricted, however, since he had to consider the demands of a strong aristocracy.

To a certain extent the societies of the Homeric epics resemble the Mycenaean world. Essentially an aristocratic world is depicted, though the terminology for the leading authorities is not absolutely consistent. Basically a single ruler and a council of noblemen have to be distinguished. The designation *basileus* for the noblemen obviously derives from the Linear B word *qasireu/pasireu*, which describes an official with certain limited powers. In contrast the *basileis* of the Homeric epics form the leading group of a community. The translation of the word *basileus* as "king" may be misleading at this stage; the terms "leader", "lord", or "chief" correspond better with the actual connotation. The *basileis* of the Homeric epics are distinguished from the other people by certain conditions. They are members of the leading families, which implies that they descend more or less directly from a god and that they had a profound material basis. Within this group of *basileis* there existed a code of virtues, the most prominent of which are courage, wisdom in council, and piety. Adherence to these virtues determined the actual status of a *basileus*.

Whereas the term *basileus* is often used in the plural, the denomination *anax*, which derives from the Linear B word *wanax*, is exclusively used in the singular form, thus implying some sort of monarchical power. The word may be translated as "master" or "prince". In each community, whether within the Greek army at Troy or in the smaller principalities, there exists just one *anax*. The *anax* himself is also a *basileus*, that is a nobleman. The *anax* fulfils a number of functions within the community: he is responsible for sacrifices; he is the commander-in-chief of the army; and he administers justice, thus combining sacral, civil, and military roles. His powers are not unlimited, however, since he has to consult the council of *basileis* on important questions. Although the actual status of the *anax* depends on his adherence to virtues, his position, being basically hereditary, is never seriously contested.

In the Archaic period the reality and the terminology of monarchy experience a considerable development. First, on the island of Cos, the term *monarchos* appears to become fixed quite early in the Archaic period to describe the phenomenon of a single magistrate ruling the polis. Second, and more important, the Greek world in the 7th and 6th centuries BC experienced the phenomenon of more or less unrestricted monarchs ruling a polis. The term *tyrannos* for these monarchs derives from the Anatolian languages of western Asia Minor. The prototype of a tyrant was the Lydian Gyges who in the early 7th century BC came to power by usurpation. The Phrygio-Lydian term can be translated as "chief" or "master".

While the word *tyrannos* was absent from Homer and Hesiod, archaic poets, especially Solon, Theognis, and Alcaeus, contrasted it to the denomination *basileus* as actually expressing the opposite of aristocracy: the monarchical power of a tyrant contradicted the claims of the aristocratic class for equality (*isonomia*) among themselves. The tyrant, as a member of the leading group which consisted of *basileis*, aimed at monarchical power, thus opposing the values of his class. This opposition to the values and virtues of aristocratic society

was called *hybris* (presumption, insolence). In the Archaic age therefore to be a tyrant meant being in the possession of monarchical power, but not necessarily being a violent despot. That meaning of the term developed in the course of the experience of violent rule of tyrants and within the theoretical discussion of the Classical period.

Whereas tyrannies, especially in Ionian Greece, continued to proliferate under Persian rule, in mainland Greece they had mostly disappeared by the end of the 6th century BC. In the 5th century BC some monarchies existed at the fringes of the Greek world, in Macedonia, Epirus, and Aetolia. In central Greece with the growth of democracy and in the aftermath of the Persian Wars a negative view of monarchical power prevailed: it was regarded as a form of government fitting slavish barbarians, not the free citizens of a Greek polis. Sparta had had a double kingship since Archaic times, but for the limited power of these kings the term monarchy is not really appropriate.

The movement of the Sophists stimulated theoretical discussions about different forms of government. It was in this context that monarchy began to be regarded at least theoretically as a good form of government. The rise of new monarchies in the Greek world in the 4th century BC and especially the growing power of the Macedonian monarchy under Philip II stimulated a wide-ranging discussion on the basis of the terminology of the Sophists. The discussion is well reflected in Aristotle's *Politics* (3. 14–18, 4. 10). Theoretically monarchy could have a good form, *basileia*, and a bad one, *tyrannis*. The shift of meaning since the Archaic period is noticeable. The main criterion for *basileia*, to be translated here as "royalty" or "kingship", was to rule according to the law and for the benefit of the subjects. Against this, tyranny meant the usurpation of power to rule for one's own benefit.

In the 4th century BC several treatises on kingship were written, sometimes aimed at particular kings, e.g. the "Cyprian orations" of Isocrates to Nicocles. In those treatises the picture of an ideal king was developed. A common model of an ideal king was the Persian Cyrus about whom Xenophon's treatise *Cyropaedia* has survived. Plato developed the concept of the philosopher king possessing absolute knowledge and goodness. Treatises of the 4th century BC have some basic features in common. Essentially the ideal king is portrayed as ruling for the benefit of his subjects which requires him to be generous, to be a military figure, and to be very pious.

Monarchy became the predominant political feature in Greece after the conquests of Philip II and his son Alexander the Great. After his conquest of central Greece Philip became the leader (*hegemon*) of the Corinthian League. It has to be remembered that the constitutions of the Greek cities remained unchanged. With Alexander the character of Greek monarchy changed considerably. After his conquest of Babylon in 330 BC he assumed the Persian title "king of Asia" and tried to model his royalty on Persian kingship, but he met the resistance of his Macedonian companions. Eventually his monarchy turned out to combine Persian and Macedonian elements and some new characteristics. The most important new feature was the order to the Greek cities in 324 BC to grant him divine honours, which was inspired by his achievements as conqueror and his unlimited monarchical power.

After Alexander's death in 323 BC and the wars of the Successors the Macedonian rulers of his divided empire in 306–304 BC assumed the title *basileus* themselves. By this time, royalty had become primarily dependent on military conquest. The ability to lead an army decided the royal status. Like Alexander, the Hellenistic kings regarded their territory as spear-won land and thus as a personal possession. The other predominant prerequisite of royalty was wealth. The nuclei of the Hellenistic monarchies, as with the Macedonian and Persian monarchies, were the companions (*philoi*) of the king, a group of nobles who together with the army formed the royal establishment. "King, friends, and army" was a common phrase in Hellenistic times.

Apart from these common features the Hellenistic monarchies had considerable differences. These primarily depended on the traditions of their subject peoples and the structures of their empires. The Ptolemies in Egypt established themselves in the tradition of the pharaohs. The Seleucids, who reigned in Syria, but whose empire at its peak stretched as far as India, had many different traditions to cope with. In general they showed piety towards indigenous gods. Both the Ptolemies and the Seleucids received divine honours from the Greek cities. They were honoured as liberators of the cities, as founders, or as benefactors. The cults could be for the worship of the living ruler or of his dynasty. In contrast the Antigonids in Macedonia did not receive divine honours.

In the Hellenistic period a wide range of treatises on kingship were written. Like their predessessors of the 4th century BC, they were mostly aimed at particular rulers. Most of the treatises are lost, but a good insight is provided by the 3rd-century BC *Letter of Aristeas* and the Neopythagorean writers Ecphantus, Diotogenes, and Sthenidas. The virtues and achievements of a king according to these treatises are military leadership, generosity, philanthropy, wealth, justice, security, and peace.

With the battle of Actium in 31 BC the last Hellenistic monarchy fell, and for 360 years the Greek world was ruled from Rome. Many traces of Hellenistic monarchy may be observed in the Roman principate. With the establishment of Constantinople as capital of the eastern Roman empire and the final division of the empire in AD 395 the circumstances of monarchy in Greece changed considerably. The emperors regarded themselves as Romans and Christianity was the imperial religion. The official ideology of the emperor consisted of his being chosen by God as lord over the world, as his vicar on earth. The way to power was usually by usurpation: when the usurper was successful, this meant he was chosen by God. Thus, as in previous periods, military victory was one of the determinants of imperial status, both internal and external. The title *basileus* was introduced in 629 as the official style of the Byzantine emperor by Herakleios after his victory over Persia in memory of Alexander the Great's conquests. The 10th-century *Suda*, referring to Philip II and the Successors, makes the ability to lead an army the most important virtue of the *basileus*. Victories were celebrated very extensively and the Christian cross became a sign of victory.

In theory the emperor had unlimited power. He was the commander-in-chief, the supreme judge, the sole lawgiver, the protector of the Church, the guardian of the faith, and he made decisions over war and peace. In practice he had to take into consideration factions at court and in the Hippodrome of Constantinople, where the people expressed their consent or

dissent through acclamation. Until the final capture of Constantinople by the Turks in 1453 the Byzantine court was the centre of the empire. The ceremonial at court was essential for the determination of the palace hierarchy.

An important feature of the Byzantine period is panegyric, the praise of an emperor. Through the criticism or the depiction of an exemplary king, often chosen from the Greek or Roman past, the emperor could be given to understand what was expected of him. There was a wide range of imperial virtues such as courage, justice, temperance, wisdom, and clemency. Such virtues could be categorized as physical, intellectual, and moral skills. Most of these features are derived more or less explicitly from 4th-century BC and Hellenistic treatises on kingship. The focus on individual virtues could vary. Although there was always criticism of particular rulers, the monarchical system itself was never questioned during the Byzantine period.

In the Greek War of Independence monarchy played a minor role. The independence movement was influenced by ideas of the Enlightenment and the French Revolution. To be considered in this context is the Great Idea (*Megali Idea*), which aimed at the reconstruction of the Byzantine empire, but here also the idea of monarchy was of minor importance. Contrary to Greek draft constitutions, Russia, France, and Britain in 1833 made Otho of Bavaria king of Greece. He wielded absolute power, regarding himself as being king by divine grace until 1843–44, when he was forced to accept a constitution that was upheld as a treaty between king and subjects. After the revolution of 1862 the principle of the sovereignty of the people was introduced. But prince George I of Denmark was appointed by the Great Powers as king of the Hellenes. The Asia Minor disaster of 1922 dealt a severe blow to the monarchy and was followed by a period of republican rule (1924–35). A rigged plebiscite enabled the king to return in 1935 and apart from wartime exile the monarchy survived until 1967, when a military junta assumed power. The monarchy was finally abolished by a referendum in 1974.

Monasteries

Monasteries consist of a building or group of buildings housing monks or nuns who live as a community, apart from the world, in prayer and work dedicated to God. They vary in size, accommodating a minimum of three monks to several hundred. The term monastery (*moni*) refers to various types of ascetic houses. The ancient Greek terms *lavra* (a group of dispersed hermits' cells, *kellia*), adapted from the Greek word meaning a lane or passageway, and *koinobion* (community of monks or nuns) denote both the monks' mode of life and the architectural layout of the building(s).

The Greek monastic tradition originated in certain 3rd- and 4th-century ascetic dwellings in Egypt. By AD 350 three coexisting modes of ascetic life had emerged. The hermits (*eremia*, "desert") led solitary lives in huts or caves, and even in tombs. Following the example of St Antony of Egypt (251–356), some went to extremes by living in the branches of trees, or on top of pillars. The monks dwelt in the same house and followed the general cenobitic routine (*koinobion*) suggested by St Pachomius of Egypt (285–346) and St Basil the Great (329–79). In between these two ascetic lifestyles were groups of between three and six monks who led semi-eremitic lives under an elder (*geron*, "old man") of discernment and wisdom, a guide in spiritual matters. These monks dwelt in their houses during the week, occupied with prayer and manual labour, and attended the services in the church built in the middle of the monastic village (*lavra*) at weekends. Well-known *lavras* in Egypt included Nitria and Scetis (the modern Wadi Natrun), which had produced many outstanding monks by the end of

Monasteries: monk tending the gardens at the monastery of Pantokratoros, Mount Athos; the aim is self-sufficiency in food

the 4th century. Most *lavras* were in remote rural locations, but a few were in suburban and urban areas.

Byzantine monastic architecture also originated in Egypt and Syria. Its development mirrors the change from the *lavra* layout to the *koinobion* fortress, St Catherine's on Mount Sinai being a prototype. The typical *koinobion* had strong, defensive walls more than ten metres high, housing the monks' or nuns' cells, together with stables, workshops, storage buildings, and a tower. The main church (the *katholikon*) was in the centre of the courtyard, and the canopied fountain, the reservoir for holy water (*phiale*), stood in front of it. The refectory (*trapeza*) was in the courtyard opposite the church. The tower was built to defend the only entrance to the monastery, and served as the final refuge in case of raids by pirates and robbers. It also functioned as a storehouse for food, and as a library for important monastic documents, manuscripts, and books. Some of the towers had a small chapel at the top.

In the course of time, more monasteries were built in towns, notably in Constantinople, making monasticism an urban phenomenon. The accumulation of agricultural land and other properties provided the monks with food and an income to maintain the buildings and operate the monastery, and gave them an important role in the city's economy. The general form, rule, and variety of monasteries were complete by the birth of Byzantium.

Two foundation deeds (*typikon* and *brevion*) and certain imperial laws were implemented to regulate the rapid growth of monasteries and to "tame" them to serve both Church and society. The foundation charter (*typikon*) specified the rights and duties of the monks and nuns, with the proviso that they should pray for their founder and, after his or her death, intercede on behalf of his or her soul. The belief in the effect of prayer was often the main reason why benefactors founded new monasteries or supported existing ones. The *brevion* stated the founder's wishes regarding the litany, and listed all endowments. This effectively standardized the mode of life in the new communities.

The monasteries were classified as imperial, patriarchal (*stavropegion*), or episcopal, and as private or independent depending on the law that regulated them. The imperial houses were subject to the emperor or his representative, and the patriarchal ones were privileged to be under direct patriarchal control. Most were episcopal and under diocesan control. Some small houses were completely independent (*autodespotai*), albeit mostly connected and affiliated to farming lands (*metochia*). This network of ruling monasteries and dependencies was crystallized by the 9th century. Byzantine sources record more than 1000 monasteries, one third of which were located in Constantinople or its immediate surroundings.

Each monastery had a superior, *hegoumenos*, usually elected for life. His election was stipulated in the *typikon* and was normally confirmed by the diocesan bishop. The *hegoumenos* was responsible for the spiritual and temporal well-being of the monastery, and he commanded absolute obedience. Other officials included the steward (*oikonomos*), the sacristan (*ekklesiarches*), and a number of brethren responsible for the refectory, treasury, and archives.

This hierarchy emerged hand-in-hand with the development of monasticism from a lay movement to an organized cenobitic community. Initially there were only two classes of monks: the literate choir monks responsible for singing the daily offices,

and the uneducated servant brethren (*diakonetai*) doing manual labour. This division was reflected in their food and dress, their seating in the refectory, and even in their place of burial. When members of the nobility donned the habit, they were accompanied by servants. Having made substantial donations to the monastery, they dwelt in suites rather than single cells. Despite their vows of poverty, they were allowed to retain some personal property.

The monastery as an institution soon became an essential part of the social and religious fabric of Byzantium. The daily routine consisted of eight hours of prayer, eight hours of work, and eight hours of rest, not in succession, but intermingled with the liturgical hours of day and night services. The *hegoumenos* appointed each monastic to specific duties, making use of everyone's individual gifts. Most monks and nuns were occupied in agricultural and manual work, although some studied the scriptures, copied manuscripts, or composed hymns and hagiographical works.

In the early and late centuries of Byzantium there were double monasteries housing two separate but adjacent communities of men and women, under the same superior. The self-evident difficulties posed by such close proximity of monks and nuns made Justinian I (546) prohibit these institutions. The inefficiency of the legislation allowed double monasteries to exist from time to time. Around 810 patriarch Nikephoros I closed all double monasteries. In the Palaiologan period these monasteries were re-established, principally so that the family of the founder could remain close even after renouncing the world, but by the end of the 14th century these institutions were again closed down.

With Palestine and Sinai in Arab hands, the monastery of Stoudios in Constantinople, the heart of Byzantium, became the leading monastery for the Eastern Orthodox Churches. As its *hegoumenos*, St Theodore (759–826) made it a strong cenobitic community, by both practical example and written regulation. He defended the use of icons in the iconoclast controversy, and defined the role of monastic discipline in his *Catecheses*, modelled after the rules of St Basil. Stoudios soon became progressive and led the way in providing food for the poor, lodging for foreign pilgrims and commercial travellers, as well as homes for orphans and old people. The monasteries in Constantinople were the first to establish hospitals with employed doctors and male nurses.

In the 10th century Mount Athos succeeded Constantinople as the spiritual centre of Orthodoxy, and 20 ruling monasteries were established on the Holy Mountain in the next 500 years. These still own the entire peninsula, which is divided into 20 areas. All other monastic properties located on any of the land of the ruling monasteries are known as dependencies (*exartemata*): 12 monastic villages (*sketai*), several hundred cottages (*kellia*), and farming land (*metochia*). There are also various kinds of retreat known as *hesychasteria*, hermitages (*kathismata*), eremitic huts (*kalyves*), and ascetic huts or caves (*spilia*), situated on high cliffs at the southern tip of the peninsula. Only Great Lavra, the first and oldest of the 20 ruling monasteries, founded in 963, uses the term *lavra* in its name, thereby denoting the origin of Athonite monasticism. Today all the ruling monasteries are impregnable fortresses.

With the fall of Constantinople in 1453, Mount Athos became the last bastion of Byzantium and a haven for refugees, exiled bishops, and banished patriarchs. The Athonites played a significant role in the Christianization of the Slavs and Russians as far north as Karelia, the Kola peninsula, and the Petsamo monastery in Finland. During the Tourkokratia (1430–1912), the heavy ransoms and taxes imposed by the sultan forced many of the Athonite monasteries to adopt the idiorrhythmic system (*idios rhythmos*, "own way of life"). Each monk earned his own living through agriculture, icon-painting, or handicrafts. This individual lifestyle, which became common in the Palaiologan era (1261–1453), had a negative connotation throughout the Byzantine period, and this attitude has persisted until the present time. Since the 1980s, the idiorrhythmic monasteries have readopted the cenobitic system, one by one, Pantokratoros being the last in 1992.

Unlike western practice, education was never a function of Byzantine monasticism. Many *typika* specifically forbade the admission of children for educational purposes. Nevertheless, monasteries played an integral role in the intellectual and cultural life of the empire. Many of its most important literary figures were monks. The ability to read was essential from the very begining of monasticism. Literate nuns, for example, were encouraged to teach their illiterate sisters enough to chant the office, maintain the monastery accounts, and work as librarians (*bibliophylax*). Monks and nuns formed the majority of the empire's literati in the early 9th century, and about 25 per cent in the 14th century.

The Stoudios and Hodegon monasteries in Constantinople housed scriptoria producing, copying, and illuminating manuscripts, as well as composing hymns, saints' lives, theological treatises, and historical chronicles for both internal and external use. Most monasteries had librarians who looked after the scriptures, liturgical books, and works on hagiography, patristics, and theology. The librarian was also responsible for the selection of texts to be read in the refectory during mealtimes. Only a few monasteries had any manuscripts or books by ancient Greek authors, although some did benefit from the personal book collections of their founders. The Chora library in 14th century Constantinople was the best in the capital, where the leading Classical philologists of the day prepared editions and commentaries on Classical authors.

When the Turks strengthened their hold on Asia Minor, monks and clergy fled to Patmos, which became an intellectual centre that was also culturally and artistically linked with Crete. The monks founded the celebrated Patmian School in 1713. It soon became the centre of Orthodox higher education in the Greek-speaking world, but fell into decline within 40 years. The curriculum included Latin, rhetoric, philology, and religious studies.

Efforts to keep learning and literacy alive were also made on Mount Athos. The librarians at the Vatopedi monastery in particular, notably Maximos the Hagiorite (b. 1480) who had travelled widely and studied in Paris and Italy, were conscious of the inestimable value of the library collections. The Athonites jointly bought the splendid library of Michael Kantakouzenos, one of the wealthiest men of the period, in 1578.

In the 18th century Nikodimos of the Holy Mountain, known as "the Hagiorite" and "the encyclopaedia of Athonite learning", contributed significally to the era of spiritual awakening by compiling and editing the *Philokalia*, the fundamental anthology of mystical and ascetic texts written between the

4th and 15th centuries. Despite the Athonites' anti-intellectualism and suspicion of western values, they founded the Athonite Academy near Vatopedi, the leading monastery on Athos at the time, in 1753. But its curriculum proved too liberal and it was soon closed, its buildings destroyed by fire.

The monasteries in the Byzantine and post-Byzantine periods have wielded immense power and, at times, caused serious problems for rulers. Since the birth of monasticism, the monks' supposed gifts of healing the sick, driving evil from people's souls, and foretelling the future have encouraged the laity to support the holy men and women devoted to the ascetic life. During the 4th and 5th centuries the monks played a major role in ecumenical councils. Since many monasteries were havens of refuge for people from all walks of life, from peasants to patricians, ex-teachers to emperors, many realized the significance of patronage. Eventually, many a ruler, more by force than choice, exchanged his purple robes for the black habit. Increasingly it became the custom to recruit bishops and patriarchs from the leading monasteries. Although the fortunes of the monasteries waxed and waned as the empire grew and contracted, even in difficult times there were always wealthy patrons, pious benefactors, and rulers who gave substantial gifts and landholdings. Justinian (527–65) granted monasteries special economic privileges that made them very wealthy. This became a serious problem for the empire in the late Byzantine period when nearly half of the land was controlled by monks. In the late 14th century, forced by the rapidly worsening state of the economy, the emperors attempted to redistribute the land in order to maintain the army. The monasteries resisted this strongly, which contributed to the fall of the empire, since Byzantium was threatened by enemies on all sides.

The Ottoman era and the many wars in the first half of the 20th century diminished the monasteries' influence over the religious life of Greece, resulting in a decline in the number of monks (from 150,000 in the 11th century to fewer than 3,000 today). This has left hundreds of monasteries deserted. Since the early 1970s, a modest but steady revival has been taking place, which is significant because it is not only pious peasants, but also educated young men and women who are entering monastic life in increasing numbers. Apart from Mount Athos, the most renowned are the monastery of St John the Theologian on Patmos, founded in 1088, and Meteora in Thessaly. The latter is a group of six monasteries – once 24 – established in the early 14th century, but today little more than museums. The Old Calendarist monastery of the Transfiguration at Kouvara and the monastery of the Paraclete at Oropos also house a healthy number of youngish monks.

Since the 1920s, the number of nuns has increased from a few hundred to 2,500. Nuns have taken over houses abandoned by men, including St Nicholas's nunnery on Euboea. The convent of the Annunciation at Ormylia in Chalcidice, a dependency of Simonospetras on Mount Athos, and the Kechrovouni convent on the island of Tinos, renowned as a pilgrimage centre, are attracting educated women in particular.

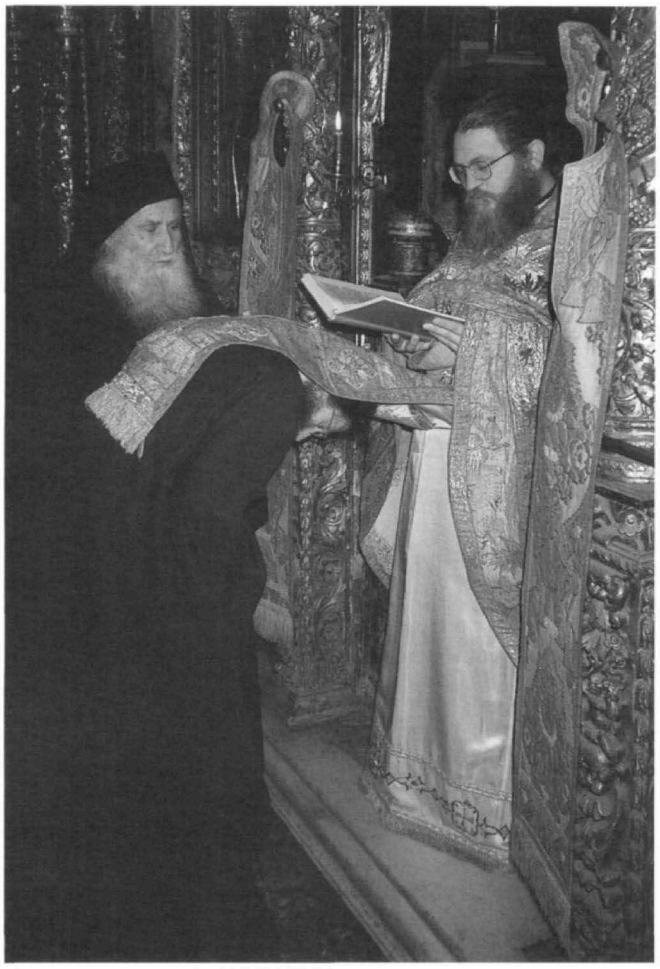
Monasticism

The rise of monasticism brought nothing essentially new into the early Church. It was a new expression of the same enthusiastic or eschatological dimension of Christianity that martyrdom had embodied in earlier centuries. Monastic life is, of course, not distinctively Christian, answering as it does to a deep, perhaps universal human instinct. Yet while Christian monasticism may have borrowed from, or may even present parallel practices to, other ascetic traditions – such as the notions of solitude and struggle, concentration and contemplation, passion and dispassion – these were not the reasons for its rise.

Rather, it was the dilution of commitment – when Christianity no longer constituted a question of life or death – that accounted for several factors in the early Church, one of which was monasticism. Following the Edict of Toleration (313), it was the monastics who assumed the responsibility of witnessing to the Kingdom, of reminding people that the Church is not "of the world" (John 17: 36). The "baptism of conscience" (asceticism) thus succeeded the "baptism of blood" (martyrdom), ideologically and chronologically.

We think of Antony and Pachomius in Egypt; Antony's disciple, Hilarion, in Syria and Palestine; Cassian (d. 432) and



Monasticism: a new monk is tonsured during the Vigil for the Nativity on Mount Athos

Benedict (d. 547) in the West; Basil and the Gregories in Asia Minor. Monasticism soon acquired a particular significance for all Christians. The *Life of Antony* (by Athanasius), the *Life of Paul of Thebes* (by Jerome), the *Lausiac History* (by Palladius) – these and similar texts rapidly became favourite reading in Byzantium.

In the 4th century Egypt, Syria, Palestine, and Asia were the forcing-ground where every kind of monastic life was experienced and experimented. The roots even of western religious life clearly lie in the Egyptian east, where monasticism began on a Sunday morning in the year 270 or 271. The Gospel of the day included the words: "If you want to be perfect, go and sell what you possess, give to the poor, and you will have treasure in heaven; and come, follow me" (Matthew 19: 21). In the congregation was a young man called Antony who, upon hearing these words, sought a life not merely of relative poverty but of radical solitude. Antony's step into the uninhabited desert was little noticed outside, or even inside, his village at the time. But when he died at the age of 106, as his friend and biographer Athanasius of Alexandria (d. 373) informs us, his name was known "all over the road". "The desert", he writes, "had become a city". Before retiring to the desert, Antony had placed his sister in a "home for virgins", a fact that perhaps reveals that women were organized into Christian communities earlier than men.

In Egypt there now appeared three main types of monasticism, roughly corresponding to three geographical locations: (1) the *eremitic* life, found in lower Egypt, where Antony was the model. Here monks lived an isolated and austere life of prayer and detachment in pursuit of evangelical perfection. This is the oldest and most rudimentary form of organization. (2) The *cenobitic* or communal form of monasticism, found in upper Egypt, where Pachomius (d. 346) was the prototype. Here monks prayed and worked together, in a lifestyle where the emphasis was now on the common life. And (3) the *middle way*, located in Nitria and Scetis where Amoun founded this monastic way around 311. Here a small and intimate family of monks looked to a common spiritual elder, or "abba". Since these "sketes" were also closer to the city, they became meeting places or crossroads between the world and the desert.

The focus of eastern monasticism moved from Egypt to Asia Minor in the late 4th century, to Palestine in the 5th, to Sinai in the 6th, and in the 10th century to Mount Athos, where these three types of monasticism are still in existence, bearing witness to a remarkable tradition of living continuity in the monastic life.

Other regions saw a variety of lifestyles: in Syria, for example, we find examples of "stylites", people who chose to live on pillars. Contemporary research reminds us that Syriac monasticism is at least as ancient as Egyptian, and developed quite independently; but in Syria there was no single model or founder like Antony. Elsewhere, in Cappadocia, a more learned, liturgical, and social monasticism appeared under the inspiration and influence of Basil the Great (d. 379). In Palestine the profound tradition of spiritual direction was established by Isaiah of Scetis (d. 489), Barsanuphius and John (both d. *c.*543), Dorotheus of Gaza (d. *c.*560), Euthymius (d. 473) and Sa[v]vas (d. 532). On Sinai a more silent, or "hesychast", spirituality was founded by John Klimakos (d. *c.*649) whose *Ladder of Divine Ascent* was so influential in the development of the Jesus prayer.

The remarkable growth of monasticism was also apparent in Churches outside the Byzantine empire: this is true of Ethiopia, where the *Life of Antony* and the *Life of Pachomius* were among the first books to be translated; it is also true of Mesopotamia, where the great organizer Abraham of Kashkar (d. 586) lived; it is furthermore true of Armenia, where monasteries such as Echmiadzin became active spiritual and cultural centres; it is true, finally, of Georgia, where monasticism was attributed to the "13 Fathers" from Syria.

Naturally, the flowering of monasticism was still more remarkable within the Roman empire. Egypt always remained an active centre, but already by 518 Constantinople numbered some 70 communities for men alone. Monks became increasingly influential in ecclesiastical and social life: they intervened in theological disputes; they informed liturgy and spirituality; they inspired the laity, who tended to follow the charismatic leaders of monasticism; gradually, even the order of the episcopate was restricted to monks.

The monks were always passionate in their defence of theological principles, and especially of the doctrine that in the person of Christ human and divine natures were reconciled. It was this doctrine that monastics pursued with such ferocious intellectual vigour and ascetic rigour in their own struggle to unite body and soul. In the mind of the monastics, mystical

theory and ascetic practice had a common vision. Theology and spirituality shared the same language. Union with God or vision of God (*theoria*) was made possible only through a life of spiritual purification and total renunciation, a self-stripping not only of material possessions, but even of intellectual projections. This was the way of negation, or of "apophatic" knowledge, whereby the unknown God was venerated through a series of negations that revealed God as "ever beyond". The apophatic approach was applied on the moral level (as purification from wrongful desires) as well as on the intellectual level (as a laying aside of worldly concepts and images of God).

Yet eastern monasticism in fact always manifested a greater degree of flexibility and a lesser emphasis on uniformity than religious life in the West. The Christian East never had someone like Benedict who would provide monastic life with a strict set of regulations or an order of life. Basil's "rules" are very different from the *Rule* of Augustine (d. 430) or of Benedict. And they are not nearly as systematic in form: his *Longer Rules* are a series of sermons on the monastic life, while his *Shorter Rules* are answers to questions raised by monastics as Basil visited the monasteries of his diocese. Even Theodore of Stoudios (d. 826), perhaps the greatest monastic authority after Basil, who instituted a significant reform during the 9th century, sought primarily to return to the early tradition of the East. His *Monastic Testament* by no means resembles the clarity and completeness of Benedict's writings. The entire development of the monastic communities on Mount Athos from the mid-10th century was based on Theodore. So there was no generally accepted rule or order. One simply became attached to a specific monastery with a particular tradition. The emphasis lay less on "stability" and more on "sitting in one's cell". In the *Sayings of the Desert Fathers*, Abba Moses (d. 407) reveals that "the cell teaches us everything".

The spirituality of the cell was inevitably connected to the life of silent prayer. And it was such prayer that constituted the primary social service of the Byzantine monastic. This is why, although some monastics existed in larger cities – Theodore's monastery, Stoudios, was in the centre of Constantinople – the classical notion of the monastery in the East was that it was situated in desolate areas, remote from civilization. Such deserted places were areas chosen for prayer: Mar Saba monastery in the Holy Land, St Catherine's monastery on Mount Sinai, the monastic republic of Mount Athos, and the rocks of Meteora in central Greece.

Any other service to the world was considered secondary, extrinsic to the essential vocation of the monk and nun. Their main purpose was prayer. And visitors to their monasteries expected to find places of prayer, to discover persons of prayer, and to encounter holy people with the gift of spiritual direction. In the West, monasteries often became nurseries of scholarship; but in the East, they were always centres of spirituality. In the West, at least by the 9th century, most monks were ordained; but in the East, Byzantine monasticism remained largely a lay movement, with only just enough priests in a given monastery for its liturgical needs.

Among the secondary or outward services of eastern monasteries were: (1) education – not as a scholarly skill, but as a manual labour for the more educated monastics. The monk was primarily a healer, not a teacher. (2) Evangelism – while few monasteries prepared monks for preaching, there were certain cases of individual monks who assumed this ministry (St Nikon in the 10th century and St Kosmas in the 18th century). (3) Spiritual direction – confessions were heard and advice was sought from monastics. This service is closely related to prayer. (4) Charitable work – there were examples of monasteries and many cases of monastics who performed this function of social welfare.

The most precious service of eastern monasticism was its ever-burning flame of prayer and spirituality. There was a monastery in Constantinople called "Akoimetoi" (literally, the sleepless ones), where prayer was ongoing, 24 hours a day, with monks taking turns to recite prayers.

The ideal in eastern monasticism always remained the life of the Spirit. Monastic life was an experience of charismatic enthusiasm, a Pentecostal reality. The monk was a "*pneumatophoros*" (Spirit-bearer), bearing witness to the abiding presence of the Spirit in the Church. One might even suggest that Antony and the less conspicuous monks of the Egyptian desert were, in a way, a more significant and lasting ingredient of the Byzantine tradition than many other cultural aspects held in such esteem by historians. More than any monuments and manuscripts, the Byzantine monastics – known and unknown – betray a mystical force and become icons, windows through which one is initiated into an entire tradition.

Monemvasia

Town in the southeast Peloponnese

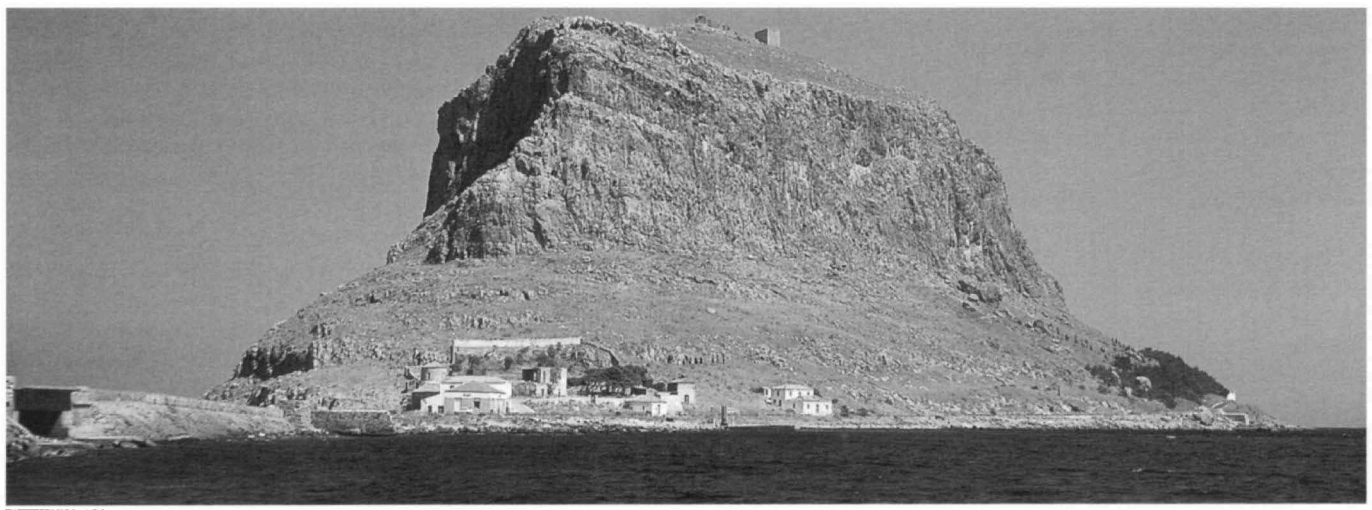
Monemvasia is a fortified town that occupies a towering and massively rocky coastal site in the southeast of the Peloponnese; it is joined to the mainland by a causeway which explains its name, which means "single entry". Its exceptional strength as a stronghold has dominated its history from its foundation, and accounts for its sobriquet, the "Gibraltar of Greece". Evidence of pre-Christian habitation here is minimal, but its foundation as a new town seems to have taken place in the later 6th century AD, and during the Slav invasions it became a place of refuge for the Laconians. There was already a bishop of Monemvasia by 787, probably a suffragan of Corinth; in the 10th century its bishop, called Paul, referred to the town as a *kastron*. The great natural strength of Monemvasia meant that its citizens were able to sustain a more individualistic stance in relation to external powers, and it was always to be the last outpost to fall to successive invaders.

The Monemvasiotes successfully repulsed an attempted Norman invasion in 1147, and it was not until 1248 that the Franks under William II de Villehardouin were able to capture the town, more than 40 years after they had subdued the rest of the Peloponnese, and then only after a two-year siege. Fourteen years later the Byzantines recovered it, when William, who had been taken prisoner at the battle of Pelagonia in 1259, had to cede four of his castles in the Morea as the price of his freedom. Thereafter Monemvasia remained in Byzantine hands until 1460, enjoying special trading privileges, which were renewed on several occasions, and with its metropolitan elevated by Michael VIII from the 34th to the 10th in the hierarchy of the whole Byzantine empire. Even the victorious sultan, Mehmet II, refrained from trying to take it while subduing the rest of the Peloponnese.

After a brief spell of four years' subjugation to the papacy, during which Pius II confirmed and renewed the city's trading privileges, Monemvasia became one of the many Aegean outposts of the empire of the Venetians, with their control lasting from 1463 to 1540, and again from 1690 to 1715. During the intervening years the town was subject to Turkish rule, which came to an end in 1821 with one of the earlier episodes of the Greek War of Independence. The Turkish garrison had capitulated after a four-month siege on terms that involved their being allowed to embark in vessels that would take them back to Asia Minor; such was the impregnability of Monemvasia that these favourable terms had been proposed by them, and accepted by the Greeks. The Turks were, however, attacked as they entered their boats to leave, and some were killed.

Two texts are associated with Monemvasia. One is the so-called *Chronicle of Monemvasia* written in the 10th century by a bishop of the town called Paul (mentioned above); the first publication of the work, which exists in four 16th-century manuscripts, all somewhat different, was in 1749. It describes events in the Peloponnese between the 6th and the 9th centuries, and recounts the abandonment of the region of Lacedaemonia and the foundation of a new town called Monemvasia. An added section covers some events from the 11th to the 14th centuries. The other text is in effect a forgery that was probably composed by a 15th-century metropolitan of Monmevasia, Makarios Melissenos; it is known as the *Chronicon maius* of Sphrantzes, since Melissenos used the *Chronicon minus* of the diplomat and historian as the basis of his work, expanding and elaborating it to include a range of extra material. The same metropolitan also forged an imperial decree of Andronikos II Palaiologos (1282–1328), which he stamped with a counterfeit seal, to establish (falsely) his rights in a territorial dispute in the Peloponnese.

The buildings of Monemvasia are divided between the Lower Town, entered through a massive fortified gateway, and the Upper Town or Kastro, reached up a steep path and itself heavily defended and with a long entrance tunnel. Of the 25 churches still to be seen in the Lower Town, 17 were either built or restored during the second period of Venetian occupation, of 1690–1715. Among them is the cathedral, which is the largest church in the province of Laconia, and dates from the



Monemvasia: the Byzantine town has been restored to provide holiday homes for wealthy Athenians

period when Andronikos II raised the town to metropolitan rank in 1293; it has the rare dedication of the Elkomenos Christou (literally "The dragging of Christ" [to the Crucifixion]), and it was largely renewed in 1597. An important icon of this subject was in the possession of this church, and was greatly coveted by the emperor Isaac II Angelos (1185–95), who had to employ deceit to obtain it; the large icon of the Crucifixion that is now in the Byzantine Museum, Athens, and which also came from this church, was probably one of a group of icons of the Passion that included the icon taken by Isaac II.

The Upper Town is still circled by continuous fortifications, and the highest point was dominated by a fortress of which ruins survive; by 1154 Monemvasia was said to have "a castle very high above the sea, from which one may look across to Crete", and these remains are no doubt a relic of this 12th-century stronghold. It was used by the Venetians as a powder magazine, and it exploded during a Turkish attack in 1589. But the most impressive building in Monemvasia is the church now known as Hagia Sophia; traditionally founded by Andronikos II, its plan follows the domed design of churches such as the *katholikon* (principal church) at Dafni near Athens, with the large cupola carried on an octagon of vaults giving maximum light and space to the area beneath. Until the 19th century its dedication was to the Theotokos Hodegetria.

By a curious irony, the form in which Monemvasia became best known in western Europe was not as one of the great natural European strongholds, but through the wine that was exported from here; this dark, sweet wine was known to the British by the name of Malmsey, and for the French *vin de Malvoisie*. Shakespeare's public would have recognized this association when the murderers of the Duke of the Clarence threaten him with drowning in a "malmsey butt" (*Richard III*, 1. 4).

PAUL HETHERINGTON

Summary

Perched on a massive rock on the southeast coast of the Peloponnese, Monemvasia has earned the nickname of "the Gibraltar of Greece". Perhaps founded in the 6th century AD, Monemvasia was not taken by the Franks until 1248 and was Byzantine again from 1259 to 1460. Mehmet II did not attempt to take it. It was in Venetian hands 1463–1540 and 1690–1715 and reverted to Greece in 1821. It is now being elegantly restored.

Monophysites

Monophysites believe that in the person of the incarnate Christ humanity and Godhead were united in a single nature, as opposed to the orthodox doctrine, which teaches that after the Incarnation Christ should be acknowledged in two natures, perfect humanity and divinity, each retaining its own characteristics but united in one being. The rift between orthodox and Monophysite emerged slowly after the Council of Chalcedon in 451, until by the middle of the 6th century the Coptic, Nubian, Armenian, Ethiopian, much of the Syrian and Persian Churches, and parts of the Church in Asia Minor were Monophysite. Their theology was inspired by Cyril of Alexandria (patriarch 412–44) and by the theologian and teacher Severus, patriarch of Antioch from 512 to 518. Monophysitism was to contribute to a sense of national identity among the Copts, Nubians, Ethiopians, and Armenians.

The distant origins of Monophysitism may be traced back to interpretations of John 1:14 ("The Word became flesh and dwelt among us"). No theological issue arose, however, until the Council of Nicaea (325) in whose creed it was asserted that Christ was to be acknowledged as "of one substance with the Father". This safeguarded Christ's divinity but left his relation to humanity open. This latter question did not come to the fore until the 370s, near the end of the Arian controversy, when Apollinaris of Laodicea, a lifelong friend of Athanasius of Alexandria who shared many of his views, set out in radical terms how "one substance with the Father" should be understood. He asserted in a letter to the bishops of Syria that "the supreme point of our salvation is the incarnation of the Word", but that involved the Word becoming flesh without having assumed a human mind, which was subject to change and evil thoughts, "but existing as a divine mind immutable and heavenly". This view was sharply opposed by the Cappadocian Fathers who argued that "what he did not assume [i.e. manhood] he could not redeem". Apollinaris and his teaching were condemned at the Second Ecumenical Council in 381.

The question of the relation of the divine and human in the person of Christ was allowed to sleep for the next 45 years until in 428 Nestorius became archbishop of Constantinople while Cyril was archbishop (later patriarch) of Alexandria (412–44). The two major sees of eastern Christendom found themselves representing diametrically opposed understandings of the person of Christ. The resulting Council of Ephesus in June 431 (Third Ecumenical Council) condemned Nestorius. Cyril, however, in refuting his enemy, had used language that brought him near to the Apollinarian position. In his 12 Anathemas sent for Nestorius' assent in November 430 he spoke of "the one hypostasis [person] of the incarnate Word". This statement was not condemned by the council.

Cyril died in 444. His successor Dioscorus I (444–51, d. 454) was less cautious. He aimed not only at asserting Cyril's doctrine as the orthodoxy of Christendom as a whole, but also at vindicating the ecclesiastical superiority of Alexandria over Constantinople. Alexandria was in his eyes "the city of the orthodox". He found an ally in Constantinople in the monk Eutyches who asserted that the flesh of Christ was "God-made", and so Christ could in no sense be "consubstantial with us". Eutyches was condemned by a council presided over by Flavian, archbishop of Constantinople, on 22

November 448, but not before he had produced as proof of the veracity of his views a number of tracts written under the name of orthodox churchmen, including Athanasius and pope Julius I, which in fact were forgeries compiled by disciples of Apollinaris. Eutyches appealed to what he called the councils of other archiepiscopal sees, and this brought Rome into the debate. Early in 449, however, the emperor Theodosius II (408–50) convoked a new council to meet at Ephesus under Dioscorus' presidency. This resulted in the acquittal of Eutyches, the condemnation of Flavian and his fellow archbishop Domnus of Antioch, and the discomfiture of pope Leo's legates. A tract written by Leo in defence of Flavian, setting out the views of the papacy, known as the *Tome* of Leo, in which the two natures of Christ, human and divine, were affirmed, was conveniently not read. Dioscorus appeared to be triumphant.

Theodosius died on 28 July 450 from a fall from his horse, and there was an immediate reaction at the imperial court at Constantinople. A new council was summoned, to meet at Chalcedon (on the east side of the Bosporus) at the end of October 451.

This time the decisions went against Alexandria. Dioscorus was deposed, though for "indiscipline" rather than doctrinal heresy, and the sentence against Eutyches confirmed. A Definition of Faith was drawn up that declared that Jesus Christ "was made known to us in two natures unconfusedly, unchangeably, indivisibly, and inseparably", the "properties of each being in no way removed because of the union, but each nature being preserved and concurring into one Prosopon [outward personality] and one Hypostasis". Christ in two natures after the Incarnation had been affirmed and unity between Rome and Constantinople restored. However, the 28th canon of the council confirmed a decision taken by the Second Ecumenical Council, that Constantinople as New Rome was the chief bishopric in Christendom, though yielding a primacy of honour to Rome itself. This was Constantinople's title deed, and the reason why Chalcedon could never be renounced in its entirety. It was, however, unacceptable to Rome, not least because no reference was made to Peter and the Petrine primacy.

The next two centuries were to be occupied by increasingly desperate but unsuccessful efforts to find compromises between the one-nature and two-nature Christologies, and the questions of ecclesiastical primacy raised in the Second Council of Ephesus and Chalcedon. The subsequent disputes fall into four phases: (1) from Chalcedon to the *Henotikon* of Zeno (451–82); (2) the Acacian schism (482–519); (3) the Chalcedonian reaction (519–36); and (4) the final parting, post 536.

The decisions of Chalcedon were well received in Constantinople, Antioch, and Rome, but were greeted with explosions of popular anger in Jerusalem and Alexandria. Imperial troops restored order in Jerusalem allowing the double-faced patriarch Juvenal to return to his see. In Alexandria, however, the anti-Chalcedonians found leaders in Timothy Aelurus ("the Cat") and Peter Mongus ("the hoarse one"), both supporters of Eutyches. In March 457 Proterius, the Council of Chalcedon's choice as patriarch, was lynched and Timothy consecrated in his stead. The imperial government, with Leo I (457–74) as emperor, stepped in, and between 459 and 475 Timothy was in exile in the south Russian town of Kherson. At length, events forced the government to compromise. An 18-month usurpation by Basiliscus (January 475–August 476) aimed against Leo's successor Zeno (474–91), and the victory of the anti-Chalcedonian party in Antioch, where opponents of Chalcedon found a leader in Peter "the Fuller", led to the publication by Zeno of the Instrument of Unity (*Henotikon*) on 28 July 482. In this the emperor asserted that the safety of the Roman world depended on a universal acceptance of the creed of Nicaea confirmed at Constantinople (in 381). Both Eutyches and Nestorius were condemned, but Cyril's "one-nature" statements contained in his 12 Anathemas were upheld, and Christ "incarnate of the Virgin" was to be acknowledged as "one and not two". Anyone who taught anything different, "either at Chalcedon or any other synod whatever, we anathematize". The emperor (not a Church council) had spoken.

The *Henotikon* remained the official doctrine of the empire for 37 years. It was accepted by Alexandria, Antioch, Jerusalem, and Constantinople, but not by Rome. Pope Felix III (484–92) condemned it. The opponents of Chalcedon had no intention, however, of seceding from the Church administered and guided by the emperor and his patriarch, Acacius. The schism between Rome and Constantinople over the latter was not concerned principally with doctrinal difference, but with the question whether Acacius had deceived pope Simplicius (468–83) by denouncing Peter Mongus as "a son of darkness" and then accepting him as patriarch of Alexandria in succession to Timothy "the Cat".

The schism lasted from 483 to 519. In the meantime, the empire, governed by Zeno and Anastasius (491–518), moved steadily in the direction of one-nature Christology. Only the Latin-speaking provinces in the western Balkans remained wholeheartedly in favour of the Chalcedonian definition. The decisive moment came in 508 when Severus, a monk from a monastery at Maiuma, near Gaza in Palestine, was appealing against the pro-Chalcedonian attitude of Elias, patriarch of Jerusalem. Severus was a thrusting character as well as a fluent representative of one-nature Christology. He quickly gained the ear of the emperor Anastasius.

Meanwhile, the scene moved to Antioch, where in 510 Severus' ally, Philoxenus of Mabboug (Hieropolis) in Syria, quarrelled with his superior, the patriarch Flavian II of Antioch. To prevent an outright schism Anastasius promulgated a Formula of Satisfaction in 511. This document was ostensibly based on the *Henotikon* but denounced the *Tome* of Leo, and reduced the council of Chalcedon to the level of a disciplinary synod, while retaining the validity of the all-important canon 28. Next year Severus persuaded Anastasius to get rid of the patriarch Macedosius of Constantinople, while in 512 Philoxenus secured the same fate for Flavian II. In November 512 Severus became patriarch of Antioch and the anti-Chalcedonian movement became explicitly Monophysite.

Severus was originally from Sozopolis in Pisidia (Asia Minor), but he became leader of the movement whose two centres were Alexandria and Antioch. His theology was based uncompromisingly on what he believed had been that of Cyril of Alexandria. Everything that Cyril wrote, he stated (*Select Letters*, l. 9), should be regarded as canonical. He was

prepared to accept the *Henotikon* and disciplinary decisions against Dioscorus and Eutyches; his one-nature Christology had a place for Christ's consubstantiality with man: "In the last times He [the Divine Word]" took flesh of the Holy Spirit, and of the holy Theotokos and Ever-Virgin Mary, flesh consubstantial with us and animated by an intelligent and reasoning soul. "The same being was both God and man". Out of two natures there was now one. He was in consequence unsparing in his denunciation of pope Leo and his *Tome*, condeming it as self-contradictory and "Jewish", though he praised popes, supposedly forerunners of Monophysitism, such as Julius I, whose name the Apollinarians had appropriated.

The death of Anastasius on 9 July 518 brought about an immediate change. Justin I (518–27) was a Latin-speaker from Illyricum and he made his first aim that of restoring communion with the Roman see. The "two Romes" should work in harmony on the basis of mutual acceptance of the Council of Chalcedon and the removal of all traces of the Acacian schism. The latter was accomplished at the end of March 519, but Rome received no satisfaction regarding canon 28. Severus, however, found himself an exile in Alexandria, and 55 bishops, including Philoxenus, suspected of Monophysite leanings were similarly deposed between 519 and 522. Only in Egypt were the Monophysites left alone.

These arrests and depositions deprived numerous congregations, especially in Syria, of their pastors. The result was that by 530 pressure to ordain clergy not in communion with the see of Constantinople became overwhelming. John of Ephesus records how "every day 100 or sometimes 200 or 300 presented themselves for ordination ... It was like a river that had burst its banks." Confronted with the prospect of a permanent Monophysite schism, the new emperor Justinian (527–65) summoned orthodox and Monophysite leaders to a conference. Discussions lasted from February 532 to March 533. Agreement was nearly reached on the Theopaschite formula put forward by the emperor himself. This confessed that both the miracles and the sufferings of Christ were to be attributed to the same being, so that on the cross "one of the Trinity suffered for us". While Leo's *Tome* could be rejected, Chalcedon could not, and hence the division persisted.

Justinian left the door open for reconciliation with Severus, now embarrassed by a dispute with fellow exile Julian of Halicarnassus and his followers, who asserted that since Adam had been created incorruptible and immortal, and his fall had been the consequence of sin, Christ must also have been free from sin, and hence his flesh was incorruptible. Severus disagreed, arguing that Christ's body only assumed those qualities after the Resurrection. Esoteric though this dispute may have seemed, Julian won sufficient support in Egypt to threaten Severus' authority.

This, however, was bolstered by the emergence of the empress Theodora as a champion of the Monophysite cause. In 535 she influenced her husband to bring Severus to Constantinople. Here he persuaded the new patriarch, Anthimus of Trebizond, to accept the Monophysite thesis. The triumph was short-lived. Next year pope Agapetus visited the capital on a mission from king Theodahad, the Ostrogoth ruler of Italy. He persuaded Justinian to depose Anthimus on the grounds that his transfer from Trebizond to Constantinople was an offence against canon 15 of the Council of Nicaea which forbade bishops to move from one see to another. A letter signed by Justinian and Agapetus re-emphasized the orthodoxy of two-nature Christology. In June 536 a synod held at Constantinople excommunicated Anthimus and Severus as heretics, and persecution was renewed against other Monophysite leaders. Next year a Chalcedonian patriarchate was established in Alexandria. Severus' colleague Theodosius, elected patriarch despite Julianist opposition in 535, was ordered to Constantinople. The schism was now complete.

Justinian's aim of uniting the Church ultimately under a Theopaschite formula was frustrated by two events. First, with the aid of Theodora, a Monophysite mission to the Nubian kingdom of Nobatia succeeded from 542 onwards in converting that kingdom and later its southern neighbours Makouria and Alwah to Monophysite Christianity. Secondly, Jacob Baradaeus, bishop of Edessa, fleeing as a fugitive from the emperor's police, travelled the length and breadth of Syria and Asia Minor ordaining bishops and other clergy in opposition to the Chalcedonians (hence the name Jacobites for the Syrian Monophysites). By his death in 578 a new, hierarchically constituted Monophysite Church had come into being.

At the Fifth Ecumenical Council in 553 the emperor again tried to conciliate the Monophysites by having Theodore of Mopsuestia, Ibas of Edessa, and Theodoret of Cyrrhus condemned as inspirers and supporters of Nestorius. This merely led to a crisis among the western Churches without winning over the Monophysites.

Justinian's successor, Justin II (565–78), influenced by his wife Sophia, published two versions of a *Henotikon* (567 and 571) conciliatory to the Monophysites, though without explicitly condemning Chalcedon as they demanded. When repression again failed, the Monophysite Churches were in general left in peace through the reigns of Maurice Tiberius (578–82) and his successor, Maurice (582–602). In these years, largely due to the development of monasteries as landowners and their consequent influence over their tenants, Monophysitism consolidated its hold in Syria and Egypt. A tradition preserved in the *History of the Patriarchs* tells of an area near Alexandria where "there were 600 flourishing monasteries all inhabited by the orthodox", and that "their cultivators all held the true faith [Monophysitism]".

The Persian occupation of Syria and Egypt between 614 and 630 favoured the Monophysites, as being Christians opposed to the creed of the emperor. Herakleios's victory over the invaders in 630 produced one final effort to end the schism. The attempt in 633–34, however, to win first the Syrian and then the Egyptian Monophysites to a formula based on acknowledging a single source of activity, *energeia*, in the incarnate Christ, failed largely due to the highhandedness of Herakleios's viceroy in Egypt, Cyrus "the Caucasian". In protest, from now on, Monophysitism in Egypt was associated with the Copts as opposed to the "imperial" Melchite Church. When ultimately Herakleios published the *Ekthesis* in 638 asserting the single will in Christ (Monothelitism), the loss of Syria and Egypt to the Arabs rendered this as well as all previous efforts to repair the schism futile.

The dispute over acknowledging the incarnate Christ as "out of two natures, one", or "out of two natures, two", proved insoluble. Through the 6th century it marked a division between Constantinople and its richest provinces, gradually

fostering a spirit of independence in these. On the other hand, it contributed to the permanent rift between Constantinople and Rome, as the imperial capital strove to reconcile the views of the papacy and the majority of the eastern provincials. These reflected the ideas of the great monasteries which had come to own the land on which they worked. Though the debate was conducted throughout in terms of Hellenistic philosophy and theology, Monophysitism gradually provided a national identity for the Copts, Nubians, Armenians, and Ethiopians, preserving the national languages from absorption into a Greek lingua franca. From a dispute over wording, Monophysitism proved to be the major issue between Constantinople and the rest of Christendom from Chalcedon to the Arab invasions.

Summary

Monophysites believe a One-nature Christology, that the incarnate Christ is one person in which humanity and Godhead are united in a single nature. The movement began in the first half of the 5th century and found support in Alexandria. The Council of Chalcedon (451) condemned the Monophysites but the differences were not resolved. The movement has persisted and forms part of the cultural identity of Copts, Nubians, Armenians, and Ethiopians.

Montenegro

In its early history Montenegro (Crna Gora in Serbian) was part of Illyricum and the Roman province of Dalmatia. After Diocletian's administrative reforms of 297, it was included in the newly created province of Praevalitania. The nature of its mountainous terrain in the hinterland of the Adriatic coast (a section which in modern times stretches from the gulf of Kotor to Ulcinj and the Albanian border) played a noticeable role in its history. In the pre-Roman period there was a strong influence of Greek culture, especially along the coast. Trade was lively between the nearby Greek colonies at Lissos (Lješ) and Epidaurus (Cavtat) on the one hand, and the Illyrian maritime settlements, especially Buthua (Budva) and Rhizon (Risan), on the other. It is believed that the region east of Rhizon was the land of the Encheleans, to whom the Greek myth of Cadmus and Harmonia is linked. Their rocks were situated on the gulf of Kotor, which to ancient authors was know as the mouth of the Rhizon river. Traces of an ancient serpent cult point to the tradition of the Cadmus-Harmonia myth; it is corroborated by archaeological finds and survives in some folkloric customs.

According to a legend preserved in *De Administrando Imperio* by Constantine VII Porphyrogennetos (945–59), the foundation of Dioclea, originally a *kastron* (fort) at the confluence of the rivers Morača and Zeta, is ascribed to Diocletian himself. Although this is historically incorrect, Dioclea's early prominence is confirmed not only by archaeological remains dating from the pre-Christian period onward, but also by the fact that its name (Duklja) was eventually applied to the whole region. In the Middle Ages it was also known as Zeta. The earliest recorded mention of the name Crna Gora is in a charter issued by the Serbian king Stephan Uroš II Milutin (1282–1321), but it became current only in modern times.

With the gradual spread of Christianity, Skutari (Skadar) became the seat of an archbishop in the 4th century. First under the jurisdiction of the exarch of Thessalonica, it came under that of Justiniana Prima after 535.

The political and economic structure of Praevalitania's Romanized cities, based on trade as well as on the resources provided by livestock rearing, agriculture, exploitation of mines, and handicraft, crumbled under the attacks of Avars and Slavs in the 7th century, but its cultural achievements left an imprint on later periods.

Constantine Porphyrogennetos reports that, after a first attempt at Christianization during the reign of Herakleios (610–41), Serbs who settled in the regions of Travunia, Konavli, Zahumlie, and Dioklea were converted in the 9th century, during the reign of Basil I. Similar data are gathered from the *Chronicle of Bar* by the anonymous 12th-century author known as the Priest of Dioclea. There is evidence that the beginnings of Slavonic literacy in these parts, resulting from the missionary work of the disciples of St Cyril and St Methodios, also occurred in the 9th century. In the same period there emerged the beginnings of the cult of some eastern saints, among them St Tryphon, patron saint of Kotor, and St

Sergius and St Bacchus, whose shrine was on the Bojana river, near Skadar. In memory of the Syrian city where St Sergius was martyred, Skadar was sometimes referred to as Rosafa.

The rise to power of prince Stephan Vojislav of Dioclea (Zeta) represented a serious challenge to Byzantine rule. In 1042, near Antivari (Bar), Vojislav defeated the Byzantine army sent from Dyrrachium and created an independent state. Further blows to Byzantium were dealt by his son Michael, who in 1077 received a royal crown from Pope Gregory VII and became his vassal. Michael's son Constantine Bodin enlarged the realm by joining to it Raška and Bosnia. Soon, however, the centre of power in Serbian lands moved to Raška. During the reign of the grand župan (satrap) Stephan Nemanja (1169–96) Zeta and Raška were united and remained one state until the death of tsar Stephan Uroš IV Dushan, in 1355. Like Nemanja himself, who established his court in Kotor, all rulers of his dynasty accorded Zeta a privileged position in the realm. Zeta provided a vital link for commerce with Italy, Dubrovnik, and other Adriatic cities. One of the inland routes, leading from the coast, north of Lake Skadar, through Peć, the field of Kosovo to Niš, and further to Bulgaria, was named Via de Zenta.

In the cultural sphere, an attractive symbiosis of western and Byzantine influences prevailed in the ever-increasing building activity in the region. As old ecclesiastical centres in Zeta's coastal towns were left outside the jurisdiction of the Byzantine archdiocese of Ohrid (created around 1019), their gravitation towards Rome was reinforced after the Great Schism of 1054. The situation remained unchanged during the Nemanjić period and members of the ruling family often made donations to Catholic establishments. However, Orthodoxy spread in the surrounding countryside and in the hinterland, especially after the creation of the autocephalous Serbian Church in 1219, with Nemanja's youngest son Sava at its head. As scores of Orthodox churches and monasteries were built in the newly founded bishoprics of Zeta, connections with the Greek-speaking world increased, thanks to the strong spiritual and material links with Thessalonica and Mount Athos. Wall paintings dating from 1252 preserved at Morača, in a church built by Nemanja's grandson Stephan, and smaller fragments in St Peter at Bogdašić, near Tivat, built by Neophyt, the Serbian bishop of Zeta, in 1268–69, rank among the highest achievements in the art of the Byzantine world.

When circumstances allowed it, church-building revived in the Ottoman period: a remarkable monument is the monastery of Piva, with wall paintings dating from 1605. Of great historical importance are clusters of churches, now mostly in ruins, in the Lake Skadar area: Starčeva Gorica, Beška, Prečista Krajinska, Moračnik, and others.

With the disintegration of central authority in the second half of the 14th century, Montenegro's feudal lords, former heads of clans, were involved in the turbulent events caused by the coming of the Turks. The families Balšić and Crnojević gained prominence in this early phase of a protracted period of conflict over the Adriatic, in which the Ottoman empire, Venice, and other European powers were chief protagonists. For a long time, deprived of its coast and under constant Turkish attacks, a tiny Montenegro, reduced to its most inaccessible parts with the centre at Cetinje, maintained a variable degree of autonomy. The land was governed by a council of clan leaders, headed by successive bishops, among whom was the celebrated poet Petar II Petrović-Njegoš (1830–51). In Njegoš's works, with the tragic position of his people as his main concern, elements of poetry inspired by Classical authors and those of Romanticism are brilliantly woven into his own Orthodox spirituality.

As the Ottoman empire weakened, the virtual independence of Montenegro spread over a wider territory. This was not always readily sanctioned by the Great Powers, but the Montenegrins' frequent rebellions against the Turks, their courage and perseverance, earned them renown and sympathy abroad.

A kingdom under Nicholas I from 1910, Montenegro was victorious in the Balkan Wars (1912–13) with its Greek, Serbian, Bulgarian, and Romanian allies, when much of its territory was regained, except for lands given to the newly created state of Albania. In 1918 Montenegro joined Serbia in "The Kingdom of Serbs, Croats, and Slovenes", soon to be called Yugoslavia.

Mosaic

Mosaic is a surface decoration consisting of different particles, such as stone or glass, set in a foundation, usually a mortar bed. It is primarily a form of monumental decoration, but it may also be used on a small scale.

The earliest mosaics, dating from the 4th millennium BC, were found in Mesopotamia. Mosaics existed in ancient Egypt and Minoan Crete, ancient Greece, the Roman Empire, and its Christian successor states, as well as in the medieval Islamic world. There are extensive survivals of early Christian and medieval mosaics in Italy, but the importance of mosaic as an art form there diminished in the Renaissance; north of the Alps mosaic was used only sporadically during the Middle Ages. In Byzantium the medium was exploited on a vast scale, even though its use as the most expensive form of Orthodox Church decoration declined in the second half of the 14th century. Mosaic was revived as a monumental decoration in western Europe in the 19th century, and continued to be employed in the 20th.

Even though pebbles and other natural materials are used for mosaics, in its more developed form it is made from square or rectangular particles specially shaped for the purpose, known as *tesserae* (Latin: "dice"). The more regular shape of the tesserae makes for greater precision in laying the mosaics and allows for special visual effects. The size of the tesserae is often varied, small cubes being used for faces and hands and larger ones for drapery and backgrounds. Apart from different types of stone, tesserae are made of glass and terracotta, but mother-of-pearl, shells, and semi-precious stones have also been found among mosaics. At times, mosaics are touched up with paint.

Glass tesserae are found in Roman mosaics from the 1st century AD. They were employed primarily in wall mosaics, because their brittleness did not make them suitable for floor covers. The effects of glass mosaic on walls were exploited fully only in the medieval period. Ancient and medieval glass was made from sand, potash, and lime and coloured with metal oxides; tesserae were produced by breaking sheets of glass into small particles. Gold tesserae were made by placing gold leaf on a sheet of glass and then enclosing it within another layer of glass. In early gold tesserae the lower layer of glass was colourless, but from the 8th century onwards red glass came to be used, adding lustre to the metal. Silver tesserae are made by using either silver or tin leaf. Gold and silver tesserae were rarely used before the 4th century AD.

Wall mosaics were executed in situ on a scaffolding. The tesserae were placed in the last of several layers of mortar or plaster that coated the wall (on curved surfaces nails or clamps served to hold the plaster in position). The final layer of plaster was applied in patches corresponding in size to the amount of tesserae that could be laid by the mosaicists before the plaster dried up. Rough outline drawings or, at times, highly finished paintings (e.g. at the Kariye Camii in Istanbul) were applied directly to the plaster to guide the craftsmen. Very little is known about the working methods of mosaicists. The 12th-century mosaics in the church of the Nativity at Bethlehem are signed by a certain Ephraim who identifies himself as a painter and mosaicist, but usually there was probably a distinction between artists designing the imagery and those executing the mosaics, not to mention artisans specializing in preparing the plaster bed. Mosaicists are likely to have worked in teams. Larger areas requiring a single colour may have been worked on by apprentices, leaving the faces and other details to more highly skilled craftsmen. In order to facilitate the laying of mosaics, the tesserae were probably sorted into trays according to colour and size. A technical examination of the 11th-century mosaics in St Sophia at Kiev, which appear to have been executed by Byzantine craftsmen, has given some idea of the speed at which mosaics were laid: the 640 square metres of mosaic were executed in 320 days.

Even though there are some examples of mosaics on the outside of churches, especially in the Italian peninsula, wall mosaics are essentially a medium for the interior of buildings. In dimly lit interiors and on curved surfaces they are a visually more effective medium than fresco. In Byzantine art, in particular, the properties of mosaic are exploited to full effect. Mosaicists used the curved surfaces of domes, squinches, and apses to catch the natural light in order to make the mosaics sparkle and glitter. The refraction of natural light on the tesserae is enhanced by the irregular surfaces; cubes tilted at different angles and irregularly spaced are essential to creating glitter. Mosaic is, however, an inflexible medium because it consists of blocks of pure colour. But because mosaics were designed to be seen from a distance, mosaicists were able to overcome this limitation and created, in the eyes of viewers, the optical illusion of colour gradation.

The earliest surviving mosaics from ancient Greece are the pebble mosaics from Gordium in Asia Minor (8th century BC). Pebbles were used to represent mythological scenes at Olynthus (*c.*400 BC) and Pella (4th century BC), both in northern Greece. Gradually, mosaic makers realized the advantages of using tesserae. At the temple of Zeus at Olympia pebbles are used in conjunction with cut stones. Mosaics made of tesserae from the 2nd century BC exist on the island of Delos. Pergamum was an important centre of mosaic production. Sosos, who, according to Pliny the Younger was the most famous mosaicist of the ancient world, is said to have been active there. He is credited with having invented the motif of the *asarotos oikos* ("unswept floor") and of doves perched on a vase, both motifs being widely used in Hellenistic mosaics. Greek mosaicists were active at Pompeii, as is suggested by the name Dioscurides of Samos, which is found in two Pompeian mosaics. The surviving mosaics at Herculaneum include not only floor but also wall mosaics, as well as mosaics embellishing garden furnishings, such as fountains and niches. There are extensive survivals of late Roman mosaic floors at Antioch (3rd century AD). The bucolic scenes in the floor mosaic of the imperial palace at Constantinople are a very late example of this tradition, dating from the 7th century AD. Floor mosaics also occur in some Christian churches (Aquileia, 4th century; Palestine, 6th and 7th centuries; 12th-century France and Italy), but the rarity of such floors indicates that Christian subject matter was generally considered unsuitable for floors.

The earliest surviving Christian wall mosaics are found in Rome (crypt of Old St Peter's, *c.*330, Santa Costanza, *c.*350, and Santa Maria Maggiore, 432–40) and in Ravenna (Mausoleum of Galla Placidia, *c.*430–50, and the Orthodox Baptistery, *c.*460). The earliest extant mosaic decoration in the Greek-speaking part of the Roman empire is in the church of

Mosaic: Apollo (right) and Daphne in a mosaic panel from the House of Dionysus, Nea Paphos, Cyprus, 3rd century AD

Hagios Georgios in Thessalonica, formerly the mausoleum of Galerius (died 311); they date from the 5th century, marking perhaps the conversion of the mausoleum into a church. The surviving sections of this mosaic show a series of over-life-size male saints against an elaborate architectural backdrop on a gold background. Other early Christian mosaics in Thessalonica are the fragments in the 5th-century church of the Theotokos Acheiropoietos and the apse decoration in the church of the Latomos monastery (now called Osios David), dating from the 5th or 6th century. This mosaic, which shows Christ enthroned on a rainbow in the presence of St John and an Old Testament prophet, is the earliest extant apse mosaic in the Greek world. The last of the major schemes of mosaic decoration in Thessalonica prior to the iconoclast controversy are the now largely destroyed mosaics in the church of St Demetrios, dating from the early 7th century, which present a visual hagiography of the saint.

When Ravenna was incorporated into the Byzantine empire by Justinian's army, the city had a rich tradition of mosaic decoration (San Apollinare Nuovo, *c.*500, and the Arian Baptistery, *c.*500–25, in addition to the buildings mentioned above). Justinian, the empress Theodora, and their court are shown on two large panels among the 6th-century mosaics in San Vitale. The imperial couple do not appear to have been involved in the embellishment of the church. Two 6th-century schemes of mosaic decoration are far more closely associated with Justinian, occurring in buildings commissioned by the emperor. These are the earliest mosaics at Hagia Sophia in Constantinople, depicting crosses as well as geometric and floral motifs on a gold background (532–37), and the apse decoration in the main church of St Catherine's monastery at Mount Sinai, showing the Transfiguration (*c.*565/67).

The aniconic nature of the early mosaics at Hagia Sophia undoubtedly contributed to their survival during the period of iconoclasm. A mosaic in a small room in the patriarchal palace next to the church demonstrates the fate of many religious figurative mosaics during the iconoclast period. These mosaics show two crosses, the main form of religious decoration during iconoclasm. Golden tessarae underneath the cross show signs of disturbance. There are remnants of inscriptions, indicating that the crosses replace pre-iconoclast depictions of saints. Most iconoclast mosaic decoration was replaced with figurative decoration after the end of iconoclasm. This process could be seen in the apse mosaic of the church of the Dormition at Nicaea (Iznik), now destroyed. The ghostly outlines of a cross appear behind a depiction on the mosaic of the Virgin and Child. The apse mosaic at Iznik consisted of three different phases: a pre-iconoclast Virgin and Child, an iconoclast cross, and a post-iconoclast figurative image. Documentary evidence suggests that the art of mosaic making flourished during the iconoclast period in secular contexts, decorating imperial palaces. Mosaic decorations in the Dome of the Rock in Jerusalem (680s) and the great mosques in Damascus (*c.*715) and Córdoba (961–68), which appear to have been executed by Byzantine craftsmen, testify to the vitality of Byzantine mosaic decoration during and immediately after iconoclasm.

Most of the mosaic decoration at Hagia Sophia dates from the post-iconoclast period. The apse mosaic of the Virgin and Child enthroned was dedicated in 867 and the series of patriarchs in the tympanum dates from the late 9th century. The Great Church contains a number of mosaics showing emperors and empresses. These include an emperor in *proskynesis* (veneration) before Christ above the royal doors opening into the nave of the church (late 9th to early 10th century), the

Virgin and Child with Constantine and Justinian (early 10th century), and the panels showing Constantine IX Monomachos (1042–55) and Zoe and John II Komnenos (1118–43) and Irene making pious donations to, respectively, Christ and the Virgin.

The emergence of a centralized church plan in the post-iconoclast period was accompanied by the development of an extensive programme of pictorial decoration. Mosaic is used at the church of Hosios Loukas (early 11th century) in central Greece, Nea Moni on the island of Chios (mid-11th century), and Daphni (*c.*1100) west of Athens, to depict a hierarchical scheme of decoration, with the image of the Christ Pantokrator in the dome surmounting New Testament scenes and images of saints and, often, the Theotokos and Christ in the apse.

There are no survivals of Byzantine mosaics from the 12th century, but there is evidence for mosaics in that period. The Pantokrator monastery in Constantinople, founded by John II Komnenos (1118–43), was decorated with mosaics. The mosaics of Norman Sicily (Cefalù, and the Cappella Palatina and the Martorana in Palermo), which were executed at least partially by Byzantine craftsmen, give a good idea of Byzantine mosaic decoration in the 1140s.

There are considerable survivals of Byzantine mosaics from the last two centuries of the Byzantine empire. These include the decoration of the Theotokos Paregoritissa at Arta (1294–96), the Fetiye Camii (*c.*1300) and Kariye Camii (*c.*1320) in Constantinople, and the church of the Holy Apostles in Thessalonica (1310–14).

A special feature of Byzantine art is mosaic icons, of which some 48 survive, dating in the main from after 1261. In these icons the tesserae are set in a hollowed wooden tablet and fixed in a bed of resin or wax. Although the size of mosaic varies, many are very small. Consequently, the tesserae, which consist of gold, gilded copper, silver, ivory, and semi-precious stones, are minute, often not exceeding one square millimetre. These precious icons were probably used in private devotion.

Museum of Alexandria

The *Mouseion* (Museum) in Alexandria was the most famous of all in antiquity. The members of a *mouseion* were originally connected with the cult of the Muses, who were worshipped at an altar, often in open-air porticoes or courts rather than in a temple, and were dedicated to the arts inspired by them. They were significant centres of literature and education, and often the focus of a society dedicated to the creation of literary compositions.

The Museum was located at Alexandria in Egypt, a city founded by Alexander the Great in 331 BC. Although we cannot as yet identify its exact location within the ancient city, we do know that it was near, or in the grounds of, the royal palace, or *Basileia*, which lay close to the harbour on the northern side of the city. It was founded in 280 BC by Ptolemy I Soter, one of Alexander's generals and a historian himself, on the advice of Demetrius of Phalerum. The latter had been one of Aristotle's pupils at the Lyceum in Athens, but was expelled from the city for his pro-Macedonian sentiments. Demetrius was influenced by the so-called Peripatetic school's approach to the acquisition of knowledge, and upon his arrival in Alexandria he persuaded Ptolemy I to establish an institution dedicated to the pursuit of knowledge along the lines of the Athenian model. The Museum was greatly expanded by Ptolemy II Philadelphus (308–246 BC).

Since we do not have any extant remains, we must rely on Strabo's description of it (*Geography*, 17. 1. 6–10) during the period when he was resident in the city – the late 1st century BC. He states that the Museum was part of the royal palace, and served as a gathering place for scholars, artists, and literary figures who held property in common. The facilities consisted of an *exedra*, or crescent-shaped arcade with seats for lectures, a *peripatos*, or covered walkway planted with trees where discussions often took place, and a large house with a communal dining area.

We know that the Museum was separate from, but closely associated with, the Library, also established by Ptolemy I. It may have had its own collection of books housed in nearby storerooms, but this is only conjectural. The names of those associated with the institution are not known, except for its last member, Theon (*c.* AD 380), but a number of prominent scholars and scientists lived in Alexandria, some of whom were affiliated with the Library, and no doubt participated in some of the activities at the Museum. These scholars were drawn from a variety of disciplines – both literary and scientific – and are represented by individuals such as Euclid, Eratosthenes, Callimachus, Apollonius Rhodius, Herophilus, Aristarchus of Samothrace, Aristarchus of Samos, Aristonicus, and Apelles. They flourished in an environment of sophisticated literature at the court and the metropolitan atmosphere of the city.

Ptolemy I Soter followed in the tradition of enlightened cultural support practised by kings and tyrants from the 6th century BC (the Pisistratids in Athens and Hieron in Sicily) down to the Macedonian kings in the 4th century BC. There was also a tradition in Egypt, as in the Greek world, of the association of religion with learning, and temples served as centres of literacy and repositories for knowledge. A third factor was the competition between the successors of Alexander the Great for cultural supremacy in an empire divided into factions after his death. The forerunners of the Museum at Alexandria were Plato's Academy in Athens, where the emphasis was on science and philosophy, and Aristotle's Lyceum, also in Athens, which was concerned with the systematic collection, organization, and preservation of knowledge.

The Museum flourished under the rule of the Ptolemies (304–31 BC) and received continued support under the Roman emperors. Its members served as a group of resident scholars invited to Alexandria by the king, who then maintained them at his expense. They were provided with living quarters and food and given salaries; they were also exempt from taxation. The king appointed a president who served as an administrator, or *epistates*, and the priest in charge of the cult of the Muses (*hiereus*). The primary focus was on research, although there may have been lectures, but its members were not required to teach. Dinners and symposia were held, characterized by a search for solutions to a stated problem; the resolutions were later recorded on papyri. Scholars were drawn from all parts of the Greek world to participate in state-subsidized learning – the acquisition of knowledge for knowledge's sake, rather than as the means to a specific end.

Research at the Museum focused on science and literature, unlike its Athenian predecessors, which often emphasized philosophy. In the field of science, the emphasis was on experimentation and the collection of empirical data to support observations and theories, resulting in the development of a scientific methodology for the solution of problems. Textual criticism, and the collection and cataloguing of literary works in order to ensure the preservation of knowledge of Greek and other Near Eastern civilizations – an antiquarian approach to history – were the hallmarks of the institution's literary endeavours. In the course of textual criticism, critical judgements were made regarding the relative importance of different versions of a single text. Revision involved the weeding out of versions considered to be inferior. It is clear from the papyri that one of the great contributions of the Museum was the stability of the texts of ancient authors, especially Homer.

The environment created in the Museum was one of a "worldwide" intellectual tradition resulting from a fusion of oriental and Mediterranean knowledge with an international centre of culture at Alexandria, where the study of science and literature flourished. This in turn contributed to the formation of a fairly uniform metropolitan urban civilization in the Hellenistic period, of which Alexandria was one of the first examples. The Museum was instrumental in the development of the concept of an institution dedicated solely to the acquisition of knowledge, a forerunner to the universities and research institutes of the present day.

This changed somewhat in the 2nd century BC, when the native segment of the population at Alexandria reacted against the influence of Hellenism. It was reinforced by an economic crisis characterized by rising prices and social unrest, in addition to hostility among members of the royal family. Ptolemy VI Philometor expelled foreign scholars and immigrants (*c.*146 BC), and their places in the Museum were occupied by native Alexandrians. Now other centres of culture and learning competed with Alexandria for scholars and students – at Pergamum, Athens, Antioch, and Rome. At this point the city lost its position as the primary cultural centre of the Greek world.

The fate of the Museum is still disputed. It seems to have escaped destruction in 48 BC when Julius Caesar burned the ships in the nearby harbour, setting part of the royal quarter on fire. It enjoyed renewed prosperity under the *Pax Augusta*, and the Roman emperors visited and extended the buildings, especially the philhellene Hadrian. In the Roman period the acquisition of knowledge became more secularized, but Alexandria continued to be an important centre of Greek learning. Many renowned residents and visitors were still associated with its research institutions, such as Plutarch, Ptolemy of Alexandria, Lucian, and Plotinus.

Research in science and medicine flourished, as did the study of philosophy which was closely intertwined with religion, but there was a marked decline in literary endeavours. In the 2nd century AD it was famous for the New Rhetoric, and in the 3rd century for Neoplatonism. The Museum suffered under Caracalla, who expelled its foreign members and abolished sustenance payments for others in AD 216. It appears to have been destroyed by Aurelian after the city made an abortive attempt at independence after his defeat of Zenobia, queen of Palmyra, in AD 272, but it soon resumed its activities. In the 4th century Ammianus Marcellinus (22. 16) reports scientific activity, but admits that there was a decline in scholarship. In all probability the Museum did not survive long after Theodosius I's edict in 391 requiring the destruction of all pagan temples.

The collected and evaluated information and wisdom of antiquity, as well as new strides made in the acquisition of knowledge in a variety of scientific and literary fields by members of the Museum in Alexandria, have been transmitted to the present day through Islamic rulers, who were themselves very interested in Graeco-Roman civilization. In the Arab world of the 7th–11th centuries there was a period of cultural awakening characterized by an interest in learning, and translation of ancient texts by Arab scholars. Great libraries and research centres based on the Alexandrian model, such as the one at Baghdad, were established in the Islamic world. The knowledge acquired by scholars in Hellenistic Alexandria was essential to the scientific experiments of Arab scholars, also conducted according to scientific methods of research developed in that city's institutions.

The Museum at Alexandria, then, was the inheritor of the Classical Athenian tradition of the acquisition of knowledge in an environment dedicated solely to that purpose. It in turn passed that tradition on in a new form, developed as a result of its position as the centre of Greek culture in the 4th and 3rd centuries BC, and the institution continued to diffuse the heritage of Greek culture to the rest of the world in the Hellenistic and Roman periods. Its members contributed a new body of scientific information and methods, and procedures for textual revision and literary criticism in addition to their efforts at collection, collation, and preservation in an attempt to save the knowledge of the past. The Museum passed on a tradition of pure research in the context of an institutional setting to other Graeco-Roman centres as well as the Arab world. Medieval and Islamic scholars, and later Christian scholars and humanists of the European Renaissance interested in Greek and Roman civilization, built on the foundations developed at the Museum in Alexandria. They too established their own research centres dedicated to higher learning – the forerunners of modern-day universities and research institutes.

Summary

The Museum (*Mouseion*) of Alexandria was founded in 280 BC by Ptolemy I Soter. Modelled on Plato's Academy and Aristotle's Lyceum, it was a cultural centre for scholars, artists, and writers which provided facilities for teaching, discussing, and dining. It was separate from, but closely linked with, the Library. It survived until the 4th century AD.

Museums

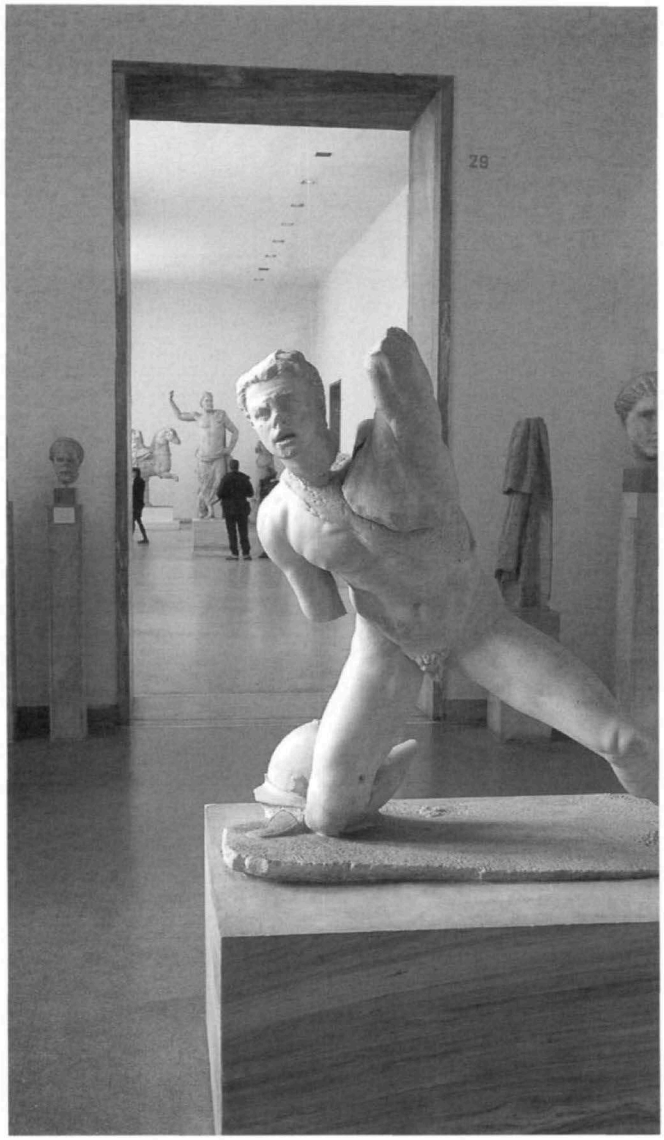
Because of the Turkish occupation, museums in Greece were slow to become established. During the 18th century some foreigners in Athens with antiquarian interests had assembled collections in their homes, which they showed to interested travellers. Prominent among them were the two rivals, Luisieri, the Italian painter who was Lord Elgin's agent in Greece, and the Frenchman Louis-François-Sebastien Fauvel, Choisseul-Gouffier's representative in Greece and consul of France in Athens from 1803.

By the early 19th century the idea of a Greek museum had become linked with the notion of the revival of the Greek nation. In 1807 the leading Greek intellectual Adamantios Korais, angered by the pillage of Greek relics, put forward a proposal for the foundation of a Greek museum in a safe building that would house manuscripts, coins, and other antiquities, donated and bought, and all to be inventoried, with details of their provenance. Korais's suggestions were not implemented and it was only in 1829, after independence, that a Greek National Museum came into existence. The island of Aegina, where some of the earliest and most impressive finds had been made, was chosen by Kapodistria's government to host the museum, in a disused orphanage. But it soon became evident that space was at a premium, and after the assassination of Kapodistria in 1831 and the establishment of the first Archaeological Service in 1833, attention was focused on Athens, and provisions for a museum there were made in the First Archaeological Law of 1834. In preparation, the dispersed antiquities of Athens were collected in various designated buildings, and after the closure of the Aegina museum in 1834, the antiquities from there were gradually transported to Athens and also housed in those buildings. In 1837 the *Archaiologiki Hetaireia* (Archaeological Society) was founded and undertook the systematic collection of antiquities, through purchase and donations. In 1858 a large room in the newly built Athens University was set aside for the university's own substantial collection. This was the first museum open to the public. It was later transferred to the Varvakeion school, and from there to the Polytechnic in 1881. From 1877 it housed Schliemann's finds from Mycenae and had to charge admission to provide for its upkeep.

Only in 1866 were the foundations laid for a National Archaeological Museum in Athens, and construction was not completed until 1889. In 1858 Demetrios Bernardakis, a Greek from Petroupolis in Russia, had contributed 200,000 drachmas towards the building, but disagreement over the site and architectural plans caused much delay. The problem of location was resolved through the donation by Eleni Tositsa in 1866 of land on Patision Street, next to a plot that she had previously donated for the construction of the Polytechnic. The plans adopted were those that the German painter and architect Ludwig Lange had proposed a few years earlier, with various alterations, supervised in the last stages of construction by the architect E. Ziller. The museum housed the most significant antiquities from the whole of Greece, as well as the numismatic collection (today in the Iliou Melathron, Schliemann's former home) and the epigraphic collection, both of which had previously been in the Aegina Museum; in 1983 the *Archaiologiki Hetaireia* handed over its own sizeable collection. During the middle decades of the 19th century the Acropolis Museum, close to the Parthenon, was also built.

Other Athenian museums were not established until the 20th century. These include the Keramaikos Museum (1936), the Byzantine Museum (1926), and the Museum of Popular Art (1918, in new premises since 1973). Today Athens is home to 30 museums and galleries. Some of these are private and semi-private museums open to the public (important private collections having existed in Athens since the early 19th century), notably the prestigious Benaki Museum, housed in the family home of the donor, Emanuel Benaki, since 1931, the Kanellopoulos Museum (1972), and the Goulandris Museum of Cycladic art (1982).

The archaeological law of 1834 which provided for the establishment of museums in Athens also provided for the foundation of provincial museums, to house local finds not destined for the capital. The first purpose-built provincial museums date from the second half of the 19th century (at Sparta, Olympia, and Epidaurus), but most were built in the 20th century. Even today many small museums continue to be housed, more or less successfully, in a variety of buildings, including private houses, churches, and mosques. Thessalonica, the second largest city in Greece, did not acquire a modern archaeological museum until 1962. Since then great developments have taken place, including a new Museum of Byzantine Culture inaugurated in 1994. As European City of



Museums: National Archaeological Museum, Athens, built in 1866–69

Culture in 1997, the city boasted nearly the same number of museums as Athens, some of which were refurbished or relocated for the occasion.

In the last decades of the 20th century the Ministry of Culture (which is responsible for museums) has had to deal with three main problems with regard to museums: the often critical lack of space for storing and displaying the ever-increasing number of excavated antiquities; the enormous overheads generated by the running of a large number of museums; and the safety of collections that are increasingly at risk, particularly in provincial museums (the theft of 276 antiquities from the Corinth Museum in 1986 highlighted these risks). A growing awareness of issues of conservation and environmental monitoring has left its mark on the larger museums, with more trained conservators now being employed, but the progress has yet to trickle down to the provincial museums, many of which are entirely deprived of funding for such services. Since the 1970s plans have been afoot for a new, larger Acropolis museum, with suitable space and environmental conditions to display the Parthenon Marbles, if and when they are returned, but progress has been predictably slow.

Like all museums in the West, Greek museums today face the challenge of their greatly enhanced scope and function: the provision of designer displays, frequent temporary exhibitions, and high standards of cataloguing. The need to modernize is a concern for all Greek museums, but the results depend on the availability of resources, organizational skills, and expertise, and these vary greatly from museum to museum.

Music

Music has featured prominently in Hellenic society since the dawn of Greek civilization. The dominant form of musical expression for all periods has been song, the sacred and secular genres of which have included cultivated, rural ("demotic"), and popular repertories. Despite the existence of Hellenic systems of musical notation since at least the 3rd century BC, the historical reliance of Greek performers on oral methods of transmission has resulted in the loss to posterity of most pre-modern melodies. All of the complete works and substantive fragments preserved from antiquity in vocal and instrumental notations based on the Greek alphabet, for example, fit comfortably on a single compact disc. This loss is offset to some degree by the survival of many ancient song texts, from which certain rhythmic details may be recovered, as well as by rich philosophical and theoretical traditions of writing about music. No secular melodies have been preserved from the Byzantine empire, but its liturgical chant is transmitted in neumatic notation by an impressive body of manuscripts dating from the 10th to the 20th century AD. However, the realization of these neumed sources presupposes knowledge of orally transmitted conventions of performance practice, the amount of which increases with the antiquity of the manuscripts.

These daunting gaps in the historical record have made it difficult for scholars either to trace the development of Hellenic music as a continuous tradition or to draw more than superficial conclusions about its diachronic character. Interpretation of the available evidence, particularly with regard to the musical effects of interaction with neighbouring peoples, has been further complicated by the cultural politics of the 19th and 20th centuries. While some Greek scholars have made exaggerated claims for continuity, Western musicologists have until recently tended to see mainly discontinuity between the musics of ancient Greece, Byzantium, and modern Greece. Reflecting such broader cultural phenomena as the struggle to define a modern Greek identity in the face of

Music: dancers and an *aulos* player among the figures depicted on a vase found in Boeotia, 5th century BC, National Archaeological Museum, Athens

Western expectations, these views have led to a priori rejections by various groups of a wide array of living and historical repertories as unacceptably tainted by foreign influence, usually identified as either "Arabo-Turkish" or "Western". These criticisms notwithstanding, only in the later decades of the 20th century has the study of problems for which enough sources survive to make comparative study meaningful – for example the relationship of post-Byzantine and Ottoman music – progressed sufficiently to yield reliable preliminary results.

The following brief historical survey will be limited to music created and performed by speakers of the Greek language. Further developments of Hellenic musical traditions by others – notably the medieval Latin, Arabic, and Turkish extensions of ancient Greek and Byzantine music theory, and the impact of Renaissance humanist study of Classical Greek music and drama on the development of opera – will therefore not be considered. For technical expositions of Greek and Byzantine music theory, readers are referred to the specialized studies in the appended bibliography.

Portrayals of musicians and musical instruments in Cycladic, Minoan, Mycenaean, and Cypriot art of the 2nd and 3rd millennia BC show that these societies employed music in public ritual and domestic entertainment. Echoes of these early traditions may be discerned in the narratives and poetic structures of the Homeric epics, works which mark the transition from an era of purely oral transmission to one in which the texts of certain cultivated genres of song were regularly committed to writing by their poet-composers. Witnesses to the subsequent development of Hellenic music include the texts of Greek lyric poetry, literary references to music, and depictions of musicians in pottery and other art. A formative era reportedly marked by Phrygian and Lydian influence was followed in the 7th and 6th centuries BC by the emergence of regional schools of composition and the diffusion of their characteristic forms. Lesbos produced intimate monody in the form of Sappho's Aeolian lyric, while more public forms of art were encouraged by the city states of the Greek mainland through their sponsorship of music competitions held in conjunction with such civic and religious festivals as the Spartan Carneia and the Pythian Games of Delphi. At these events professional soloists demonstrated their skill on the *kithara* (lyre) and the *aulos* by performing set pieces (*nomoi*), while choirs of amateur singers and dancers were incorporated into presentations of choral lyrics, out of which eventually developed both the Dionysian dithyramb and tragedy.

As the traditional repertories of cultivated song reached their apogee in the 5th century BC with the works of Pindar and the Attic tragedians, the study and performance of *mousike* – music conceived as an indissoluble complex of poetry and melody – achieved an unprecedented (and since unequalled) level of significance in Greek society. The ideal Hellenic gentleman thus became a cultivated amateur musician trained by an educational curriculum in which poetry sung to lyre accompaniment held a place of honour. By the turn of the 4th century BC, however, the cultural consensus surrounding music began to dissolve in the face of internal and external pressures. Melodic and metrical innovations by such composers as Euripides and the virtuoso Timotheus (*c.*450–*c.*360 BC) transgressed the stylistic boundaries between traditional genres, provoking harsh criticism from Aristophanes and other musical conservatives. Symptomatic of these changes was the progressive replacement of an older modal system of melodically and rhythmically distinct modes (the Dorian, Phrygian,

etc. *harmonia*) with a complex system of interlocking scales (also called *harmoniai*) designed to facilitate modulations. The bonds between music and poetry in Greek culture were thus left greatly weakened for the remainder of antiquity, as were the ties between amateur and professional music making. Although musical performances remained ubiquitous in the Hellenistic and Roman periods, vocal and instrumental music outside cult and state ceremony was largely reduced to entertainment. Professional musicians, whether male virtuoso kitharists or female *aulos* players offering sexual services to symposiasts, were accordingly relegated to a low place in the social order.

Perhaps the most enduring musical legacies of the Classical period are to be found in the critical, scientific, and speculative traditions of writing about music that emerged from it. The figure of Pythagoras (*fl. c.*530–497 BC) stands at the head of two complementary streams of Greek musical thought: the one emphasizing philosophical, social, and metaphysical concerns, and the other a theoretical tradition originally concerned not so much with the craft of composition (the subject of most Western "music theory" since the Renaissance) as with the physics of sound and the systematization of tonal systems. Fundamental to both approaches was a belief in the kinship of mathematics and music, a concept extrapolated from observing that a resonating string divided in length according to the ratios 2:1, 3:2, and 4:3 produced the intervals of, respectively, an octave, a fifth, and a fourth. The influence of Damon and other early authors whose writings are now lost may be discerned in the works of Plato, a musical conservative who eschewed the use of technical terminology while exalting an idealized version of the previous century's cultivated amateurism. In the *Laws* and the *Republic*, Plato assigned *mousike* a prominent but carefully regulated role in education by emphasizing the governance of texts over melodies, which should be set only in the Dorian and Phrygian *harmoniai*. He wished to ban the remaining modes from his perfect state because of their inherently unsuitable ethical qualities, thus reflecting his belief that each of the Greek modes possessed a distinct ethos which could be imparted through habituation. The means for achieving these effects are intimated in the *Timaeus*, in which Plato echoes Pythagorean doctrine by suggesting that both the human soul and the universe as a whole are constructed according to the mathematical proportions of the harmonic series. Aristotle, while sharing Plato's distaste for contemporary virtuosity, rejected such metaphysical speculations in favour of a more empirical approach. Believing that ethos could be mediated by abstract instrumental as well as by texted vocal works, Aristotle saw the ethical force of music arising from the embodiment of emotional states in sound and rhythm, a theory subsequently disseminated by his students and further developed by the Stoics. Although advocating in his *Politics* a total proscription of the *aulos*, Aristotle more closely reflected the societal standards of his time by admitting all the modes and accepting entertainment alongside education as a legitimate use of music.

Despite Aristotle's objections, philosophical writing about music well into the Byzantine period continued to be influenced by Pythagorean and Platonic thought, particularly as refracted through Plotinus. Neoplatonist views of music were also expressed by the Fathers of the Christian Church, whose fierce polemic against secular music rested not only on the pagan origin of its texts and the suspect morality of its performers (cf. the *Apostolic Constitutions*, which denied baptism to instrumentalists who had not renounced their profession), but also on a belief in its inherently deleterious ethos. As an antidote, St John Chrysostom and other patristic authors proposed the cultivation of biblical psalmody, whereby a believer's soul would profit from the felicitous combination of text and melody. The doubts cast on the spiritual utility of the latter by such ascetics as St Athanasius and St Gregory of Sinai notwithstanding, the tradition of extolling melodious psalmody for its ethical benefits may be traced through St John of Damascus to the hesychast saints Gregory Palamas and Theoleptos of Philadelphia.

Treatises of music theory also demonstrate a remarkable degree of continuity from antiquity through the Byzantine period, the significance of which is much debated because of uncertainties about the degree to which theory and practice diverged after the 4th century BC as the academic study of music became firmly entrenched among the sciences. Ancient theorists pursued two basic approaches to the definition of tonal space, both of which may be regarded as approximate theoretical rationalizations of actual practice: the accurate but cumbersome Pythagorean tradition of defining musical intervals arithmetically according to ratios of string lengths; and the linear method of Aristotle's student Aristoxenus, who believed intervals to be capable of infinite subdivision and proffered scales built on units of equal size. All ancient theorists after Aristoxenus, however, followed him in constructing larger tonal systems spanning two octaves (the Greater Perfect, Lesser Perfect, and Immutable Systems) from sets of conjunct or disjunct perfect fourths. Whereas the outer notes of these tetrachords were fixed, the relative positions of their inner pitches were determined by their genus (diatonic, chromatic, or enharmonic) and "colour" (*chroa*). In the surviving fragment of his *Harmonics*, Aristoxenus gives the following sequences of whole (=1) and fractional tones for the tetrachord E-F-G-A:

Genus	*Sequence of Intervals (E - - - A)*
Tense diatonic	½ – 1 – 1
Soft diatonic	½ – ¾ – 1¼
Tonic chromatic	½ – ½ – 1½
Hemiolic chromatic	⅜ – ⅜ – 1¾
Soft chromatic	⅓ – ⅓ – 1⅔
Enharmonic	¼ – ¼ – 2

The theories of Aristoxenus were rearticulated in a group of treatises from the first few centuries AD, some of which modify them with material drawn from the Pythagorean tradition. These works include the comprehensive expositions of Claudius Ptolemy and Aristides Quintilianus, as well as the practical handbooks by Cleonides, Gaudentius, and Alypius, the last of which contains the fullest surviving account of the vocal and instrumental systems of ancient Greek musical notation. Manuscripts of these and other theoretical treatises not only continued to be studied and copied throughout the Byzantine period, but some treatises previously identified as

Late Antique may have been compiled at the court of Constantine VII Porphyrogennetos (913–59). Western scholars have nevertheless customarily dismissed Byzantine interest in the theoretical tradition of antiquity as encyclopedism covering an ever-widening gap between musical theory and practice. This hypothesis is currently being reconsidered by researchers who see evidence for a dynamic application of ancient theory to liturgical music in an enigmatic compilation known as the *Hagiopolites* (a 14th-century manuscript some of whose contents may be several centuries earlier), as well as in the discussions of modal theory contained in the late-13th-century treatises of Manuel Bryennios and George Pachymeres.

A more detailed evaluation of the links between ancient Greek and Byzantine music is frustrated by the chasm of approximately six centuries separating the sole fragment of a Christian hymn in ancient notation – the famous late 3rd-century "Hymn to the Trinity" from the Oxyrhynchus Papyrus 1786 – from the first manuscripts of Byzantine chant. When the latter finally appear, they do so with a modal system (the Octoechos attributed to St John of Damascus) that had undergone considerable development and completely new systems of notation (the various families of Byzantine neumes). Greek scholars have tended either to ignore these differences, or to see them as the result of evolutionary processes comparable to those that brought about the replacement of quantitative metres with others based on stress or syllable-count during the first centuries of the Byzantine empire. Employing the same evidence, Egon Wellesz and other Western pioneers in the study of Byzantine chant perceived a radical break with antiquity followed by development on a new basis. Wellesz notably argued that Christian liturgical song was derived primarily from non-Hellenic and especially Semitic sources, in particular the psalmody of the synagogue and Syriac hymnody. Without minimizing either the crucial influence exercised by Jewish precedents on the formation of Christian liturgy or that of St Ephraim the Syrian on St Romanos the Melodist, later 20th-century scholarship has called into question central elements of Wellesz's "Oriental hypothesis". His stylistic assessment of the Oxyrrhynchus hymn as non-Hellenic has, for example, been challenged by West, while advances in the study of Jewish and early Christian liturgy have discredited theories postulating the total dependence of the Christian liturgy of the hours and its psalmody on the synagogue.

Escaping simplistic binary oppositions between tradition and discontinuity, scholars of early Christian and Byzantine music began in the later decades of the 20th century to draw on more sophisticated developmental models from the closely related discipline of liturgiology. The repertories of Byzantine chant are thus viewed within their native liturgical context as the products of interaction over many centuries between regional traditions of worship ("rites") that emerged in the cities and deserts of Egypt, Palestine, Syria, and Cappadocia soon after Constantine's legalization of Christianity in AD 313. Geographic differences were transcended during this formative period by distinct cathedral and monastic approaches to the chanting of biblical psalmody, which dominated Late Antique services after all but the most venerable of non-scriptural hymns (e.g. the "Phos Ilaron") were proscribed as a defence against heresy. While urban services employed melodically interesting settings of psalms with refrains designed to encourage congregational participation, early ascetics cultivated musically austere practices of verse-by-verse performance (i.e. without refrains). These forms of worship were soon blended in hybrid "urban monastic" services, the existence of which is documented in Jerusalem at the turn of the 5th century AD by the Spanish pilgrim Egeria.

Following the Byzantine empire's loss of Egypt and Syria, the development of Byzantine worship and its music was governed by competition and borrowing between the liturgical families of Constantinople and Jerusalem. The former originally encompassed a monastic rite practised by so-called "sleepless monks" (*akoimetai*) and the cathedral rite of Justinian's Great Church of Hagia Sophia, a textually conservative system of cathedral worship notable for the splendour of its ceremonial entrances. Until its reform by Symeon of Thessalonica in the early 15th century, music in the Rite of the Great Church consisted mainly of antiphonal and responsorial psalmody performed by soloists (some of whom, prior to 1204, were eunuchs), choristers, and congregations. Non-scriptural hymnography played only a minor role in the "sung office" (*asmatiki akolouthia*) of the Constantinopolitan cathedral rite and was most frequently encountered in the form of refrains to psalmodic antiphons. The kontakia (verse homilies) composed by St Romanos and other melodists after Syrian precedents were originally composed for paraliturgical performance between the offices of a popular vigil (*pannychis*) and therefore constituted only a partial exception to the usual practice. In Palestine, on the other hand, the convergence between the local cathedral and monastic traditions of the church of the Holy Sepulchre and the monastery of Mar Saba that occurred after the destruction of Jerusalem by the Persians in 614 gave rise to a school of prolific hymnographers who composed works for interpolation among the psalms and canticles of the Palestinian liturgy of the hours. Sabaïtic hymnography became firmly established in Constantinople after St Theodore of Stoudios adopted the Palestinian divine office for use at his monastery in 799, thereby inaugurating four centuries of coexistence with the rite of the Great Church. The cathedral rite entered into steep decline after the Latin occupation of Constantinople (1204–61), leaving the rite of Mar Saba in its 14th-century Athonite recension to form the basis for all modern Orthodox worship.

The earliest Byzantine liturgical manuscripts with musical notation date from the 9th century. Initially, systems designed primarily to convey melodic or rhythmic nuances rather than precise pitch were employed: lectionary or "ecphonetic" notation for the recitation of scriptural pericopes, a system appearing in manuscripts from the 9th to the 14th century; and "Paleo-Byzantine" forms of melodic notation to convey the tunes of hymns and psalms from the 10th century. The latter included variants of the so-called Coislin and Chartres notational systems, thus named by modern scholars after the libraries in which they were first discovered, and respectively associated with, the traditions of Jerusalem and Constantinople. In the later 12th century the Coislin notation developed into a fully diastematic family of neumes ("Middle Byzantine" or "Round" notation) indicating a melody's precise succession of intervals with quantitative signs ("bodies") and its nuances with qualitative signs ("spirits"), the realizations of which continued to be transmitted orally and through cheiron-

omy, the lost Byzantine art of choral conducting. Although the available evidence precludes definitive reconstructions of premodern musical performances, it is more than sufficient to chart the development of Byzantine musical style from the appearance of notated manuscripts. The earliest transcribable books of chant contain fully formed repertories in several styles based on standardized melodic formulae. The Asmatikon and Psaltikon transmit anonymous choral and solo settings of psalms and hymns from the urban tradition of Constantinople in a florid idiom characterized by the occasional intercalation of meaningless syllables. Office hymns in a simpler melodic style by St John of Damascus, Kassia, and other composers of the monastic rite are contained in the Sticherarion and the Heirmologion. According to recent studies by Van Biezen (1968) and Arvanitis (forthcoming), the *stichera* (for an explanation of this term see the article on Hymnography) and canons in these collections of hymnography appear to preserve a certain modified form of pitch accent from ancient Greek music.

After the establishment of Crusader states throughout the eastern Mediterranean, Greek musicians were exposed to Western music through such institutions as the Lusignan court of Cyprus, the source of a remarkable manuscript of Latin chant and *Ars Nova* polyphony. Meanwhile, Byzantine chant continued to develop along established lines in a shrunken Palaiologan empire dominated musically by Constantinople, Thessalonica, and Mount Athos. St John Koukouzeles and a host of other eponymous composers began to cultivate distinct personal styles through the composition of multiple settings of psalms and hymns, breaking thereby the one-to-one relationship that had generally obtained between text and music in Orthodox worship. Many of their works were written in a virtuosic new "beautified" or "kalophonic" idiom employing textual troping, melismatic passages, and vocalizations on nonsense syllables (teretisms). Teretisms are found both as interludes within texted works and as independent compositions known as *kratemata* (see Hymnography), some of which bear evocative titles (e.g. "Viola" or "Persian"). In the 15th century, evidence of Western influence on Byzantine music in the form of settings of the Nicene creed and simple two-part polyphony appears amongst the works of the theorist (and later Uniate bishop of Methone) John Plousiadenos, and the imperial court musicians Manuel Gazes and Manuel Chrysaphes.

The fall of Constantinople to the Turks in 1453 left the Hellenic peoples split politically and musically into areas dominated either by Latin Christians or the Ottomans. Renaissance Crete, the Ionian islands, and southern Italy evolved distinct Western dialects of Byzantine chant often supplemented in performance by "chanting on the book" ("*cantare super librum*"), a practice of improvising polyphony that survives to the present day in certain areas. Some musicians, including Frangiskos Leontaritis (1518–72), a Cretan composer of polyphonic masses and motets, and Hieronymos Tragodistes (*fl.* *c.*mid-16th century), a Cypriot student of the Renaissance theorist Gioseffo Zarlino, also became fully proficient in the idioms of their Latin rulers. Following the Turkish conquest of Cyprus and Crete, Western forms of art music blossomed in the Ionian islands. Italian opera was staged in Corfu from at least 1733, laying the foundation for an indigenous Ionian school of opera composers led by Nikolaos Halkiopoulos-Manztaros (1795–1872) that flourished during the 19th century.

Analogous patterns of musical activity developed among the Romaic Greeks of the Ottoman empire after a 17th-century revival of Byzantine chanting centred on the Ecumenical Patriarchate. Working mostly within the stylistic categories bequeathed by their late-Byzantine predecessors, Panagiotes the "New Chrysaphes" (*c.*1623–*c.*1682), Germanos of New Patras (*c.*1625–*c.*1685), Balasios the Priest (*c.*1615–*c.*1700), and Petros Bereketes (*c.*1665–*c.*1725) enriched the received repertories with orally transmitted formulae (*theseis*) while creating the new genre of the kalophonic *eirmos* (model stanza). During this period it also became customary for Romaic cantors to acquire fluency in what was commonly referred to as "foreign music" (*exoteriki mousiki*), namely the Arabo-Persian art music of the Ottoman court. Zacharias Chanantes (also known as Mir Cemil, 1680–1750) and Petros Peloponnesios (Petraki-i Kebir?, d. 1778) distinguished themselves in both Byzantine and Ottoman music, a feat that was to be emulated by Romaic musicians well into the 20th century.

Musical life in Romaic communities during the 18th century was affected by the growing popularity of Western music among the Ottoman empire's bourgeoisie and an internal movement towards the systematization of the received repertory of Byzantine chant. The latter began with attempts to notate more fully the orally transmitted *theseis* through a process of transcription or "interpretation" (*exigisis*). This process was continued by Petros Peleponnesios and his student Petros Byzantios (d. 1808), who also offered their own revised versions of the Sticherarion and Heirmologion as alternatives to the embellished medieval and post-Byzantine repertories then in use, thereby laying the basis for all modern Greek chanting. Two attempts by Agapios Paliermos (d. 1815) to replace Byzantine neumes with forms of Western notation were defeated by conservative forces in the patriarchal chapel, but a third comprehensive reform proposed by Chrysanthos of Madytos (*c.*1770–1843) modifying the traditional system with borrowings from ancient Greek and Western music was accepted by the Ecumenical Patriarchate in 1814. Chrysanthos drastically reduced the number of qualitative signs in Byzantine notation, replaced the traditional intonations with a Western-style system of solmization, introduced precise means of notating chromaticism and subdivisions of the basic beat, and revived the Aristoxenian distinction between diatonic, chromatic, and enharmonic modes. Nearly the entire received repertory was transcribed into this "New Method" by Chrysanthos's associates Chourmouzios the Archivist (*c.*1770–1840) and Gregorios the Protopsaltis (*c.*1778–1821), whose works achieved widespread circulation in the first printed volumes of Byzantine chant. The "New Method" survived the challenge of a competing notational system introduced by George of Lesbos in 1840 and remains in use today with some modifications. In 1881 a Patriarchal Commission on Music corrected the scales of Chrysanthos, while more recently Simon Karas (d. 1999) revived certain qualitative signs from medieval Byzantine notation and, somewhat less successfully, proposed further minor revisions to the tunings of the Byzantine modes.

The history of music in the modern state of Greece has been marked by conflicting attempts to create popular and art repertories consonant with evolving conceptions of modern Greek identity that have alternately rejected elements of Italo-Greek and Romaic culture as unduly tainted by foreign influence. The task of creating a common musical idiom was initially complicated by the fact that none of the existing Hellenic centres of cultivated sacred or secular music fell within the borders of the small Greek kingdom that emerged from the revolution of 1821. While "folk" (demotic) song persisted among Greece's rural inhabitants, its new urban elite imported art and popular music from the Ionian islands and western Europe. Despite the grumbling of some traditionalists, king Otho's institution in 1834 of public performances by military bands and other similar efforts to broaden the audience for Western styles of music were generally well received. Two notable exceptions were attempts in 1836 and 1869 to introduce polyphony during Easter services at the cathedral of Athens, both of which were halted by rioting congregations. In 1870, however, at the instigation of queen Olga a polyphonic choir of men and boys was successfully founded in the royal chapel by Alexander Kantakouzenos (1824–92), formerly of Odessa. The following year Kantakouzenos became the first director of the Athens Conservatory, an influential institution that was one of many organizations founded in Greece during the last three decades of the 19th century to provide an expanding bourgeoisie with various styles of music, whether created abroad or, increasingly, locally. In addition to the introduction of French operetta, the 1870s witnessed the appearance of two competing styles of musical cafés, each of which attracted a highly partisan following: the *café chantant* as a venue for western European popular music and dancing, viewed as immoral by certain traditionalists; and the *café aman*, featuring an ethnically heterogeneous mix of popular musical repertories borrowed from the Romaic Greeks of Asia Minor and viewed by some westernizers as havens of debased Oriental culture. Parallel controversies over the relative merits of Western and Oriental musical styles occurred in the field of liturgical music, reaching their height in the first decade of the 20th century with the bitter disputes between the reformer John Sakellarides and the traditionalist Konstantinos Psachos.

Interest in the hitherto ignored tradition of demotic music was sparked among Greece's intellectual elite by Louis Bougault-Ducoudray's publication of a collection of 30 rural and Romaic popular songs harmonized according to his own classicizing theories of modality. The rather selective collections of his Greek imitators contributed to the institutionalization of a sanitized version of rural culture concordant with contemporary political ideology, while also providing some with a pretext to reject the Italo-Greek art music of the Ionian school in favour of central European ideas of musical nationalism. Advanced by George Nazos (1862–1934), a German-trained musician who drastically revised the curriculum of the Athens Conservatory upon his appointment as its director in 1891, this artistic reorientation climaxed with the emergence of a "national school" of composers led by Manolis Kalomiris (1883–1962) that claimed to draw its primary inspiration from demotic music. Kalomiris spent the second decade of the 20th century composing a notable series of works leading up to his Symphony no. 1, the *Levendia*, a paean to the "Great Idea" written between 1918 and 1920, while Dimitri Mitropoulos (1896–1960) bypassed the nationalism of his colleagues completely with *Soeur Béatrice*, an opera in French based on a text by Maeterlinck. The complexity of these ambitious compositions heralded the arrival of an era in which "serious" and "popular" music in Western styles began to develop along rather different lines in Greece, as elsewhere. The phenomenally successful operettas of Theophrastos Sakellarides (1883–1950) and other composers setting Greek librettos in a contemporary Viennese style were thus succeeded by popular songs in such foreign idioms as the foxtrot and the tango.

The burning of Smyrna and the destruction of its cosmopolitan musical culture in 1922 were succeeded over the course of the 20th century by the dispersal of Romaic musical communities throughout Turkey and the Middle East. At first, the exchange of populations mandated by the Treaty of Lausanne appears to have had little impact on Greece's recent achievement of a preliminary musical synthesis on a mostly Western basis. This was particularly true of "serious" music, in which the conservative "national school" held sway within the country until well after World War II, effectively banishing the works of Schoenberg's pupil Nikos Skalkottas (1904–49). Popular music was affected somewhat sooner by the revival of the *café aman* by the Asia Minor refugees, whose music soon began to mix with that of the urban underclass. The result was a bouzouki-based genre of popular songs known as *rebetika* that came to exist in parallel with what Voliotis-Kapetanakis (1989) has called the music of the "official culture", exemplified in the popular sphere by the cabaret music of Attik (Kleon Triantaphyllou, 1895–1944) and Michalis Souyioul (1905–58). As *rebetika* achieved commercial success through recordings and nightclub performances, they gradually lost their taboo status and evolved into *laïka* ("popular music"), a musically syncretic genre that transformed the bouzouki into a virtuoso instrument.

Greece's deep political divisions as it emerged from the 1940s were mirrored in music by conflicts between advocates of the increasingly outmoded cultural synthesis of the 1920s and partisans of genres stigmatized by their opponents as relics of oriental domination, represented at opposite ends of the social spectrum by Byzantine chant and *rebetika*. The intellectual foundations for a rapprochement between the two factions were provided notably by Simon Karas, who defended the integrity of the received tradition of Byzantine chanting through teaching and scholarship, and Manos Hadjidakis (1925–94), who scandalized Athenian musical society with a lecture in 1949 exalting *rebetika* as quintessentially Greek music. Hadjidakis went on to employ melodic and rhythmic elements of *rebetika* in his own compositions as he repeatedly crossed and ultimately transcended the boundaries between art and popular music, revitalizing Greek popular song and musical theatre during the 1950s with his eclectic style. The breaking down of cultural barriers in Greek music was soon carried further by Mikis Theodorakis (b. 1925), a student of Olivier Messiaen. Convinced of the cultural bankruptcy of the "national school" and inspired by socialist ideology, Theodorakis forsook the international career in avant-garde music chosen by his fellow Messiaen pupil Iannis Xenakis (b. 1922) in order to devote himself to the creation of what he hoped would be a truly representative Greek musical idiom

drawing stylistically on the bouzouki music of the lower classes. Theodorakis's penchant for setting the works of such highly regarded poets as Elytis and Ritsos in a popular style was imitated by others including Stavros Xarchakos (b. 1939) and Yannis Markopoulos (b. 1939), thus initiating the so-called "popular art song" (*entechni laïki mousiki*) movement. Composers who had similarly rejected the "national school" but refrained from immersing themselves in popular song included not only internationalists such as Theodore Antoniou (b. 1935), Yannis Chrestou (1926–70), and Anestis Logothetis (1921–94), but also Michael Adamis (b.1929) and Dimitris Terzakis (b. 1938), both of whom have applied avant-garde techniques to material of Byzantine and demotic origin. By the end of the 1970s, "popular art song" had largely run its course and Theodorakis returned to the creation of symphonies and other forms of art music as star performers eclipsed song writers in popular genres. Among the succeeding generation of composers, only Thanos Mikroutsikos (b. 1947) has achieved equal levels of success in popular and art music.

During the last two decades of the 20th century strife over Greece's musical orientation between East and West receded as large numbers of its people adopted an eclectic multi-culturalism embracing purist revivals of Byzantine chanting, demotic song, and Ottoman court music alongside Western rock, jazz, and early music. This process has been facilitated by growth of the Greek media and the long overdue construction of the Athens Concert Hall (Megaron), as well as by the founding of music departments at the universities of Thessalonica, Athens, and Corfu. Outside Greece itself, many musicians of Greek extraction have continued to distinguish themselves in a variety of genres. Christos Hatzis (b. 1953), Peter Michaelidis (b. 1930), George Tsontakis (b. 1951), and Tikey Zes (b. 1927) are among the composers of the diaspora who have created works drawing explicitly on Hellenic musical traditions.

Muslims

The presence of Muslims on Greek national territory can be traced back to the time of the Ottoman empire. Originally most of the Muslims lived in western Thrace – where they constituted the majority of the population until the 1920s – as well as in Macedonia, Epirus, and Crete. Their community included groups speaking Turkish, Albanian, Slavonic, and Greek. The majority of Cretan Muslims spoke Greek.

In Greek historiography, and often in popular tradition, the relation of the Muslims to the Christian Orthodox population tends to be described in terms of enmity; all the different Muslim groups tend to be lumped together and considered as Turks. This approach has its origins in the Greek–Turkish conflicts over the legacy of the Ottoman empire, during which Islam and Christianity were the official religions of two rival nations.

However, numerous shared traditions show that the Orthodox Christian and Muslim populations influenced each other in both cultural and social terms during the Ottoman period. A similar interaction is also evident in the religious sphere, at least in terms of popular religion. Syncretic ritual acts point to the interpenetration of Orthodox Christian and Islamic approaches to faith: the worship of saints, the holy places, and the graves of holy men are typical of both the

Balkan region and northern Greece. Historians of religion tend to attribute this to the influence of actual representatives and bearers of such syncretic religious traditions in the Balkans – the Dervish brotherhoods and the Bektashi order in particular. These rituals survive to the present day in the popular beliefs of many west Thracian Muslims, although they have probably moved some distance from their original content. Perfect examples are the cult of saints and the spring festival called the "Hidrellez". The latter is celebrated today on 6 May, mainly in the Rhodope region; at its origin is the interweaving of three different saint figures: Elias from the Jewish tradition, al-Hadr from the Muslim tradition, and George from the Christian tradition.

The minority status of the Muslim community in Greece is connected with the foundation of the independent Greek state, whose predominant religion, according to the Greek constitution (article 3 §1 paragraph 1), is Eastern Orthodox Christianity. The rights of religious and linguistic minorities within the newly proclaimed Greek state were protected under the London Protocol of 22 January 1830. Following the annexation of Thessaly and a part of Epirus to Greece (Treaty of Constantinople, 1881), large numbers of Muslims living in these areas came to be resident on Greek national territory. The Epirus Muslims were Albanians, known as "Tsamides". The Treaty of Constantinople (1881) went into some detail on Greece's obligations towards its Muslim minorities.

The Lausanne Conference of 20 November 1922 was a landmark in terms of the Muslim presence in Greece: among other things it decreed an "obligatory exchange of population" between Greece and Turkey along religious lines. Greek Christians living in Istanbul and Muslims resident in western Thrace were exempted from this compulsory exchange and from this time onward constituted minority populations in their respective countries. The Lausanne Convention on the Protection of Minorities laid down the obligations of both states towards the minorities living on their territories.

According to the first census in Greece after the Lausanne Convention, carried out in 1928, there were 102,621 Muslims living in western Thrace, the majority of them in the department of Rhodope. However, these Muslims did not form a unified community – at least three separate groups can be identified (by their language and by their distinct lifestyles within mainly homogeneous communities): Turks (Turkish-speaking), Pomaks (Slavophone), and Muslim Gypsies (speaking both Turkish and Romany). In addition there were numerically less significant groups of Circassians, Kurds, and a Turkish-speaking group of African origin. The Pomaks lived mainly in the foothills of the Rhodope mountains, the Turks mainly in the southern lowland and in the towns, the Gypsies mainly on the outskirts of towns and the southern lowland.

The Muslim community in central Greece (the "Tsamides") was gradually eliminated through repression, but the Muslim communities of western Thrace still exist today. They are the only officially recognized minority in Greece, and have been granted Greek citizenship since the 1920s.

After World War II the Muslim population in Greece increased through the annexation of the Dodecanese islands (Paris Peace Treaty of 1947). On the Dodecanese (principally on the islands of Rhodes and Cos) there were around 4937 Muslims, accounting for some 4.1 per cent of the islands' population. These Muslims have Greek citizenship but they are not recognized as a minority by the Greek state; nor are they protected by the Lausanne Treaty as this refers exclusively to the Muslims of western Thrace.

The highest religious and administrative body for the Muslim minority in western Thrace is the Mufti office. This institution is based on Articles 45 and 16 of the Lausanne Convention for the Protection of Minorities, itself based on the Treaty of Sèvres (1920). However, the introduction of the Mufti office ultimately derives from the Treaty of Constantinople (1881), which was subsequently extended by national legislation (for example, law ΑΠ/1882 of 22 June 1882, law 2345/1920 of 24 June 1920, and most recently law 1920/1991 of 24 December 1990). In 1923 there were three Mufti offices in Greece; the number rose to ten in January 1928 and to 12 in April 1928. In the meantime the number of Muslims had risen significantly due to the annexation of Epirus after the Balkan Wars. In July 1953 and after the elimination of the Epirus Muslims, the number of offices was reduced to three: these are still based in the west Thracian towns of Xanthi, Komotini, and Didymoteichon. Today, there is an additional Mufti office on Rhodes.

The Lausanne Treaty also provided for a special educational system (at primary level) for the Muslims of western Thrace, although the mainstream educational system was also open to them as an alternative. In 1997 there were 232 minority primary schools in western Thrace, with a total of around 8500 pupils. The minority schools have private status and are administered by the Mufti office. The schools' principal sources of funding are religious establishments (the *awqaf*), contributions by pupils, and in some cases subsidies from the Greek state. There are also some secondary-level minority schools alongside the mainstream educational system, run on the basis of a bilateral agreement between Greece and Turkey in those regions inhabited exclusively by Muslims. In addition there are two religious institutes (*medrese*) for training holy men. The Pedagogical Academy was founded in Thessalonica in 1968 to train teachers for the minority education system: only members of the Muslim community are allowed to study here.

The identity of the Muslims of western Thrace has been a subject of dispute between Greece and Turkey since the 1920s: Turkey rejects the description "Muslim", maintaining that the minority in western Thrace is exclusively ethnically Turkish. Greece, by contrast, sees this minority as consisting of fundamentally heterogeneous groups of Muslims and denies that the community as a whole can be defined as Turkish. The Pomaks were also a subject of latent conflict between Greece and Bulgaria up to the 1970s: Bulgaria regarded the Pomaks as Bulgarians who had converted to Islam and thus maintained that there was a Bulgarian minority in northern Greece.

Participation in parliamentary elections provides an indicator of the standing of Muslims in the Greek political system. Until the 1980s Muslim candidates were put forward only in the electoral lists of the established parties. The one exception was the "Tsamourgia" party of Epirus, which offered its own list of candidates in the 1926 parliamentary elections. After this Greece did not see another Muslim political party until 1985, when a Muslim party from western Thrace, called "Eirini" (Peace), took part in parliamentary elections in the

prefecture of Xanthi, albeit without success. In the years following this, two more parties were founded: "Empistosyni" (Trust) in Rhodope and "Pepromeno" (Fate) in Xanthi. However, members of the minority community still appear on the electoral lists of the established parties.

The exact number of west Thracian Muslims can only be estimated: the Greek official statistics office does not provide any data on the Greek minorities after the census of 1951. In terms of social standing, the Muslims living in western Thrace still belong mainly to the most underprivileged strata of Greek society, although some improvements have been apparent since the 1980s. Over the last 15 years the Muslim population has become far more mobile: large numbers of former farmers and tobacco producers (especially Pomaks) have been leaving the Rhodopes for the cities of the region. There has also been a significant increase in the migration of west Thracian Muslims to cities all over Greece, especially Athens and Thessalonica, and also to western Europe (mainly Germany).

See also Minorities

Summary

There have been Muslims in Greece since the time of the Ottoman empire, mostly in western Thrace, Macedonia, Epirus, and Crete, and since 1947 in the Dodecanese. The Epirus Muslims have been eliminated by repression. The western Thrace Muslims are officially acknowledged in the Lausanne Treaty of 1923. They are not a homogeneous group, being made up of Turks, Pomaks, and Gypsies.

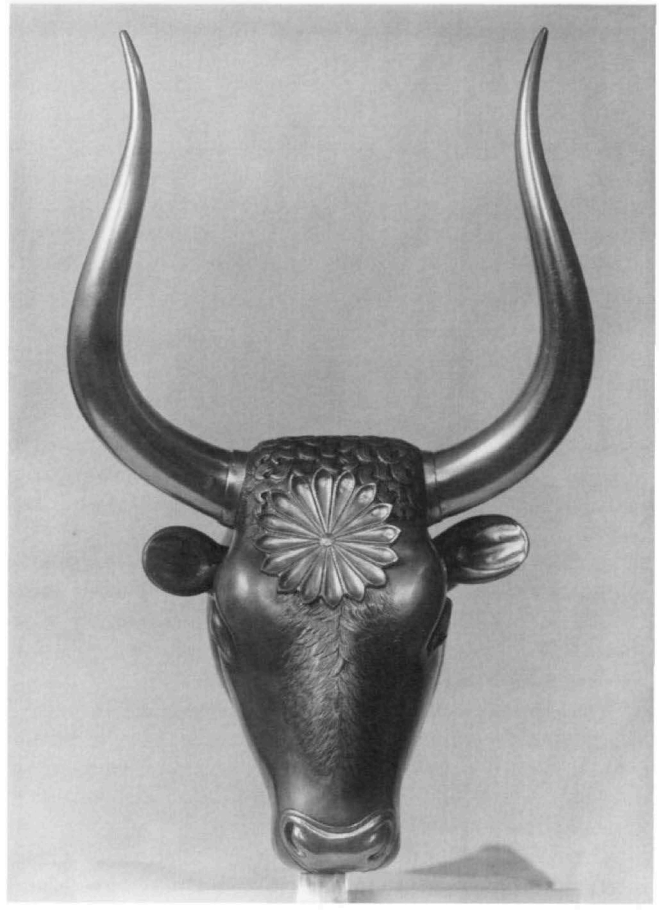
Mycenae

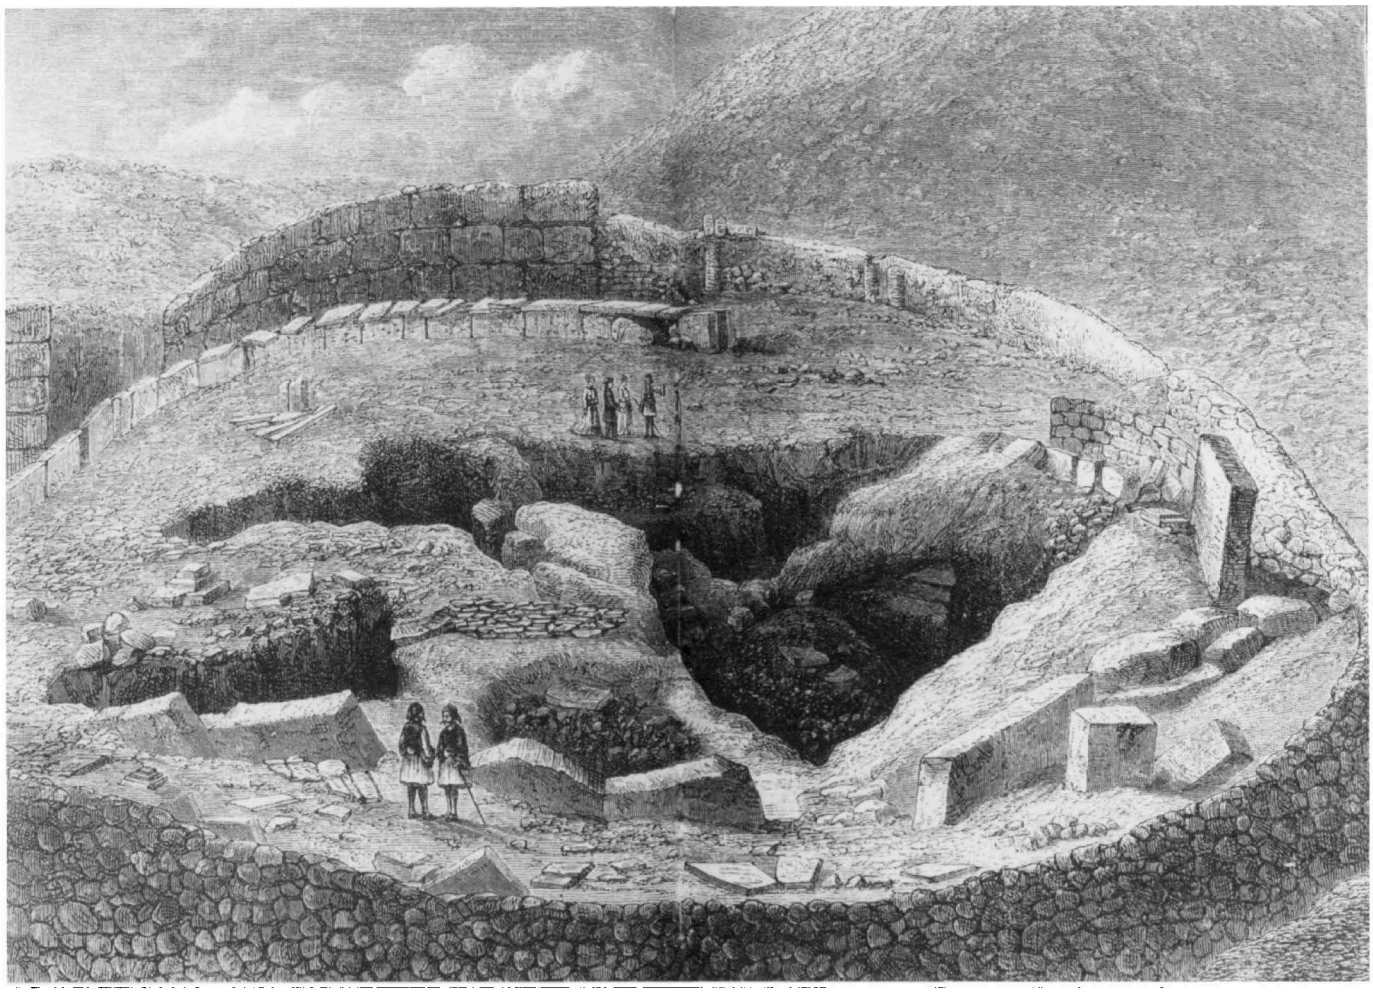
Bronze Age type site

Mycenae stands on a rocky knoll tucked into the northeast corner of the Argolid. Today it appears as a walled citadel with an external circuit of about 1 km. On the slopes to the north and west lie areas of settlement and beyond that at least 250 family chamber tombs in 27 separate cemeteries. These lie along a network of well-built roads which link the site to the rest of the Argolid and to the Corinthia to the north. The overall area thus used has been estimated at 32 hectares.

The site is known from Homer as the home of Agamemnon, leader of the Achaean forces before Troy, and has been the scene of archaeological investigation since the middle of the 19th century when in 1841 Kyriakos Pittakis completed the clearance of the Lion Gate on behalf of the Archaeological Society of Athens. Heinrich Schliemann's excavations of 1874 and 1876, which followed his work at Troy, disclosed the rich tombs now known as Grave Circle A and brought international renown. These finds form the spectacular core of the Mycenaean Room in the National Museum at Athens. The site has given its name to the Late Bronze Age civilization of mainland Greece but its remains are too rich for the site to be considered typical of that period. Subsequent research has been by the Archaeological Society: Panaiotis Stamatakis, Christos Tsountas, Ioannis Papadimitriou, George Mylonas, and Spiros



Mycenae: vase in the shape of a bull's head, Mycenae, 16th century BC, Ashmolean Museum, Oxford



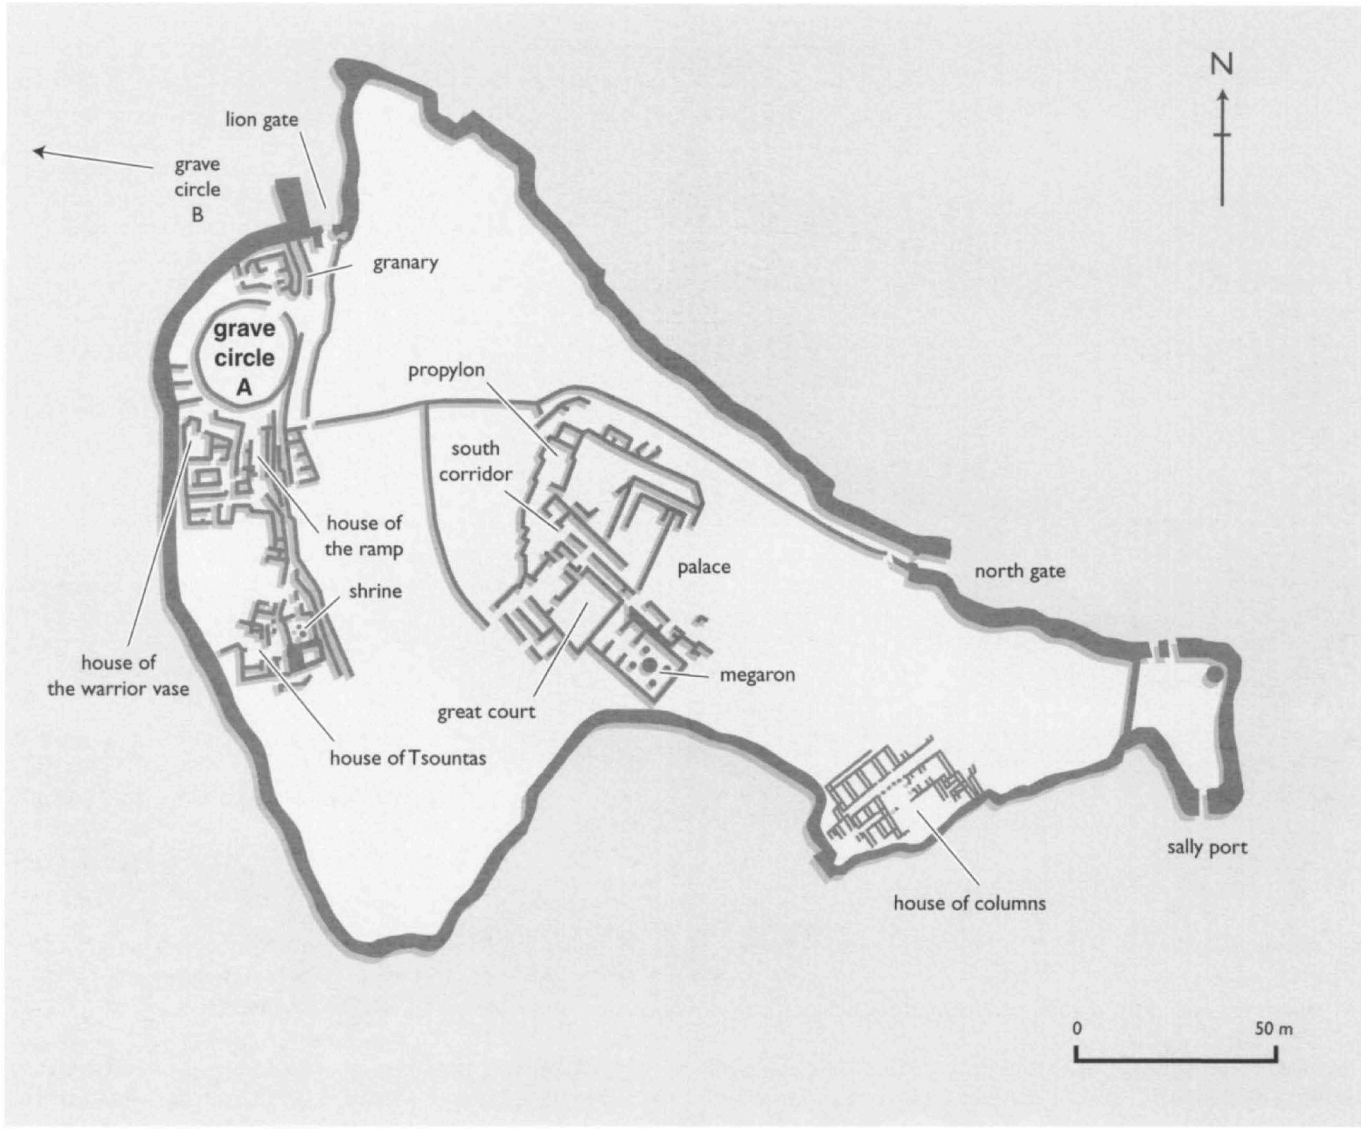
Mycenae: engraving from 1878 of Heinrich Schliemann's 1874 illustration of one of the grave circles at Mycenae

Iakovides, and (through the generosity of the Archaeological Society) by the British School at Athens (BSA): Alan Wace and Lord William Taylour. The site was mapped in 1887/88 by Bernard Steffen; an area survey by Iakovides and Elizabeth B. French (BSA) has recently been completed.

It is now known that the site was settled in the Neolithic period (6500 BC) but only became rich in the late Middle Bronze Age (*c.*1650 BC) when it seems to have taken over hegemony of the Argive plain from Argos. A series of warrior princes were buried in shaft graves (Grave Circles B and A) or, later, in built tholos tombs of which there are nine in total in three groups of three. There was a bureaucratic, centralized, possibly "palatial" society. Overseas links extended throughout the eastern Mediterranean and as far as Italy, Sardinia, and on occasion Spain to the west. It seems probable that it was the ruler of Mycenae to whom a letter from the Hittite king was addressed using the terms "Brother" and "Great King". At Mycenae itself, as elsewhere on the mainland of Greece and at Knossos, records were kept in the Linear B syllabic script, shown by the decipherment by Michael Ventris in 1952 to be an early form of Greek. This society collapsed around 1200 BC, probably as the result of earthquakes which disrupted the elaborate economic system. There was however no cultural break and the site continued to be inhabited, though by ever smaller numbers of people, until the Persian Wars when Herodotus says Mycenae, with Tiryns, sent a contingent of 400 to fight at Plataea. The name is inscribed on the serpent column which originally held the memorial tripod for this battle at Delphi but was later removed to the Hippodrome at Constantinople. The continued inhabitation of the site may have been linked to its control of Argive religious centres or to its position in Greek mythology. As well as an Archaic temple (of Hera or Athena) on the summit of the acropolis, there are Archaic dedications at the Treasury of Atreus and a shrine with dedications to Agamemnon of Hellenistic date, though the shrine itself originated in the late Geometric period. It has been suggested that this timing may reflect the circulation of the Homeric poems.

In 468 BC the town was attacked and captured by Argos and its fortifications disabled. The 5th-century BC tragedians, when dealing with the myths of the Oresteia cycle, mix Mycenae and Argos. Details in Aeschylus' *Agamemnon*, particularly the account of a series of beacon stations linking to Troy, seem to belong to Mycenae itself and the naming of Argos is thought to reflect political considerations at a date, 458 BC, soon after the downfall of the site. Schliemann thought that Euripides must have known the site in order to describe it so tellingly.

In the Hellenistic period Mycenae was revived as a *koma* or fortified settlement by Argos; the citadel walls were repaired, the lower town enclosed by a wall, the temple rebuilt, and a theatre and fountain house built. This town gradually declined



26. Mycenae

and by the 1st century BC to the poets of the *Greek Anthology* (notably Alphaeus of Mylitene) had become a byword for faded glory. However, in the 2nd century AD Pausanias saw monuments which can be related to the site as known today, particularly the Lion Gate itself and the tholos tomb which he called the "Treasury of Atreus".

Though well known by name, the site is not correctly positioned on maps until the late 18th century and the Lion Gate is not mentioned after Pausanias until a Venetian document of 1700. Some damage was done to two tholos tombs (those known as the Treasury of Atreus and the Tomb of Clytemnestra) by Veli Pasha in the early 19th century and both Lord Elgin and Lord Sligo brought back pieces of the facade of the Treasury of Atreus which are now in the British Museum. The lion sculpture over the main gate was luckily considered too heavy to move. During the 19th century the site was frequently visited and was illustrated mainly in watercolour by many travellers, but it has appeared in literature, either Greek or other European, less frequently. Sartre's terrifying *Les Mouches* is once again set in Argos. A notable exception is Sacheverell Sitwell's *Agamemnon's Tomb*, reflecting an aspect little felt by the modern tourist.

ELIZABETH FRENCH

Summary

The citadel of Mycenae occupies a hilltop in the northeast corner of the Argolid. It flourished in the Middle to Late Bronze Age (1650–1200 BC) as the centre of a warrior society. Impressive grave goods and documents in Linear B have been found. The site continued to be occupied on a smaller scale until 458 BC and was reoccupied in the Hellenistic period.

Mycenaeans

"Mycenaeans" is the term applied both to the inhabitants of Mycenae itself and to the inhabitants of the whole of southern and central Greece (as far as Mount Olympus) in the Late Bronze Age (1600–1050 BC). The term was also originally used by Sir Arthur Evans for the inhabitants of Crete at a similar date before, in 1905, he put forward the new term "Minoan".

It is now known for certain, since the decipherment in 1952 by Michael Ventris of their written language in the Linear B script, that the Mycenaeans were Greeks. It is still a matter for debate when this Indo-European people entered Greece or if the language developed in situ from the original core. A common interpretation of the evidence postulates that they can be identified as immigrants from northwest Anatolia whose different, rather inhibited, culture can be widely seen in the closing years of the 3rd millennium BC.

By about 1600 BC a warrior elite had come to power at a number of centres, notably in Messenia and at Mycenae. The growth of wealth among this group can clearly be traced in the finds from Grave Circle B at Mycenae, followed by those of Grave Circle A. The presence in the 15th century BC of single tholos tombs at various sites suggests the model of Early State Modules which become linked through vassaldom, intermarriage, etc. This structure can still be seen in the Homeric poems, especially the Catalogue of Ships, which appear to reflect Bronze Age conditions with adjustments for later political factors.

The simple basic culture of the late Early Bronze Age and the Middle Bronze Age developed with the access of wealth and under Cretan artistic inspiration (and possibly actual craftsmen). However, it retained its separate identity and is notable for the stylization of natural motifs into symmetrical often heraldic patterns and for the portrayal of warfare with only the rarest representations of the actual rulers in any guise.

Between 1400 and 1200 BC the influence of the Mycenaeans grew throughout the Mediterranean. They had contact, presumably from trade, with an area stretching from Sardinia in the west to the Levant coast in the east and to the north into Albania and Macedonia. Sporadic Mycenaean imports are also found in Egypt. Current research is investigating the degree of acculturation which resulted in the various regions with which they had contact. The growth of power and influence caused the culture to become more centralized and an elaborate bureaucracy is attested in the Linear B documents. Artefact production seems, from what has been preserved, to have changed from elite specialities to bulk manufacture.

The second half of the 14th century and the 13th century formed the acme of Mycenaean influence. The term *Ahhiyawa*, as used in Hittite texts, seems to refer to the Mycenaeans during this period; the ruler is on one occasion refered to as "Great King", a term usually employed for the ruler of Egypt and other major contemporary states.

At the end of the 13th century BC a series of disasters, possibly the result of earthquake or climatic instability, caused the collapse of the centralized bureaucracy. Though the period called Mycenaean continued until the mid-11th century BC, the artistic and cultural activity of the various regions of Greece is more diverse and there is no further evidence of literacy. By the point at which the hallmark stirrup jar is no longer produced, the Mycenaeans can be considered to have given way to the more obviously direct ancestors of the Classical Greeks.

The later Greeks were well aware of their ancestors of the Mycenaean period, though the term "Mycenaeans" is never used to refer to them. In Homer the adjective applies only to the people of the city itself. It was once thought that this awareness was not the result of cultural continuum from the Bronze Age but resulted from the rediscovery of tombs of Bronze Age date, often assigned to heroes, and from an interest in the past revived by the epics of Homer. Archaeology has now shown this not to be the case; for instance the "heroic" burial at Lefkandi in Euboea dates to the 10th century BC but is of Homeric type. The influence of this legacy on the development of myth and of legends associated with local heroes is much discussed. Homer is now thought to reflect a mainland oral tradition. The cumulative result is seen in all the surviving works of ancient authors, from Hesiod to Pausanias. The respect accorded to heroic ancestors, whether genuine or invented, is epitomized by such events as the diversion of Alexander to make offerings at the supposed tomb of Achilles in the Troad.

Summary

Mycenaeans were not only the inhabitants of ancient Mycenae, but those of all southern and central Greece in the Late Bronze Age (1600–1050 BC). Their script, known as Linear B, is an early form of Greek. They were a wealthy warrior society with trading contacts throughout the Mediterranean. The Classical Greeks were aware of these ancestors but did not refer to them as Mycenaeans.

Myrivilis, Stratis 1892–1969

Novelist

A sarcastic narrator, a nostalgic extoller of the Greek pastoral landscape, and a fervent exponent of the human condition, Myrivilis was the initiator of the war novel in Greek literature. He also made a tremendous contribution to the emergence and perfection of war literature as a particular literary genre while, at the same time, playing a substantial role in the development and emancipation of the so called anti-war, humanist movement in modern literature.

Myrivilis produced an amazing variety of work ranging from novels and short stories, to poems, essays, critical treatises, and reviews. His best-known works include *Kokkines Istories* (Red Stories, 1915) and *Oiigimata* (Narrations, 1928). The publication of these two collections of stories – in the aftermath of World War I and the Asia Minor disaster respectively – inaugurated the first phase of war literature in Greece. As Myrivilis's reputation grew, he proceeded to write some of his most lengthy, wide-ranging, mature novels including *I Zoi en Tapho* (Life in the Tomb, 1924), *I Daskala me ta Chrysa Matia* (The Schoolmistress with the Golden Eyes, 1933), *O Argonavtis* (The Argonaut, 1936), and *I Panagia i Gorgona* (The Mermaid Madonna, 1949). These works signified the second, most fertile phase of Greek war literature, which laid the foundations for the subsequent arrival of the anti-war dimension in literature.

Myrivilis's novels were marked by a density of personal style as well as an artfully elaborated, flawless expression. His novels are characterized by the use of well-structured phraseology and a stimulating imagery able to recreate and intensify the war experience. Although Myrivilis was mainly preoccupied with the overriding theme of his novels, he never underestimated the significance and primary role played by linguistic skill, style, expression, and idiom in a literary work.

Myrivilis participated in the Balkan Wars (1912–13) by joining the front line as a volunteer, in World War I, and in the military expedition in Asia Minor. Having experienced the brutality and bloodthirsty inhumane reality of war, he wrote about his own experiences and relayed his anti-war message to future generations. By persistently describing the barbarous reality of fighting and depicting the animal instincts of the people involved in it, he attempted to exalt the value of life itself as the most precious gift of human existence. Indeed, the context of his work acquired a special importance, its character magnified in his readers' minds to an extent that they would consider both his life and work as if they were crystals produced in reaction to the times.

The unique elements of Myrivilis's work have to do with the particular perspective he endorsed, as well as his distinct outlook. He experienced war and he succeeded in describing its drama in every possible detail from the position of a simple soldier of the front line or the trench, and not that of the senior officer or the politician. By adopting this point of view, he spelled out the individual man's experience of war, the central place occupied by his feelings, instincts, necessities, passions, and the need for survival. In this way, Myrivilis expressed his denunciation of war and set himself against those whom he held responsible for the outbreak and continuation of such a misery. By emphasizing the contrast between the condition of life in peace and death in war, he was able to dispatch his anti-war message. Such a treatment of his subject combined with the deployment of realistic imagery of the moment of war reminiscent of Homer or Thucydides made him a traditional writer. By selective use of the ideas and methods of earlier war writers, Myrivilis produced a synthesis of utterance with which he continued to deplore combat. At the same time, he recognized a change of circumstances (not of a deeper reality) from those experienced by previous writers. His great contribution to the Hellenic literary tradition lies in the fact that he prepared the way for an entire generation of war authors to follow, such as Ilias Venezis, Angelos Vlachos, Angelos Terzakis, Loukis Akritas, George Theotokis, Alexandros Kotzias, Thitho Sotiriou, and Nikos Kasdaglis.

Myrivilis's world of ideas is (as one might expect of a developed writer) not so much the expression of a simple idea, or even of different ideas joined together; it is much more the work of one idea developed in opposition to itself, and in this he expressed precisely his central dilemma as a humane, creative person occupied more or less efficiently in the activity of slaughter. As a fighting man dedicated to the arts of peace, his life, like that of most other soldiers, could not be other than contradictory; and in that paradox the expression of his position is founded on a dilemma.

Myrivilis preached extensively in his novels the value of life and peaceful human existence. Having experienced the destructive reality and madness of the most barbarous collective activity of humankind, he soon discovered the anti-heroic, corruptive, and humiliating boredom of the trench and recognized the imperishable nature of human life. In such awareness lies the innovative quality and didactic element of his writing. The traditional heroic spirit of the Greeks that characterized their never-ending struggle for peace seems to wane before the mystery of life and the grandeur of human nature. This does not mean that the writer separates himself from the tradition but, on the contrary, he declares his intention to go one step further. By raising his anti-war voice, he claimed that the continuation and preservation of tradition could be achieved only through life. Human existence for Myrivilis reflects God's goodness and is the evidence of His handiwork. Such a perspective resulted in influences from the biblical tradition in which God is identified with life and beauty. However, Myrivilis goes a little further in identifying life with the inner human soul. To discover the meaning of life is to discover your psyche. At this point, his work seems to elicit a deeper religious existential thinking. His work is a synthesis of Homeric ideas, Christian thought, and folklore morality. This is why he is

regarded as a link between the philosophical polytheism of ancient Greece and the monotheism of Christianity.

Another frequently analysed idea in Myrivilis's work is that of the vital need for shared human contact. The writer opposes the condition of the solitary man. This shows how two principles of Aristotelian philosophy exerted a profound influence on Myrivilis: that man is by nature a social animal and that man cannot live alone, otherwise he becomes either God or beast. Myrivilis also draws attention to the idea of Rousseau's primitive human soul and proceeds to compose an encomium for the primeval unspoiled innocent soul.

By his ability to merge the lyric and epic elements in his novels without losing the balance between them, Myrvilis produced allegorical didactic novels which gave expression to his talents and his alert conscience. His work is consistent with War in a wider context than the war offers, so that for him the focus of his novels is an idea of the otherness and the confining totality of experience. His characters are strongly built just like the figures of the biblical or tragic tradition. In this manner, he especially influenced the construction of Venezis's characters.

For these reasons, Myrivilis's writing works both as a moral agent requiring an alteration in the reader's psyche and thus in the conduct of society, which is made up of these readers; but it also functions as a literary artefact.

MARIA ROUMBALOU

Biography

Stratis Myrivilis was the pen name of S. Stamatopoulos who was born on Lesbos in 1892. He took part in the Balkan Wars, the First World War, and the ill-fated expedition to Asia Minor. In his novels he wrote about the bitter experience of war. He also wrote short stories, poetry, essays, and reviews. He died in Athens in 1969.

Mysticism

The term "mysticism" is a neologism. It is, in fact, characteristic of the Greeks not to have invented a separate, abstract, term for the kind of experience they deemed inseparable from true philosophy and theology. What we do have in Greek are terms for "mystery", "mystic", and "mystical", deriving from the verb *muein*, to close the eye, to initiate into the mysteries. These terms denote that which is hidden, that which lies beyond the realm of ordinary existence. In this essay we shall take a broad definition of mysticism: the quest for, and experience of, unmediated contact with the divine.

Alongside the anthropomorphic polytheism of Greek religion there was an alternative form of religion represented by the mystery cults. These offered a direct apprehension of the divine unattainable within the civil religion. Of these cults the Eleusinian and Dionysian mysteries are of particular importance. The origins of the Eleusinian mysteries are pre-Hellenic. They consisted in the re-enactment of the myth of Demeter, the earth-mother, and her daughter Kore, or Persephone. They involved several stages of initiation, producing fellowship with the goddesses and culminating with the beholding (*epopteia*) of the revelation of these deities at the shrine of Eleusis. The Dionysian mysteries went beyond the Eleusian in seeking actual possession by and union with the deity. This was to be attained through rites of an orgiastic character in an outgoing of consciousness, or ecstasy. Both cults were associated with the triumph over death and the rebirth into immortality. The myth of the death and rebirth of Dionysus became a prominent feature of the Orphic movement, active from the 6th century BC. The Orphics sought deliverance from the cycle of transmigration and reincarnation through union with the divine, understood not merely as a transient ecstatic experience but as a permanent state of blessedness.

Plato's philosophy has a profound mystical element. His philosophy was pre-eminently a way, a means whereby man might reacquire true, participatory knowledge of the real, the eternal. The way's end is variously described: it is Being in the *Phaedo*, the Good in the *Republic*, Beauty in the *Symposium* and the *Phaedrus*, and the One in the *Philebus*. Unawakened to the real, eternal world, man perceives only the phenomenal world, the world of sense perception. In his famous cave simile Plato compares the situation of the unawakened to men shackled in a cave, able to see only the shadows of those who pass by behind them. Reawakening to the real world, the noumenal world of ideal Forms, is a painful but necessary experience. From that awakening one must strive for the apprehension of the transcendent reality that is the source of all that is. This way of contemplation and of intuitive, participatory, knowledge is a guiding principle in Plato's work. It is, for example, the way that the rulers of the city state must follow. It was to be an important influence in shaping the Christian mystical tradition.

The mystical way enunciated so clearly by Plato suffuses much of the Hellenic philosophical tradition. Aristotle, notwithstanding the many differences he had with his master, speaks of the contemplative life as a participation in the divine life in which the subject–object distinction between man and the divine disappears. The successors of Plato elaborated the mystical element in his work. The Stoicized form of Platonism known as Middle Platonism, which held sway roughly from the 1st century BC to the 3rd century AD, developed a much clearer idea of the transcendence of God, as opposed to the divine, than that found in Plato himself. It was against this

intellectual background that many of the most outstanding examples of Hellenic mysticism emerged.

The work of Philo (late 1st century BC–mid-1st century AD) represents a form of Judaism profoundly shaped by the Middle Platonism of his day. Philo presents God as radically unknowable in himself but made known in his powers or operations. This distinction, not original to Philo, was to have a long and eventful history. For Philo, God reveals himself according to man's capacity to apprehend him. To describe this process of revelation, Philo does use the language of the mystery religions, although he was not directly influenced by them. He describes the soul's journey to God as beginning with conversion and the recognition of the createdness of the universe. Through moral purity the soul comes to know itself and to recognize its utter dependence upon God. Knowledge of God is a divine grace, not a natural capacity. It entails a going out of oneself, a form of ecstasy seen most clearly in the Hebrew prophets. The shining of the light of God within entails the suspension of the faculties, entails "ecstasy and divine possession and madness". In such a state the soul is "superior to man but less than God".

The Hermetic movement that developed in Egypt in the first three centuries of the Christian era made some use of the Egyptian religion, and certainly drew upon Judaism, but was profoundly Hellenic in inspiration. The Hermetic texts present a guide to mystical experience, viewed from a variety of standpoints. They speak of God as ineffable but knowable by man by virtue of man's divine nature. The great evil is ignorance; the mystical way consists therefore in the reacquisition of self-knowledge, which is knowledge of the divine, and the ascent to the ecstatic vision of God in which man is deified, or rather realizes his own divinity.

The extraordinarily complex and seductive set of traditions known as Gnosticism posed a grave threat to Christianity in the first three centuries of the Christian era. While teachings and practices varied greatly, Gnosticism was essentially an attempt to present Christianity as a mystery religion, analogous to the mysteries of Mithras, Cybele, and Isis that were flourishing at the time. Teaching a radical form of dualism between God and the world, the Gnostics offered an initiatory form of knowledge whereby those who had a divine spark within them might escape from the material world and find salvation. Gnostic dualism found a new expression in the 3rd century AD with the rise of the Manichaean religion.

The finest example of Hellenic mysticism is to be found in the teachings of Plotinus (AD 204–70), founder of the tradition known as Neoplatonism. Plotinus took up the perception of the transcendence of God found in Middle Platonism and developed it into a thoroughgoing statement of divine incomprehensibility. Plotinus' teaching is centred upon the soul's ascent to reunion with the One. We know from his biographer, Porphyry, that Plotinus himself experienced mystical union with the One on several occasions. Plotinus teaches a way whereby the obscurities and accretions of the material life might be removed and the return to God accomplished. Plotinus had a far more positive attitude to the material world than did the Gnostics, but is at the same time unequivocal in his understanding that the material is to be left behind on the soul's journey back to God. The return to the contemplation of God in Plotinus is also the return to oneself. It is a return to the vision of light in which the subject–object distinction between man and God disappears, in which the soul becomes that light, being "raised to Godhood or, better, knowing its Godhood". Centre coincides with centre: "This is the life of gods and of the godlike and blessed among men, liberation from the alien matter that besets us here, a life taking no pleasure of the things of the earth, the passing of the alone to the Alone."

The Christian mystical tradition took up and reshaped many features of the mysticism of the Hellenistic period, being principally indebted to Philo and Plotinus. Indeed, while Philo's influence on the Jewish tradition was initially minimal, and many of Plotinus' successors lapsed into theurgy, or magic, it was the Christians who preserved many of the insights of these two great teachers within the context of a living tradition.

Clement of Alexandria integrated much of Philo's mystical teaching within the Christian tradition, most notably the motif of the divine darkness of Mount Sinai used to express God's incomprehensibility. Clement went beyond Philo in speaking quite unambiguously of man's deification. Like Philo, Clement used the language of the pagan mysteries to describe the mysteries of his own faith: "O truly holy mysteries, O light undefiled. I am led by the torch-bearer to be initiated into heaven and God. Through initiation I become holy; the Lord is my hierophant and as one-who-leads-by-light [*photogogos*] seals the votary for himself." We should not forget how attractive this sort of language would have been to the 2nd-century Alexandrine ear.

Origen's work has a deeply mystical character, something that those familiar only with his *On First Principles* and *Contra Celsum* can be prone to overlook. For Origen the mystical life is a realization of the union with Christ effected at baptism. His *Commentary* and *Homilies* on the Song of Songs develop this theme. Origen takes Proverbs, Ecclesiastes, and the Song of Songs to refer to the three stages of the ascent to God, that is, to the acquisition of the virtues, to the proper understanding of the natural world, and, finally, to enoptic, or inspective, contemplation of God. In this understanding, the goal of the mystical life is union of the spiritual intellect, or *nous*, to God through contemplation. It does not entail ecstasy.

The Alexandrine mystical tradition formed a crucial component of the teaching of the Cappadocian Fathers. This is most evident in St Gregory of Nyssa's *Life of Moses*. It is also apparent in the works of Evagrius of Pontus and pseudo-Macarius. Evagrius made Origen's threefold distinction of the spiritual life classic. He also refrains from speaking about ecstasy. Macarius is less reserved, and speaks of the intellect as "utterly suspended and ravished", carried away by prayer and become one with it. He also follows Clement and Philo in using the phrase "sober drunkenness", a motif avoided by both Origen and Evagrius.

There was a danger in the Christian usage of the Hellenic mystical tradition that the mystical life would be seen as circular, as an escape from matter and a return to pre-cosmic unity. This element of circularity is palpable in the teachings of Origen and Evagrius. It was avoided by the Cappadocians and by Macarius in their emphasis on personhood and the integrity of the body. Union with God in these writers has no connotations of reabsorption into the divine. The teachings of pseudo-Dionysius the Areopagite, deeply influenced by the Neoplatonism of Plotinus and Proclus, do not adequately

avoid the dangers of circularity. While their wonderful evocations of the suprarational and ecstatic apprehension of God in the state of perfect unknowing were to be enormously influential, they lacked the personalistic element so vital to true Christian mysticism.

St Maximos the Confessor produced in the 7th century an original and creative synthesis of the eastern Christian mystical tradition. Maximos built on the synthesis between Macarius and Evagrius made by Diadochus of Photice in the 5th century. Using the Cappadocian emphasis on the person, he was able to integrate the valuable insights of the Areopagite within his own synthesis. Maximos's theology is governed by mystical experience. His defence of the two wills – divine and human – in Christ was based not on abstract theological principles, but on the lived experience of the saints of the synergistic and personalistic character of union with God.

The vision of the divine light recounted so vividly by St Symeon the New Theologian is an illustration of the eastern Christian mystical tradition at its most vibrant and audacious. The nature of that light, which the hesychast monks also claimed to witness in prayer, became the subject of controversy in 14th-century Byzantium. The recognition by the Church of the divine nature of that light is a further example of mystical experience being taken as normative in the formulation of Christian doctrine.

It is examples such as these that led the Orthodox theologian Vladimir Lossky (1903–58) to declare that in the eastern Church there is no theology without mysticism and vice versa. The eastern Church has certainly been less susceptible than the West to the tendency to separate theology from mysticism. It has not, however, been immune. The *Philokalia*, for example, was produced to combat just such a separatist tendency that was very evident in 18th-century Greece. There has been a revival of interest in the theory and practice of the eastern Christian mystical tradition in the latter part of the 20th century. Against the prevailing academicism of the theological schools and the Protestant moralism of the Brotherhoods, a renewed interest in the well-springs of the Christian mystical tradition has become evident, for example among the circle of theologians influenced by the "Paris school" of Orthodox theology. This revival has also been very evident on Athos in recent years, somewhere where the mystical tradition has never died, but has often been very hard to find.

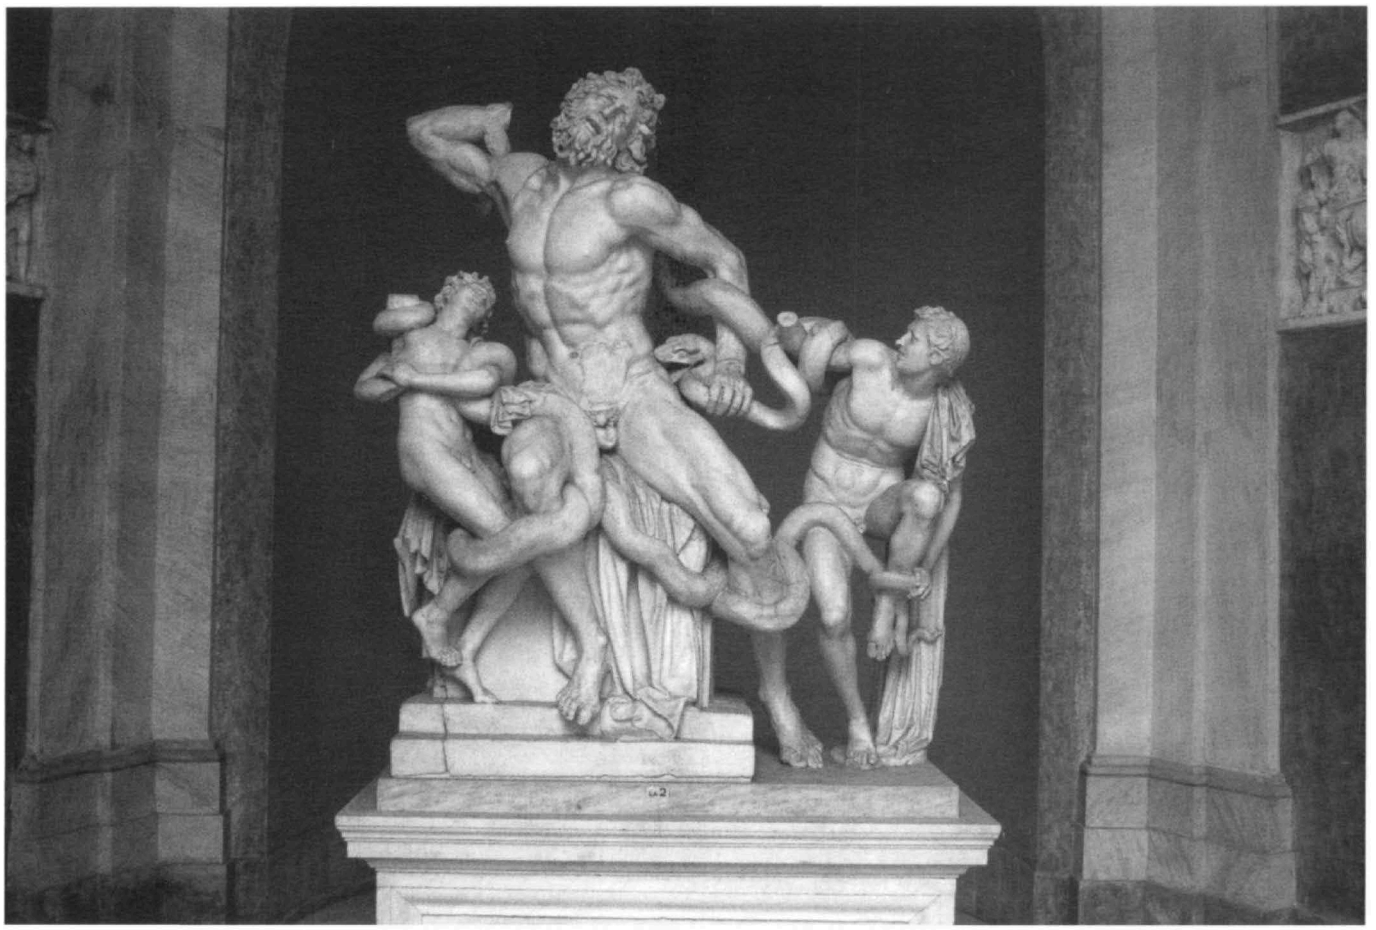
Mythology

The Greek word *mythologia*, which occurs for the first time in Plato, simply means "storytelling". But in modern usage "mythology" refers both to the corpus of myths and to its systematic study. Taken in the former sense, Greek mythology consists of a large number of stories about gods, heroes, the nature of the cosmos, and religious practices. According to one well-known classification associated with early 19th-century folklorists and students of non-classical legends, including the brothers Jacob and Wilhelm Grimm (cf. H.J. Rose, *Handbook of Greek Mythology*, (1964), ch. 1), these stories consist of three main types.

(1) Myths proper, i.e. pre-scientific and imaginative explanations of real or supposed phenomena which appeal to emotion rather than reason. As these phenomena are mostly natural, nature myths are preponderant. The stories are mainly concerned with gods, their birth, their relationship to one another, victories over monsters and rivals, love affairs, special powers, connections with shrines, or rituals. They are often aetiological in purpose, in that they attempt to provide explanations of phenomena which appear wonderful or puzzling. They are concerned with the causes of all manner of things from apparent movement of the heavenly bodies to the shape of a neighbouring hill or the origin of a local custom.

(2) Legends or sagas, i.e. accounts of heroes who were thought of as actually having lived in the distant past and as having taken part in quasi-historical events, such as battles and adventures, which were generally accepted as actually having happened. Thus the story of the Trojan War, whose origin tradition traced to Paris' abduction of Helen, is thought to reflect a concerted attempt by the Achaeans, a conquering feudal aristocracy, to seize the Black Sea trade at the beginning of the 12th century BC. It seems to have consisted in a blockade of the fort of Ilium, thus interrupting Trojan communication with neighbouring countries, and the issue seems to have been decided by the economic and military exhaustion of the Trojans which led to the subjugation of the cities allied with them and finally to the fall of Ilium itself. Thus the story is based on some kind of memory of the past and, with the exception of the part played by the gods (which really belongs to myth proper), the progress of the war is described in largely realistic terms. It is a human story unfolding in a human environment. With constant repetition through many generations such legends undergo all sorts of mutations – additions (mostly of imaginary and therefore picturesque material), omissions (mostly of real details), modifications, and rehandlings. Occasionally, the story may be completely fictional, but it will nevertheless be modelled upon real semi-historical narratives. On the other hand, there are instances of fragments of real history being preserved in legends of the peasantry over an extraordinary length of time.

(3) Folk tales told for popular entertainment, mostly stories of adventure dealing with natural or supernatural matters. Varieties include fairy tales, animal fables, and stories about witches, giants, ogres, and magical objects. Despite these supernatural elements, the main character is generally a human being, usually of humble origin, striving to achieve a human goal in spite of, or with the help of, such fantastic forces. The theme may also be a contest or trial, e.g. to defeat a monster



Mythology: marble statue group of the priest Laocoon and his sons being attacked by serpents, *c.*50 BC, Vatican Museums, Rome

or win a bride; or it may involve a more domestic challenge such as circumventing a malicious stepmother or jealous brothers or sisters. Many of these characteristically involve trickery or ingenuity or the use of magic. There may also be an element of wish fulfilment or the acquisition of a treasure or a great reward for apparently small but often highly moral actions, such as the solving of a riddle. A story, such as that of Cadmus, Perseus, Heracles, or the Argonauts, may contain elements from more than one of these types.

The ancient Greeks themselves had various attitudes to their myths. Some people no doubt accepted them as literally true and considered their narratives to be historical accounts. However, many thoughtful people must have found it difficult to accept them or their implications. Their reaction was broadly twofold: rationalization, which appears to have begun with Hecataeus of Miletus (550–480 BC); and allegorization, which probably began with Theagnes of Rhegium in the 6th century BC and, through its use by the Stoics, persisted until late antiquity and survives in the work of some early Christian writers and artists.

Myths performed a number of important functions in ancient Greek society in the various spheres in which they were employed. Turned into epic, they served to preserve and immortalize the famous deeds of men (*klea andron*). They provided education (often intertwined with entertainment) as examples or allegories. They gave pleasure and aroused feelings which, in some cases such as tragedy (if one follows the interpretation of *katharsis* as purgation) may have been considered therapeutic. Myths were also employed, especially in rhetoric, to explain the present in terms of the past, and to justify political or military decisions.

Greek mythology probably originated from the primitive forms of worship which existed in ancient Crete from about 3000 BC, and which were associated with animistic and magical beliefs. Over time such beliefs evolved into a body of legends involving natural objects, animals, and the anthropomorphic gods, and some of these legends found their way into the corpus of Greek myth. It may be observed that many of the principal Greek myths are connected with centres of Minoan and Mycenaean civilization. The legends of Perseus and Atreus are associated with Mycenae itself, while that of Oedipus is associated with Thebes, and that of Heracles with Thebes and Tiryns. It is therefore possible that these myths existed in some form in Mycenaean times.

Clay tablets from the time of the Mycenaean civilization (which reached its peak between 1400 BC and 1200 BC) provide earliest records of Greek mythology, and suggest that some of the main Greek gods and goddesses were known in the late Bronze Age. According to them, Poseidon was the principal god of the Mycenaeans, while Zeus held a less important place. The presence of the formulae "mother of the gods" and "Drimius, son of Zeus" suggests a divine genealogy. During the so-called Dark Age this mythology combined with that of the Dorians to form the mythology of Classical Greece.

The variety of factors that contributed to the formation of Greek myths and mythological personages resulted in the lack of unity, consistency, or coherence that pervades Greek mythology. The immense diversity stems partly from geographical considerations, since in widely differing regions there evolved different conceptions of the gods of the Greek world and varying rituals of propitiation. Moreover, the myths are often found in fragmentary form and in sources ranging in date from the 2nd millennium BC to the beginning of the Christian era, and it is important to realize that the older sources do not necessarily preserve earlier or more authentic traditions. In many cases the myths and fragments belong to large mythological cycles current in various communities and often not known to us in their entirety. Moreover, the myths contain elements originating in a varied historical and cultural background. In particular, the Mediterranean peoples, who worshipped an earth goddess, were conquered by successive waves of Hellenes bringing with them some form of tribal sky god. Thus, while gods like Zeus represent mainly the Indo-European cultural element, Demeter, Aphrodite, and Rhea probably represent Minoan-Mycenaean and Near Eastern elements. In fact, many deities, such as Demeter, Athene, and Zeus himself, combined in a single divinity both Mediterranean and Hellenic traits. Moreover, the myths have been subject to interpretation by poets and philosophers who have utilized many strands and varied traditions of the mythological cycles. The diversity of local legends may serve to explain the frequent sexual alliances of gods and heroes with their close relations, an idea repugnant to Greek custom. This may be the result of blending together of different legends representing a god and goddess (such as Zeus and Hera) either as husband and wife, or as brother and sister.

Greek myths are nevertheless relatively free of cloudy, grotesque, and horrible details such as are found in the legends of many other nations. Even their monsters are not particularly ugly or uncouth; nor is there much that is dreadful in their witches, ghosts, and demons.

Present knowledge of Greek myths rests principally on ancient Greek literature. The earliest surviving literary sources are the poems of Homer and Hesiod. The *Iliad* and the *Odyssey* focus on events surrounding the Trojan War, but involve the activities of the gods and refer to earlier legends such as the Theban cycle, the voyage of the Argo, and the exploits of Heracles. Hesiod narrates the birth of the cosmos, the succession of divine rulers, the ages of human existence, the origin of mankind's sufferings, and the source of sacrificial practices. Other sources of myths are the Homeric hymns, fragments of the cyclic poets, lyric poets (especially Pindar), the tragedians and comedians, Hellenistic poets and scholars, and writers under the Roman empire such as Plutarch and Pausanias. To these must be added various representations in the visual arts, among which temple friezes and vase paintings are of special importance.

Greek religion was not based on revelation and, with few exceptions (mostly associated with mysteries) did not involve spiritual teaching; and, although state officials in charge of religious matters are not unknown, there were no formal structures and no written codes embodied in a sacred book. There was, therefore, a great variety of beliefs and practices, and a resulting multitude of variations in the myths. The Greek myths embrace most of the themes commonly found in the mythologies of the world such as creation and origins (aetiological myths), birth of gods and other divine beings, death and the afterlife (eschatological myths), and the renewal and rebirth of the world.

Greek myths show certain characteristic features. They embody an anthropomorphic and non-fantastic view of the gods: the gods are depicted in human form and have human feelings. Strange and scandalous details, which have survived in locally established traditions, are usually suppressed in Homer and other archaic poets. The gods lived on Mount Olympus in Thessaly, in a society that ranked them in terms of authority and powers. They moved freely, however, and individual gods came to be associated with the three principal domains – the sky, the sea, and the underworld – while the earth was held in common. They were immortal, and controlled all aspects of nature. Human lives were totally dependent on their goodwill. Relations between men and gods were generally friendly; but the gods severely punished mortals whose behaviour was unacceptable to them. Excessive arrogance, ambition, or even extreme prosperity provoked divine wrath and punishment. Consequently, there emerged the idea of a dual motivation according to which human destiny came to be viewed as the outcome of joint action by men and gods. Hence the *Odyssey* attributes the destruction of both Odysseus' crew and Penelope's suitors to their own folly and the action of divine justice. Similarly, the Sophoclean Oedipus, while attributing his blinding to Apollo, nevertheless says that it was his own hand that did it (*Oedipus Tyrranus*, 1329–31]. Since the Greek gods were largely personifications of natural phenomena, Greek mythology emphasized human weakness in facing the awesome powers of nature.

Most, if not all, heroes of Greek legends were mortal. They were subject to birth, old age, and death. Nevertheless, they associated with the gods, and many of them claimed their descent from the gods. The majority of Greek heroes and heroines belong to one of two principal groups, namely, those who lived before the Trojan War (such as Jason, Theseus, and Oedipus) and those who fought in that war (such as Hector, Achilles, and Odysseus). Some of the heroic tales, such as those of Helen and Achilles, appear to go back to Indo-European times, while others, such as that of the cattle-raiding Heracles, may go back even further. Another distinctive feature of Greek mythology is the prominence of initiatory myths. It has been pointed out that early accounts of pan-Hellenic expeditions contain many elements of male initiation, while legends of heroines reflect the final transition into womanhood.

As scholars such as Peter Walcot (1966) and Martin West (1971) have demonstrated, Greek mythology is also heavily indebted to the rich mythologies of Anatolia and Mesopotamia, probably through contacts during the Early Iron Age. In his *Theogony* Hesiod has incorporated some violent myths of Hurrian origin concerning, among other things, the cannibalism of the gods which, at a later date, evinced the protests of Pindar: "It is not for me to call one of the blessed gods a cannibal: this I avoid." The castration of Uranus by his son Cronus derives ultimately from the Hurrians through Hittite and Phoenician intermediaries; the division of the universe by lot between Zeus, Poseidon, and Hades (*Iliad*, 15. 187–93) derives from the Akkadian epic *Atrahasis*; and the

figures of Oceanus and Tethys (*Iliad*, 14. 201) derive from Apsu and Tiamat in the Babylonian creation epic *Enuma Elish*. The last great wave of mythological invention was the result of Greek colonization of the Mediterranean and the Black Sea during the 8th and 7th centuries BC. Not only the *nostoi* but also the much older voyage of the Argonauts enabled newly founded colonies to relate themselves to the pan-Hellenic past as reflected in these myths and legends. Dynasties and heroic feats were among the more favoured themes of Archaic legend; but with the evolution of a more organized society, family relations received greater attention. Stress within the family leads to lies, betrayal, counter-seduction, and other forms of inhuman revenge – situations which Aristotle advised the poet to seize upon – but occasionally the family acts together to repel stresses from outside. The implicit drama of family stress is not confined to semi-realistic legends such as those of the houses of Labdacus and Atreus, but is also exemplified in the myths of the gods. Moreover, Athenian tragedy, in particular, concentrated more on the role of the individual in relation to the city-state and the value of democratic institutions. A large number of the stories belong to the category of aetiological myths, i.e. they originated as explanations of the birth or function of natural phenomena or religious rituals. In the latter case, it often happens that the myth survives in a detached form even after the ritual has disappeared. Many such myths are recorded by Pausanias (2nd century AD). Closely related are the myths of metamorphoses which, though found as early as Homer (e.g. Niobe and Proteus), came into their own in the Hellenistic age. The Hellenistic versions are aetiological in that they explain a present creature or landmark, though they lack the moral symbolism and the correspondence of animal and human traits characteristic of Ovid's narrative.

The commonest themes of Greek myth emphasize such preoccupations as contests and quests, particularly involving monsters; the relations between men and gods, whether of love, protection, or oppression; and the already mentioned stresses within the family, leading to acts of vengeance and displacement. Other themes emphasize fertility (though it did not find in Greece many different forms of mythical, as distinct from ritual, expression) and the displacement of elders. Eschatological myths include narratives of the imaginary world of the dead: how gods or defunct mortals pass beneath the earth, what they see on their way, the geography of the underworld and the aspect of its rulers and their subjects, the sufferings caused to the dead by neglect of their funerary rituals on earth, and so on. The developed and detailed eschatology is reflected not only in Near Eastern-type stories of disappearing gods, but also in the theme of heroic *katabasis*, or descent into Hades, e.g. that experienced by Heracles, Theseus, Orpheus, and Odysseus. The so-called Orphic tablets of the late 4th century BC instruct the dead about the topography of Hades, the springs of remembering and forgetting, and what the soul must say to prove its purity. Similar Orphic beliefs are also attested by Plato. Herodotus, probably rightly, traces such eschatological myths and rites to Egypt, but Mesopotamian influence cannot be ruled out (cf. G.S. Kirk, 1970, pp. 260–61).

Although the collection and interpretation of myths as a serious discipline did not begin until the latter part of the 18th century, ancient Greeks were not without thinkers and writers who reflected critically on their myths and expounded them. The first Greek physicist, Thales of Miletus (6th century BC), is represented as adopting a critical attitude towards the myths. By maintaining that the earth floats on water and that things come from water and go back to water, he attempted to correct, with the help of foreign myths known to him, what he saw as defects in the mythical cosmology of the Greeks. Criticism of the myths thus constituted a search for a rational understanding and control of the world. Myths lend themselves to change and adaptation to altered historical circumstances, and in ancient Greece this process continued down to the time when the claims of truth had to satisfy the new requirements of an emerging rationalism. Xenophanes attacked the anthropomorphic depiction of the gods in the myths, and this attack took on a moral dimension with him as well as with Pindar, Euripides, and Plato, on the grounds that the gods were depicted as immoral, adulterous, vengeful, and generally inferior to human beings. Allegorical interpretations (both physical and moral/psychological) were basically reactions to these attacks.

Herodotus (2. 53) believed that many Greek rituals were inherited from the Egyptians, and that the systematization of the Greek pantheon was due to Homer and Hesiod, who gave the deities their titles and distinguished their several provinces and special powers. Before that, the Pelasgians, on all occasions of sacrifice, called upon "the gods", but gave neither title nor name to any of them. Thus, according to Herodotus, and in the words of J. Harrison the mythology (or theology) of the Greeks "was not in the main the simple outcome of popular faith; still less was it a compilation due to a priesthood; it was the work of the poets". Prodicus of Ceos taught that the gods were personifications of natural phenomena. Plato employed myths and mythical modes to provide an insight into the deeper truths of philosophy not accessible to dialectical reasoning (cf. especially the *Symposium*). Although Aristotle is known to have been critical of the myths as fanciful and failing to embody truth about human life and the world, he realized their value in producing the tragic effect and, in his *Poetics*, advised would-be poets to keep as far as possible to the traditional stories. In the 4th century BC the mythographer Euhemerus in his *Sacred History* gave expression to the widely accepted belief of his time that myths were nothing other than distorted history, and that the gods were in effect kings and heroes who had been glorified over time and were worshipped for their deeds. Thus Zeus was an ancient king of Crete who rebelled against his father Cronus, the former king, and overthrew him. Biographies of other gods were similarly provided. Against this it has been argued that, to make a dead man into a god, one must already believe in some sort of gods, so that this theory cannot serve as an explanation of the origin of either religion or mythology.

During the Hellenistic period Greek beliefs were gradually modified under the influence of new philosophies (such as Stoicism) and the influence of neighbouring civilizations, but the myths recorded and adapted by Callimachus and his contemporaries were not directed at the general public (as were those of the Classical Greek poets), but at a small circle of connoisseurs. The Hellenistic and early imperial period saw a number of collections of myths compiled by scholars in order to elucidate allusions in the Classical authors. Most significant

in this respect was the collection of mythological scholia on Homer which circulated as a separate book at least during the first five centuries of the Christian era. There were also collections which concentrated on a single theme, such as the book of star myths compiled by Eratosthenes, and the famous *Bibliotheca* ascribed to Apollodorus which organized the myths according to families. It is chiefly to collections such as these that we owe our knowledge of the lesser-known Greek myths. With the coming of Christianity, the gods of antiquity came to be interpreted either euhemeristically or as inferior demons, while the myths themselves came to be rejected as untrue or were interpreted allegorically as moral or exemplary stories – an approach which persisted until the Renaissance. A striking example is the 3rd-century fresco from the Catacombs of Domitilla in which the risen Christ is represented as Orpheus returned from Hades. Appropriated thus by Rome, both pagan and Christian, Greek mythology has been repeatedly represented through the ages in the literature, painting, sculpture, drama, dance, and music of the west; and its impact on certain other cultures (e.g. Hindu and Buddhist legends) has now been established, even though the theory of Greece borrowing from India still has its adherents also.

The study of Greek myths in the modern age began in France during the 18th century, but soon shifted to Germany and England. The 19th century was dominated by the work of Heyne, who emphasized the historical, natural, and national aspects of myth. Friedrich Creuzer (1771–1858) was the principal modern exponent of the symbolic interpretation, and his best-known opponent was C.A. Lobeck (1781–1860), author of the *Aglaophamus* (1829), who emphasized the need to examine carefully the source of a tale and determine its date. K.O. Muller's main interest was the determination of the provenance of the myths. The most prominent in their application of the comparative method to the study of mythology were the German J.W.E. Mannhardt (1831–80) and the Briton Andrew Lang. The oriental philologist F. Max Muller revived the doctrine that mythology sprang from imaginative treatment of physical forces, while the school of psychological thought associated chiefly with the names of Sigmund Freud and Karl Jung has devoted considerable attention to myths and tried to explain their genesis. In the 20th century the classical attitude to myth has been dominated by the trends initiated by J.G. Frazer. The new knowledge of comparative anthropology was applied to the study of myth and religion by Jane Harrison, A.B. Cook, Gilbert Murray, and F.M. Cornford. The driving force behind their work is the idea that the motives of custom and myth in primitive societies can illuminate those of more developed cultures, including that of the ancient Greeks. They therefore used the findings of comparative social anthropology to elucidate enigmatic practices of ancient Greek religion. The centre of the group was Jane Harrison, author of *Prolegomena to the Study of Greek Religion* (Cambridge, 1903) and *Themis* (Cambridge, 1912), who had studied the works of Darwin, Freud, Marx, and Nietzsche. Other influences included Durkheim, Levy-Bruhl, and Bergson. Under these influences they furthered the concept of collective beliefs and emotions, inspired by E.B. Tylor's idea of a special kind of "primitive mentality", an idea which has since been drastically revised by Lévi-Strauss in his *La Pensée sauvage* (Paris, 1962). Comparatively little has been achieved since then, apart from following their views or moving away from them. This is true of M.P. Nilsson, H.J. Rose, Karl Kerenyi and Mircea Eliade, Robert Graves, G.S. Kirk, R. Farnell, L. Deubner, and most recently W. Burkert. However, their attention has been drawn more to cults, festivals, and other aspects of Greek religion than to myths proper, whose study they have nevertheless influenced, and recent work has concentrated mainly on the relationship between myth and ritual and the explanatory and normative functions of myth. Meanwhile, widely differing views on the speculative function of myths have been expressed by Bronislaw Malinowski on the one hand and Claude Lévi-Strauss on the other. The recent interest of Classicists in gender studies has resulted in the production of several works on women in Greek mythology, and the need to study Greek heroines independently, rather than as mere counterparts to the heroes, has been duly emphasized.

N

Nationalism

As a protean and resilient phenomenon, nationalism has stimulated scholars to attempt to trace its rudimentary manifestations far back in history: from the ancient Greeks' ethnocentric sentiment of cultural identification and arrogance towards the non-Greek world, to medieval movements of cultural separatism, usually linked to the emergence and consolidation of states. Nationalism both as a movement and an ideology, however, is principally a phenomenon of modern history, of explosive force and magnetism, whose energy has remained unabated over the last two centuries to the present day.

In the late 18th century and the two first decades of the 19th, and springing from the ramifications of the European Enlightenment and the cataclysmic impact of the French Revolution, Greek nationalism introduced a vanguard approach of social collectivity and attachment against the traditional background of the Ottoman-ruled lands. Imbued by liberal and secular European tenets, Greek intellectuals within and outside the Ottoman empire produced a matrix of a new Balkan ethnography which moulded and politicized Greeks' hitherto unformed sense of ethnic belonging, particularly among the Orthodox Greek-speaking subjects of the empire. They questioned the homogeneity of the enslaved and religiously self-identified society of the Balkans, articulated in the system of the *millets* (religious communities) and underpinned by the ecumenical values of the Orthodox Church, and they sought to reintegrate that society into fresh collectivities on the basis of distinction and differentiation, notably of language and the memory of their own perceived past. The Greek War of Independence (1821–27), leading eventually to a truncated Greek kingdom, was the successful outcome of this ideological ferment of the so-called Greek Enlightenment (1750–1821), which, out of an inextricable blend of nationalism and liberalism, cultivated and rallied collective beliefs around the idea of a nationally defined political entity: the nation state.

Once independence was attained, it was clear that within the confines of the newly established kingdom the Greek nation was lacking the cohesion, uniformity, loyalty, and enthusiasm with which the Greek intelligentsia had endowed it in the prerevolutionary stage. National allegiance and identity were objectives still to be pursued, rather than intrinsic, let alone primordial, attributes of the free nation. They were in serious competition with local attachments, social cleavages, and sectional political interests, already at work from the time of the struggle for independence. Even the Greek language, conceived of as an integrating factor, was in practice a pluralism of idioms to the point of confusion, aside from the fact that the nation embraced non-Graecophone groups which had actively participated in the Greek cause. Thus, in consolidating the national community, the Greek state was to play a decisive role; in this, it was largely in line with the major process unfolding in modern European history, in which nation states were indoctrinating their peoples with national and nationalist culture. Through national institutions, namely the army, the administration, the judiciary, and education, not only did the state extend and secure control over society, but it also imbued its citizens with national and nationalist values. To this process of statecraft-building with ideological implications subscribed the uncanonical proclamation in 1833 of the autocephalous status of the Greek Church and its independence from the ecumenical patriarchate, initiated by the Bavarian regency. Disregarding the Orthodox Church's deep-seated traditions, Greek nationalism made that highly influential and supranational authority comply with national prerequisites and, in time, develop as a component part of nationalist policies.

The early years of the Bavarian administration witnessed a readjustment of Greek nationalism in the formation of the political ideology of the new state. Stripped of its liberal and democratic origins, nationalism maintained its secular tradition and predilection for ancient Greece to sponsor the vision of a classicist state entertained by the new ruling elite. Classicism, as an ideological facade of the prospect of Europeanization, introduced an externally directed national ideology which, in its attempt to define Greek culture as "European" in the eyes of Europe, reproduced in cultural terms the subjugation of a rural, traditionally minded population to a governing elite. The gradual subsidence of the political legacy of the Greek Enlightenment, recorded *inter alia* in the revival of Orthodoxy as a backlash to the state-directed secular crackdown, reflected the response of the traditional culture and society to unfamiliar postulates claiming national originality. To mend this antithesis there would be an attempt in the course of time to mitigate Neoclassicism in favour of forms linked more deeply to Greek culture in the light of an organic concept of society.

This was put forward with the formulation of the so-called

Great Idea in its national sense -- an overarching nationalist vision which became the Greek symbol of collective identity and destiny. Initiated in 1844 by John Kolettis in a speech in the National Assembly, the new doctrine visualized the unity of Hellenism far beyond the bounds of the Greek kingdom to comprise all the Greeks living under Ottoman administration, with the addition of the Greeks of the Ionian islands. By integrating state territorial ambitions with religious impulse and folk mythology, the doctrine of the Great Idea cemented the national identity and would enthral the nation to the point of furnishing its raison d' être for nearly the next 80 years. At home, the new doctrine acted as an exemplary diversion of social dissatisfaction, and strengthened national unity, which, from the very inception of the independent kingdom's life, had been undermined by significant centrifugal forces. It is symptomatic of its homogenizing intent that the Great Idea was inaugurated in the midst of a national rift generated at the time by the heated debate, crossing the confines of the National Assembly into everyday politics, over the eligibility of the heterochthonous Greeks to enjoy an equal status with their autochthonous fellow citizens in the Greek state. As to foreign policy, it set territorial enlargement as a national exigency, and related any course of external policy to the extent to which it would realize its maximalist goals; for the Great Idea, however ambiguous in representing a precise foreign-policy programme itself, was broadly construed as a restoration of the Byzantine empire with Constantinople resurrected as the Greek capital.

Greek nationalism found in the person of Jakob Philipp Fallmerayer, a German historian, both a virulent critic and an unintended source of vigour and dynamism. By denying modern Greeks their direct natural connection with their ancient ancestors, Fallmerayer launched by reaction in Greece a prolific literature aimed at elaborating and solidifying the injured Greek national identity. The result was that out of that national trauma, Greek nationalism re-emerged fully fledged, gaining momentum, flexibility, and self-confidence. Rectifying the selective and vulnerable dogma of the Greek Enlightenment, which had opted for Classical Greece alone as the field of reference of the Greek national consciousness, Greek nationalism, thanks to the historical works of Konstantinos Paparrigopoulos, a history professor at Athens university, aptly incorporated the repudiated medieval Byzantine past in the national ideology. His five-volume *History of the Greek Nation* (published between 1864 and 1875) furnished the printed embodiment of the new national self-perception. In this way Hellenism transmuted itself into a cultural entity which assumed a more convincingly uninterrupted continuum from Homeric times to the present. Furthermore, in quest for authoritative evidence for this reconstructed concept of national history, a nationalist-orientated academic discipline – folklore – attracted keen scholarly preoccupation with a typically Romantic approach.

Of all the attributes of the now culturally based Greek nationalism, its inviting nature was the most instrumental factor in advancing foreign-policy aspirations. Embracing the unredeemed Greeks in one united nation state implied the integration of all the Greek-inhabited territories, which ethnologically presented an uneven and, in some regions, hopeless ground for straightforward territorial reshufflings. After the nationally compact Ionian islands were incorporated into Greece (1864), the rest of the targeted territories, particularly those of the more northerly Balkan heartland and the vast provinces of Asia Minor, were inhabited by peoples not only of various ethnic origin, but usually of floating and unshaped ethnic feelings. These could roughly be described as a rural and linguistically assorted majority, mostly Orthodox in the Balkans and Muslim in Asia, although religious confessions were much intermingled as well, with large numbers of Orthodox Christians and Muslims living on either side, not to mention the Jews. Consequently, winning over all these populations to the Greek national idea was a challenge to Greek nationalism, which in its fresh and inviting cultural guise allowed the equal accession of the Albanian-speaking, the Vlach-speaking, or the Turkish-speaking Orthodox with that of the Greek-speaking, provided they could learn to recognize themselves as members of the envisaged national community, regardless of ethnic origin. In cultivating Greek national identification among these groups, the hegemonic rank of Greek culture and education in the Balkans gave Greek nationalism a valuable advantage over rival nationalist sentiments propagated in the relevant lands from the other Balkan national states. Through an expanded and expansive cultural network of primary schools and societies run by local communities and sponsored in the areas by Greek consular authorities, Greek nationalism sought to incorporate local populations psychologically and thus to strengthen its claim to the coveted territories they inhabited. Against the background of European imperialism in the Balkans, the collision of the Greek Great Idea with the contending ones of the other Balkan states over the ethnological mosaic of geographical Macedonia accounts for the emergence of the turbulent Macedonian question from the last third of the 19th century onwards. At the same time, the discreet antagonism between the Greek state and the patriarchate in Constantinople for influence over the Ottoman Greeks gradually died down in favour of Athens, which assumed the role of the undisputed "national centre" for the destinies of the unredeemed brethren. Early on, this claim had been postulated symbolically on the accession of George I to the throne as "king of the Hellenes" (1863) in contrast to the mere "king of Greece" with which his predecessor Otho assumed the Greek crown.

In parallel to its territorial dimension as a unifying vision, the Great Idea embodied the orientations of sociopolitical camps at home over the evolution of Greek society. More specifically, the translation of the Great Idea into politics gave rise to two divergent paradigms personified at this stage in the conflict between Trikoupis and Deliyannis, or Venizelos and his rivals in the 1910s–20s. The first view stood for the construction of an efficient and responsible infrastructure of a modern state as a precondition of pursuing the enlargement of the Greek boundaries. The second one, by contrast, gave the top priority to the territorial issue and the special role Greece could play, not so much within the western European framework, as in the Balkans and the east. In other words, the treatment of the Great Idea as national ideology related to the options before the question of modernization and Europeanization of the country.

The debacle of the 1897 Graeco-Turkish War came as a bitter affront to the assertions and aspirations of Greek nationalism. Launched in a climate of popular furore and conspicu-

ous military unpreparedness, the war, the first involving the national army since the independent state was founded, brought the Greeks down to earth, confronting them with the discrepancy between the inflated national dreams and their actual potential. Nationalist intellectuals, however, by hurling every obloquy at the state, were anxious to qualify the demoralizing effect of the defeat so as not to taint the Great Idea as the ideology of national integration. What was defeated, they contended, was the state as an administrative mechanism, not the nation as a collective spiritual and indestructible unity destined to achieve distinction in history.

To this intellectual and psychological milieu belonged the eastern Greek vision of the scholar and diplomat Ion Dragoumis, arguably the foremost nationalist theoretician of his time. Out of an ambiguous blend of notions deriving from nationalism, socialism, and orientalism, Dragoumis propounded the idea that Hellenism was bound to thrive and rule over any other cultural and ethnic element in the Ottoman empire, provided it opted for the east as its privileged geocultural space. In place of the Greek state's aspirations for prompt enlargement and territorial conquest, Dragoumis reposed his firm belief in the assimilating potential of Hellenism, to which he attributed elemental cultural impact, to decide what he saw as an intrinsic and long-running process.

Such elaborations of Greek nationalism induced a rupture between the nation and the state, which, from the time the national state was achieved, had been perceived as aiming to be united. Only with the political ascendancy of Eleftherios Venizelos at the head of the Greek state, and the realization of the enlargement of Greece in the Balkan Wars (1912–13), did the ideological antithesis subside and the two entities become reconciled anew. Yet, at the apogee of Greek ambitions, with the Greek army marching into Asia Minor evoking the prospect of realizing the summit of nationalist yearnings, the Great Idea came to its shattering end in the wake of the Asia Minor disaster of 1922.

From the interwar period onwards, Greek nationalism shed its irredentist dimension, adhering to the state borders acknowledged by the Treaty of Lausanne (1923). Moreover, the eclipse of the Great Idea, from being the hegemonic culture of Greek society for nearly the whole of its independence period, induced an intellectual and cultural ferment in the light of the profound socio-economic crisis and political fluidity of the time. This gave rise to competing ideological trends revolving around the theme of national identity and nationalism. In a climate of reorientation and introspection, the discourse of the time sought to redefine the national identity and pin down "Greekness" in a way compatible with a sense of national sufficiency. Politics became interwoven with divergent nationalist approaches in the attempt of contending social forces to express themselves within a floating national framework. More specifically, it was at this stage that trends ranging from disciplinary nationalism and monarchic populism to lower-middle-class radicalism and Greek agrarianism elbowed one another in the wake of the retreat of the People's Party's (conservative) influence after the 1922 defeat. This ideological fragmentation, however, correlated to the stalemate of the modernizing endeavour of Greek society through republican forms, and led to the authoritarian and quasi-fascist nationalism of the late 1930s.

From the late interwar period onwards nationalism became manifestly associated with the right. This ideological appropriation deprived it of much of its hitherto unifying role as a cross-party point of reference and entangled it crudely in party politics and political conflicts. General Ioannis Metaxas, always obsessed with the idea of the organic state and of the disciplined undifferentiated society, had early pronounced in favour of self-sufficiency, including the territorial question, as a precondition of the creation of a "new Hellenic civilization". Once in office by virtue of usurped power, his "Regime of 4 August 1936" expounded the notion of the "Third Hellenic Civilization", an attempt to meld the ancient Greek and Byzantine cultures into a third quasi-fascist form deriving from imitation of contemporaneous fascist models.

In the 1940s, and throughout the anomalous constitutional period following the Greek civil war (1945–49), nationalism assumed a further populist complexion to operate in the terms of the "national schism" between nationalists and communists. It provided an ideological arm of the right against the rising popularity of the left-wing movement, with a view to compromising its opponents by hijacking the national sentiment for its exclusive use. Lastly, the 1967 colonels' junta attempted ephemerally, next in succession after the Metaxas dictatorship, but in a more ungainly manner, to produce a new grandiloquent version of Greek nationalism, now labelled "Helleno-Christian Civilization" – a term dating back to Greek Romanticism, coined in 1850 by the historian Spyridon Zampelios. As an ill-digested mixture of nationalist postulates and slogans, however, it only added to nationalism's discredit among the people, who perceived it as an abuse of sound patriotism. The dictators' abortive effort to enforce the union of Cyprus with Greece, leading ultimately to the Turkish occupation of the northern part of the island (1974) – the last area of substantial Greek population in the region remaining outside the borders of the Greek state and the last unredeemed land still pending in the minds of the Greeks after World War II – drove the last nail into the coffin of nationalism in its territorial aspect in contemporary Greece.

Whatever the ideological and political cleavages, Greek nationalism in the post-1922 state demonstrated a remarkably effective and, in retrospect, homogenizing role in the ethnological field. As an example of cultural and intellectual socialization it coalesced with state policies orientated to national compactness as a safeguard to territorial integrity. The massive influx of some 1.5 million refugees from Asia Minor, along with the parallel exodus of the Muslims (excluding western Thrace) as provided by the Population Exchange Convention of Lausanne (1923), cemented national homogeneity not only in overall numbers, but also specifically in regional ratios, for the bulk of the incoming refugees were channelled for settlement to Macedonia and Thrace, with their own ethnological peculiarities; the process was further advanced by the departure of the secessionist-inclined Slav-Macedonian element with the end of the Greek civil war. These population developments, particularly in the light of the traditionally centralized administrative and educational state system transmitting the values of Greek nationalism, allowed Greece to emerge as an overwhelmingly homogeneous society (95.6 per cent Greek-speaking and 97.9 per cent Orthodox according to the 1951 census), a picture consolidated to a maximum in time. Allowance

should be made, however, for the unrecorded, mostly illegal, massive immigration from the Balkan and eastern European states in the 1990s, which today has added remarkable linguistic and ethnic diversity to contemporary Greece.

The disintegration of the former Yugoslavia (1991), engendering a variety of destabilizing effects in the Balkans, rekindled nationalist overtones in Greek political rhetoric as a side-effect of the nationalist-defined and, not infrequently, inflammatory discourse in and about southeastern Europe during the 1990s. Far from containing implicit territorial ambitions, arguably with the exception of marginal extremist groups, this was symptomatic of Greece's concern lest it should become unintentionally entangled in a broader Balkan crisis; in fact it spasmodically reflected insecurity for its own territorial integrity in the long run, especially in the light of Turkey's proclivity to aggrandizement. Once again, at any rate, nationalism was afforded the climate to reiterate its role at home for ideological manipulation and social cohesion.

Lastly, as a current sign of the tenacity and universality of nationalist stereotypes outside the country, it is perhaps worth remembering the vituperative criticism that appeared at times in the European press attributing rampant nationalism to Greece's Balkan policy. By disparaging the Greeks more or less as a racial medley, not only did it descend to a nationalist-defined controversy, which it allegedly repudiated, but, worse, it crystallized an anachronism in terms of Greek nationalism itself, in that it resuscitated the obsolete and long-abandoned racially based version of Greek nationalism.

NATO

Drawn up at the outset of the Cold War, the North Atlantic Treaty of 1949 brought into being the primary alliance of the Western states and united their determination "to preserve their security through mutual guarantees" (NATO, 1995, p. 17). Since 1949, the North Atlantic Treaty Organization (NATO) has provided the military and political structure which enables the goals of the alliance to be implemented. Greece acceded to the treaty and became a NATO member in February 1952.

Various considerations led Greece to join NATO. During the Civil War (1946–49), the official Greek government's primary concern had been to avoid defeat by the communist forces and other members of the left-wing resistance – an objective achieved in part by direct and extensive American military and economic backing. By 1952, NATO membership was perceived as the mechanism to consolidate and formalize these existing security links with the USA. Also instrumental was the "northern danger": Greece's perception of the security threat from neighbouring communist Albania, Yugoslavia, and Bulgaria, and its assumption that NATO membership would couple Greek defence to Western security priorities. The last factor was Greece's objective in maximizing political independence from the USA while simultaneously ensuring American security guarantees. Alliance membership appeared to offer not only protection against Balkan communism, but also "a door to a community of democratic European states and a partial emancipation from exclusive American control" (Veremis, 1988, p. 242). Despite earlier reservations on the part of Great Britain and the Scandinavian countries, by 1952 the existing NATO members considered Greek membership as essential because "as Cold War tensions heightened, Greece was increasingly viewed as a bulwark against communism" (ibid., p. 241). Within the alliance's containment strategy, inviting Greece and Turkey to join simultaneously also offered the prospect of formalized and extended pan-Mediterranean security arrangements to contain the Soviet fleet in the Black Sea.

Between 1952 and 1974 Greece was steadily integrated into NATO's military structure. In October 1953 agreements were concluded with the USA which authorized construction of military bases and supporting facilities in Greece. Expanded throughout the 1950s, these bases were essential instruments of containment vis-à-vis the Soviet Union (and its Balkan allies) and formed a credible NATO commitment to the defence of Greece. Against what was then perceived as the major threat to Greece – Warsaw Pact expansion – the facilities strengthened NATO's strategic capabilities in the area, guarded Aegean Sea approaches to the Mediterranean, and provided key surveillance facilities for monitoring Soviet forces in the eastern Mediterranean. During the military junta (1967–74), military cooperation was extended through the 1972 home-port agreement which allowed the stationing of US Navy carrier forces near Athens.

After 1974 Greece's political relations with NATO deteriorated. In domestic political terms the overthrow of the military junta in 1974 accentuated widespread public perceptions in Greece that the USA had openly and unequivocally supported the dictatorship. Moreover, NATO's inability to deter (or stop) the Turkish invasion of Cyprus throughout July and August of 1974 was interpreted as a tilt in favour of Turkey. The result was a cooling of relations with the USA but also a threat re-evaluation: Turkish, rather than Warsaw Pact, expansion was now considered the major threat to Greek sovereignty. These factors were instrumental in the Karamanlis government's decision to withdraw from the NATO military structure in August 1974.

Between 1974 and 1980, and outside the NATO military structure, the New Democracy administration's political relations with the alliance were constrained by two areas of dispute with Turkey. The first arose as Turkey contested, *inter alia*, Greek mineral rights in the Aegean and prerogatives in the Aegean Flight Information Region (FIR), and also Greece's long-standing policy of a 16-km airspace for its Aegean islands. The second stemmed from Turkish attempts to take advantage of Greece's withdrawal from NATO to promote Ankara's role and operational control in the alliance's southern region. Despite the fact that key disputes with Turkey remained unresolved, Greece began the process of reintegration into the NATO military command in October 1980.

After 1981, and the election of Papandreou's Panhellenic Socialist Movement (PASOK), the new administration's rhetoric emphasized the removal of American bases from Greek soil, non-alignment, and consolidation of the view that the major threat to Greece's security came from Turkey rather than the Soviet bloc. Despite the anti-NATO tone of his policy statements, however, and the internal strains on the alliance brought about by requests for NATO to extend a security guarantee for Greece's frontiers against Turkish aggression, "Papandreou's eight-year tenure brought no major shift in Greece's broader relations with NATO" (Papacosma, 1995, p. 252).

Since the end of the Cold War in 1989, Greece's military commitment to NATO has remained significant in terms of the allocation of its own land, maritime, and air assets. However, the demise of the Soviet Union and increased volatility in the Balkans have strained Greece's political relations with its NATO allies on important questions. During the Cold War, Greek and Turkish security interests were "accommodated within NATO, and where antagonisms flared, they were contained to the point of avoiding war" (RUSI, 1994, p. 60). Since 1989, however, increases in Greek and Turkish arms imports under NATO's "cascade" programme (whereby smaller alliance members qualify to receive free heavy

weaponry from allies) and volatility in the Aegean caused by Turkey's challenges to Greek territorial waters have heightened regional tensions. In addition, the revival of Greece's traditional friendship with Serbia and its positions on the Former Yugoslav Republic of Macedonia and the Turkish Kurds have brought Greece's policies "into direct opposition with western powers" (ibid.) leading to criticism from its NATO allies.

Since joining NATO, Greece's political relations with the alliance have been volatile. This has reflected Greek perceptions since 1974 that the primary threat is intra-alliance in the form of potential Turkish aggression, and more recently from Greece's historical and cultural links with states and groupings in the Balkan region. However, Greece's military relations with NATO have been cordial and reflect successive administrations's realpolitik calculations about the overriding benefits that the alliance can provide. These benefits – that Greece can counterbalance Turkish influence within the alliance on the Aegean and Cyprus questions, maintain access to American military aid, and benefit from the "cascade" programme – are the fundamental factors that bind Greece's defence and security interests to NATO membership.

Naucratis

City in Egypt

Naucratis, on the east bank of the Canopic branch of the Nile, 84 km southeast of Alexandria, was a Greek city in Egypt. It was the birthplace of Athenaeus, and Sappho's brother Charaxas visited the city on business.

Naucratis has been identified with the mounds of Kom Ga'if. Excavations of the site were first carried out in 1884–86 by W.M.F. Petrie and E.A. Gardner, followed by D.G. Hogarth in 1899 and 1903. Since 1977 an excavation and survey by an American team led by W.E. Coulson have been under way. Half the site was destroyed by local people in the 19th century and a lake now covers the area of the old excavations. Modern excavations thus focus on the outskirts of the site and its surrounding territory.

Although both Herodotus (2. 178–9) and Strabo (17. 1. 18) provide lengthy information on Naucratis, many questions relating to the city remain unanswered and subject to dispute. It was initially established as a trading settlement (*emporion*) in about 650 BC, during the reign of the pharaoh Psammetichus I (664–610 BC) and under pharaonic control. Under Amasis (570–526 BC) the Hellenion was built by Ionians from Chios, Teos, Phocaea, and Clazomenae, and by Dorians from Rhodes, Cnidus, Halicarnassus, Phaselis, and Aeolian Mytilene. Aegina, Samos, and Miletus had erected their own temples dedicated to Zeus, Hera, and Apollo (Herodotus, 2. 178–9).

The earliest Greek pottery at the site, about 21 known examples, dates from the last quarter of the 7th century BC and belongs to the transitional and early Corinthian period. There are substantial quantities of middle Corinthian and early Attic black-figure ware, dating from the end of the 7th/early 6th century BC onwards, which probably reflect the extensive scale of Greek activity in Naucratis from the end of the 7th century BC. Nearly all archaic pottery found there accords with information given by Herodotus on the joint establishment of Naucratis by a number of Greek cities: there are ceramics of Rhodian type; Chian and Samian pottery; *fikellura* of Rhodian, Samian, or Milesian production; Clazomenian, Spartan, Corinthian, and Athenian vases; and Aeolian (Lesbian) plain pale grey *bucchero*.

Architectural remains are in very bad condition. Dedicatory inscriptions and offerings to temples help to identify to which gods or goddesses temples were erected. The temple of Aphrodite, not mentioned by Herodotus, lies in the southern part of the town. Temples to Hera and Apollo stand next to one another, and a small shrine to the Dioscuri (again not mentioned by Herodotus) was excavated in the northern part of the site. In this area of the city a large sanctuary was discovered. Inscriptions on vases unearthed there mention several deities, sometimes just "the gods of the Greeks", and these dedications give grounds for identifying this sanctuary as the Hellenion mentioned by Herodotus, the joint foundation of several eastern Greek states. Archaeological material from these temples shows that these cults date back to the early days of the settlement, and the temples were rebuilt or replaced several times in different periods.

East of the temple of Aphrodite was a small factory that produced faience scarab seals. It was active mainly in the first half of the 6th century BC. There were also local workshops producing Greek-style pottery (identified by style and technique) for local use as votives. Faience scarabs and figure vases were well known throughout the Greek world. In the 6th and 5th centuries BC there are isolated instances of Greek-manufactured objects directed to specific sites in Egypt. Thus, the inhabitants of Naucratis, not a large settlement, supported themselves by trade and craft work. In the literature, Naucratis is often compared with such commercial outposts of the British empire as Hong Kong or Shanghai.

The exact status of Naucratis is disputed. According to Herodotus and some modern scholars, the settlement was divided into two parts: a polis, inhabited by permanent settlers,

and an *emporion* (trading settlement) peopled by Hellenion (visitors). It is possible that when Naucratis was under Persian rule in the 5th–4th centuries BC it was a polis. What little evidence exists (decrees and a tombstone with the ethnic of settlement as part of a personal name) is not very clear. By the Ptolemaic period, immediately after Alexander's conquest of Egypt, Naucratis did have the status of an autonomous polis. It had its own laws (including a ban on intermarriage), citizenship, and coinage. Graeco-Macedonian rulers recognized the site as a centre of Hellenic culture. With the Macedonian conquest the separate sanctuary area (the northern part of the settlement) lost its importance and was combined with the rest of the city (the southern part of the settlement). The settlement was reformed and adopted the Milesian calendar and laws.

In the Roman period Naucratis retained its Greek constitution; citizens had no right of intermarriage with Egyptians. It had a *boule* (council) and held annual public games. It remained a trade and craft centre throughout the Ptolemaic and Roman periods.

Summary

A Greek city in Egypt, Naucratis began as a trading station established *c.*650 BC. Archaeology confirms the statement of Herodotus that it was a joint foundation by a number of Greek cities. The inhabitants lived by trade and craft work. By the Ptolemaic period it was an autonomous polis with its own laws and coinage.

Naupactus

Port on the gulf of Corinth

Naupactus (modern Nafpaktos) is a strategically located port on the northern coast of the gulf of Corinth, just east of its narrowest part. Originally called Locris (Apollodorus, 2. 8. 2–3), it became known as Naupactus ("ship-construction" or "shipyards") after the Heraclid Temenus built a fleet there (see also Pausanias, 10. 38. 10; Polyaenus, *Stratagems*, 1. 9; Suda s.v. *Naupaktos*). According to Apollodorus, this fleet was later destroyed at Naupactus when one of the Heraclids, Hippotes, killed a prophet whom he mistook for a Peloponnesian. The killing of this prophet apparently angered the gods, who brought doom upon the Heraclid forces and their fleet.

Other myths or legends associated with Naupactus are not extensive. Aeschylus (*Suppliant Women*, 260–70) relates that Apollo's son Apis, a prophet and healer, came from Naupactus and rid the Argolid of monsters that threatened humans. One tradition also suggests that Ktimenos and Antiphos, Ganyktor's sons, murdered the poet Hesiod at Naupactus (Pausanias, 9. 31. 6; Plutarch, *De Sollertia Animalium*, 969e), and that Hesiod was buried there (Pausanias, 9. 38. 3). Numerous references exist to an epic poem called the *Naupaktia*, which according to Pausanias (2. 3. 9) described Jason's life on Corfu after his expulsion from Iolkos. The authorship of the poem was uncertain; though Pausanias (10. 38. 10) reports that by tradition the poem was usually attributed to a Milesian, he believed that the author was Carcinus of Naupactus.

The strategic importance of Naupactus emerges in the 5th century BC. In the early 450s BC the Athenians, under the command of Tolmides, captured Naupactus from the Ozolian Locrians, who had apparently colonized Naupactus during the first quarter of the 5th century BC. After capturing Naupactus (probably by the mid-450s BC), the Athenians colonized it with some Messenians, who had rebelled against the Spartans, were besieged by them on Mount Ithome, and eventually surrendered. The Spartans, however, at the behest of the Delphic oracle, allowed the Messenians to leave the Peloponnese, after which they were received by the Athenians, who colonized Naupactus with Messenians because of their mutual enmity towards the Spartans. Having an ally at Naupactus would allow the Athenians to put both military and economic pressure on the Spartans' ally, Corinth. With Athens' own port in the east and Naupactus in the west, the Athenians could dominate the Greek seas. (See Thucydides, 1. 103. 1–3, 2. 9. 4; Isocrates, 12. 94 (*Panathenaicus*); Diodorus, 11. 84.6–7, 12. 44.3, 12. 47. 1; Pausanias, 4. 24. 7, 31. 7, 10. 38. 10).

Messenian occupation of Naupactus continued for the next few decades, and when the Peloponnesian War broke out in 431 BC, Messenian hatred of the Spartans and their friendship with Athens allowed the Athenians to use Naupactus as a base of operations against the Spartans and their allies. With Naupactus at their disposal, the Athenian naval presence in the gulf of Corinth could counter the Spartans' allies Corinth to the east, as well as the Spartan-controlled port of Patras. Moreover, thanks to superior naval forces, the Athenians held sway in the gulf of Corinth during the Peloponnesian War. Phormio's victory over the Peloponnesians in 429 BC, despite being outnumbered in ships more than two to one, is still admired for its tactical brilliance (see Thucydides, 2. 69.1, 2. 83; Diodorus, 12. 47. 1–48. 1; Pausanias, 4. 26. 1; Polyaenus, *Stratagems*, 3. 4). By the century's end, though, the Spartans had crushed the Athenians, and between 403 BC and 397 BC they expelled the Messenians from Naupactus (see Xenophon, *Hellenica*, 3. 2. 21–3. 1; Diodorus, 14. 34. 2; Pausanias, 4. 26. 2; 10. 38. 10).

After the expulsion of the Messenians, Naupactus came under Locrian control. Between 395 BC and 389 BC the

Locrians were again supplanted by the Achaeans, who held Naupactus until 366 BC when Epaminondas drove them out. After this, Naupactus again became a Locrian possession. How long the Locrians retained Naupactus is not clear, but Demosthenes (9. 34) indicates that in 342 BC the Achaeans held the port and this continued until 338 BC when Philip II of Macedonia seized it and handed it over to the Aetolians.

Naupactus resurfaces in 217 BC as the site of a conference between Philip V of Macedonia and the Aetolians and Achaeans, a meeting that resulted in a peace accord between the two sides (Polybius, 5. 102–103). Livy reports that Roman commanders made use of the port in 211 BC and 208 BC, and that the Aetolians used it as a meeting place in 200 BC, 193 BC, and 191 BC. The Romans besieged Naupactus in 191 BC when the Aetolians revolted against the Roman cause. After two months, though, the siege was ended through negotiations (Livy, 36. 35), but the enmity between the Aetolians and Romans ultimately became irrelevant since Greece became a Roman province in 146 BC.

During the later Roman republic and empire, little mention of Naupactus exists other than the Caesarian Calvisius' expulsion of a Pompeian garrison there in 48 BC. In the 2nd century AD Pausanias (10. 38. 6–7) describes a few shrines and sanctuaries dedicated to Poseidon, Artemis, Aphrodite, and Asclepius, the last of which was in ruins in Pausanias' day and of which a few remains are extant.

After the division of the Roman empire in the 3rd century AD, the Byzantines controlled Naupactus. In 431 the bishop Callicrates represented Naupactus at the third Ecumenical Council at Ephesus. At the fourth Ecumenical Council (451) at Chalcedon the bishop Eirenaios represented Naupactus. In AD 551 Procopius (*On the Wars*, 8. 25. 17) reports that Naupactus and several other towns were levelled by an earthquake. Naupactus was rebuilt and in the mid-10th century it is listed in the theme of Hellas (Constantine VII Porphyrogenetos, *On the Themes*, 5. 12). After the sack of Constantinople in 1204 by the Venetians and the Crusaders, the Venetians claimed Naupactus. During the Venetian occupation the name Lepanto appears, although Naupactus remained in use. "Lepanto" appears to have evolved from "Nepantum", a corruption of "Naupactus", which seems to have been further corrupted to "Lepanto".

The Venetians controlled Naupactus until 1361, when it fell to the Catalans. By 1407, however, the Venetians recovered the city, but in 1499 lost it to Bayezid II and his Ottoman Turks. On 7 October 1571 Christian forces commanded by John of Austria crushed an Ottoman fleet, under Uluç Ali Pasha, in a conflict now known as the Battle of Lepanto, which was the first major Christian victory over an Ottoman navy that had previously been considered invincible. The Christian victory checked Ottoman efforts to control the Mediterranean. The Battle of Lepanto was the last major battle in which galleys were the primary naval vessel employed. It is also worth noting that the Spanish novelist Miguel de Cervantes lost the use of his left hand in this battle.

Though Christian forces were victorious at Lepanto, Naupactus remained an Ottoman possession until the Greeks finally cast off Turkish rule in 1830. Other than the German occupation of Greece during World War II, Naupactus has remained under Greek control. Today Naupactus has about 10,000 inhabitants, a pleasant beach, limited remains of Byzantine architecture, sculpture, and inscriptions, and a primarily Venetian castle whose ramparts embrace the town's harbour. Naupactus' importance, though, has greatly diminished since the 5th century BC, due to its relative isolation from the northern interior of Greece and its location in one of the least populated regions of Greece. From 1980 to 1986, for example, Naupactus was not listed by name among the principal ports of Greece (*Statistical Yearbook of Greece: 1988*, pp. 396, 399).

JOHN E. THORBURN

Summary

A port on the north shore of the gulf of Corinth, Naupactus was important during the Peloponnesian War. After 1204 it was in Venetian hands and was known as Lepanto. In 1571 it was the site of a major sea battle between Christians and Turks. Since then it has declined in importance.

Nauplia

City in the Peloponnese

Nauplia (modern Navplion, medieval Anapli or Napoli di Romania), an important and picturesque harbour town of about 12,000 people, is situated on the Argolic Gulf in the Argolid region of the northeast Peloponnese. It lies beside the sea at the base of two summits: Akronavplia (or the Its Kale), a relatively low but precipitous promontory of *c.*84m, and the Palamidi, a rocky peak of some 215m on which stands an imposing fortress. The town is now best known as a cultural

and tourist centre, but it has had a long and illustrious, if sometimes very troubled, history.

Tradition associates Nauplia both with the mythical Nauplius, son of Poseidon, and with Nauplius the Argonaut who avenged himself on the Greek participants in the Trojan War after they betrayed and killed his son, Palamedes. Settlement at the site may be traced as far back as the palaeolithic period, with remains from that date and from neolithic times found on Akronavplia. During the Bronze Age the main centre of habitation seems to have been the Pronoia area to the east of the old town; Mycenaean chamber tombs have also been found nearby. The settlement continued to exist in the Dark Age and a cemetery of the Geometric period has been excavated. Traces of occupation continue until the Hellenistic period, but evidence is rather limited. Indeed, historical accounts mention that Nauplia was destroyed by its neighbours, the Argives, during the reign of king Damocratidas (no later than *c.*600 BC), after which the town became the harbour of Argos (as it may have been in Mycenaean times). By the Roman period the site was deserted since Pausanias, who visited it in the 2nd century AD, reports only a sanctuary of Poseidon there; even the fortress walls were in ruins by his day.

The period of desertion evidently lasted for several centuries, but Akronavplia may have been refortified as early as the 3rd–4th century AD and, by the 6th century, Nauplia was once again a thriving and developing centre, becoming the seat of a bishop by 879 and of an archbishop by 1189. During the Komnenian revival in the 12th century, a number of churches were built in the area and the town, which probably occupied the western (seaward) end of the fortified promontory of Akronavplia at this time, with only the harbour below, became a fairly important commercial centre enjoying trade relations with the Venetians. As the central authority of the Byzantine empire waned in the later part of the century, Nauplia briefly came under the semi-independent control of the local Greek magnate Theodore Sgouros and subsequently of his son Leo, who also ruled Argos and Corinth. The Franks arrived in 1204, however, following the sack of Constantinople by the forces of the Fourth Crusade and, after determined resistance, the town eventually fell in 1210 to Geoffrey de Villehardouin, although the Greeks continued to hold out at the seaward end of the promontory of Akronavplia in one of the two fortresses which had been constructed there.

Following the fall of Argos in 1212, control of Nauplia was given over to the Burgundian de la Roche family which had established itself at Athens, and it remained, directly or nominally, in their hands for more than a hundred years. In the 14th century the town came into the possession of the Enghien family and thence passed, in 1389, to the Venetians, despite an attempt by Theodore I Palaiologos, the Byzantine despot of the Morea, to bring it back under Greek control from Mistra. Nauplia became one of the most important Venetian holdings in Greece and retained its prominence into the 16th century, but its viability was gradually undermined by the growing Turkish presence in the Peloponnese and, after a long and bloody siege, the town surrendered to them in 1540. Another period of prominence as the Turkish capital of the Morea was followed by a renewed decline in the 17th century until, in 1686, Nauplia was retaken by the Venetians. The town's fortunes revived once again, its population expanded, and, now the Venetian capital of the Morea, it was given the name 'Napoli di Romania'. It was at this time too that the Venetians, beginning with the general François Morosini, embarked on a campaign to strengthen the fortifications on both Akronavplia and the Palamidi (using designs provided by the French engineers LaSalle and Levasseur), as well as those on the island of the Bourtzi (Agioi Theodoroi) which guarded approaches to the harbour. In 1715, however, only a year after the work was completed, the Turks invaded again and, despite the magnificent fortifications, the inadequate garrison proved to be no match for the far superior Turkish force. After a siege of only eight days the Palamidi fell and the Venetians, who unsuccessfully attempted to take refuge in the fortress on Akronavplia, were either massacred or sold into slavery. This proved to be the end of Venetian control not only of Nauplia but of the whole Peloponnese.

The next phase in the town's history comes with the Greek War of Independence. In 1821 the Greeks besieged the Palamidi and, when it fell the following year, they finally recovered Nauplia from the Turks. This event did not bring immediate peace, however, for internal rivalries among the Greek leaders led to a struggle for control of the town. On 7 January 1828 Count Kapodistria moved his provisional capital to Nauplia, and it was there, in 1831, that he was assassinated; the bullet hole is still visible in the wall of the church of St Spiridon in the centre of the town. On 25 January 1833 Otho, the first king of Greece, arrived in Nauplia and, during that year and the next, the town enjoyed a brief but glorious phase as the capital of the country until it relinquished this role to Athens in September 1834. For the rest of the 19th and the early part of the 20th century Nauplia continued to be a prosperous provincial town and port, but memories of its troubled past were reawakened during the German invasion of Greece in April 1941 when it became one of three main sites in the Peloponnese used for the evacuation of Allied troops; the operation was a desperate one and some serious losses were incurred. Liberation did not come until the autumn of 1944.

Much of Nauplia's charming Neoclassical architecture dates to the period of revival in the first half of the 19th century, but there are many reminders of the Turkish occupation still evident in the town, most strikingly perhaps in the fountains and mosques, one of which (the Voulevtiko), at the southwest corner of the main square (Syntagma), was the site of the first Greek parliament between 1827 and 1834. Even more noticeable are the traces left by the long Venetian presence: in addition to the fortifications which still dominate Nauplia, a number of their churches and other buildings remain, including the former naval barracks which stand at the west end of the main square and now house the Archaeological Museum.

Today Nauplia has put its violent and troubled history behind it and prides itself as a cultural and artistic centre. Tourism, both international and Greek, has brought prosperity, but this has not been allowed to spoil its charm or its architectural heritage. A flourishing and beautiful town, Nauplia's older buildings, squares, and monuments have been carefully maintained and restored in recent years, while new development, including housing, some industry, and a sizeable army

base, has been controlled and largely confined to areas outside the old town.

A. FOLEY

Summary

Situated on the gulf of Argos, Nauplia was the port for Argos in antiquity but was deserted by the 2nd century AD. Flourishing again by the 6th century, it became the seat of a bishop by 879 and of an archbishop by 1189. Taken by the Franks in 1210, Nauplia passed to the Venetians in 1389. Turkish after 1540 (but Venetian again from 1686 to 1715), Nauplia played a prominent role in the War of Independence. In 1833–34 it was the first capital of Greece.

Navy

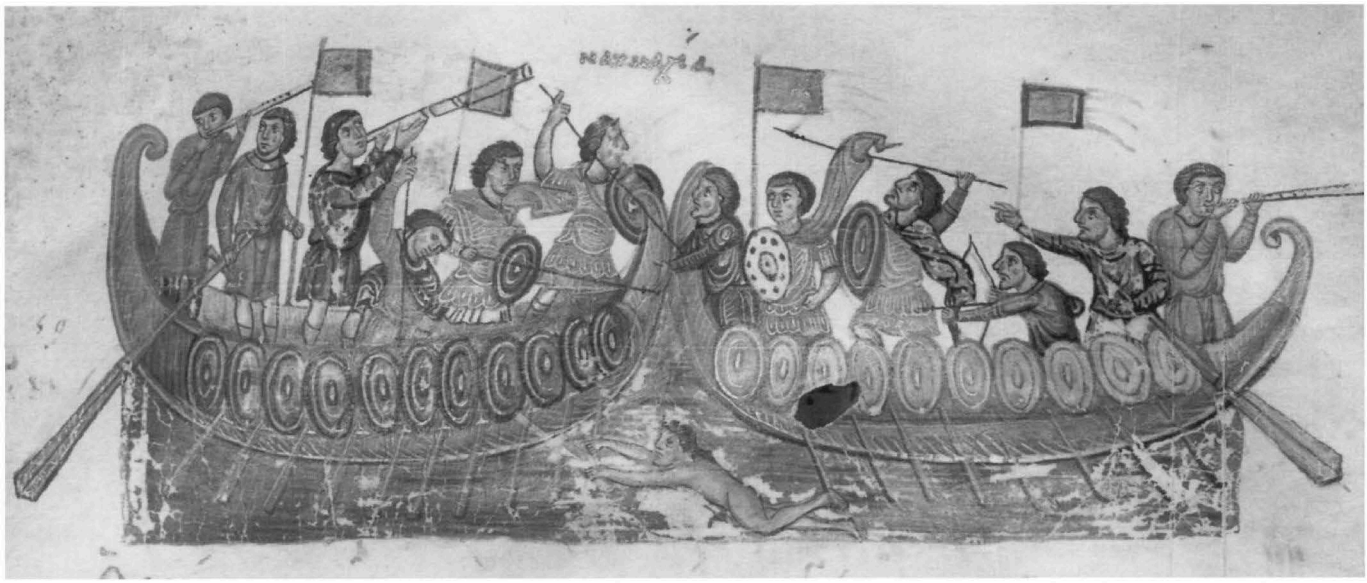
Greece has a mainland coastline of about 16,600 km together with over 4000 islands, islets, and rocks. It occupies an important geostrategic position in the eastern Mediterranean and merchant shipping has become a significant element of the national economy. Not surprisingly, Greece has a long naval history and maritime tradition, and it is to its naval fighting abilities "that Greece owes its existence – an existence whose character was formulated and strengthened by the sea" (Alexandris, 1987, p. 92).

The development and employment of maritime power was a vital characteristic of Greece's ancient history. In the 2nd millennium BC the Minoan empire in Crete emerged as the first organized naval power in the world. Later, during the 5th century BC, the success of Athens and the "golden age" of Pericles depended on the systematic development of sea power. Though the first Persian invasion of Greece by Darius in 490 BC was defeated by the Athenian army at Marathon, the Athenian politician Themistocles was quick to recognize that, in any future attack, land forces alone would not be enough in the face of the vast numerical superiority of the Persian army. Using new-found revenues from the state silver mines at Laurium, the Athenians decided to build a large fleet. The principal fighting element of the new fleet, and a significant Athenian technological innovation, was the trireme – the fastest warship of its time, which could ram and sink enemy ships without exposing itself to the risk of grappling and boarding its opponents.

Themistocles' rationale for developing a naval capability was subsequently vindicated. During 480 BC the Persians, under the generalship of Xerxes, attacked northern Greece with land forces and a fleet of over 500 ships. The invading army destroyed an outnumbered Spartan force at Thermopylae and then engaged in an indecisive naval battle with a Greek fleet off Artemisium. At the subsequent Battle of Salamis, the Persian and Greek fleets were evenly matched in numerical terms, but the edge provided, *inter alia*, by the triremes enabled the Greeks to win a decisive victory. The Battle of Salamis conclusively demonstrated the ability of Athens to wage war from the sea and it was an essential precursor to its wealth and dominion.

After the defeat of Athens by Sparta and its allies in 404 BC the role of seapower in Greece declined relative to the part played by land armies. Throughout the period of Macedonian rule, for example, despite major military victories and conquests, there were no remarkable naval feats. Because of his unfamiliarity with maritime affairs, Alexander the Great elected to develop a small navy and avoided engaging his enemies at sea. Instead, Alexander achieved sea control indirectly by attacking and capturing the naval forces of his enemies from land. Though Rhodes subsequently became an important maritime power and formulated the "Rhodian Sea Law", the oldest maritime code in the world, and though the Greeks struggled to control sea routes to the western Mediterranean against the sizeable navy of Ptolemy, in the Hellenistic and Roman periods the development and use of force at sea remained subservient to maintaining strength on land.

The Byzantine empire relied heavily on its navy at key moments to prevent foreign invasion. Byzantium's fleet played an important role in defeating attacks by the Arabs and during the Gothic wars. Other notable naval successes included the fleet's ability under the emperor Herakleios (610–41) to prevent the Persians, in alliance with the Avars, from attacking Constantinople, and beating off the Arab Muawiya's attempt to capture Constantinople in 674–78. The major naval victories of the Byzantines were dependent upon two factors: organization and technology that were superior to those of their adversaries. In organizational terms the fleet was arranged as part of the empire's system of themes during the 7th century. Functionally, it was divided into the imperial navy (*vassilikon ploimon*) of Constantinople, and the navy of the themes (*thematikon ploimon*), which covered the provinces of the empire, operating under a commander-in-chief of the navy. This structure was instrumental in defeating the empire's naval opponents. In technological terms the fleet also had a decisive edge. The principal battleships of the Byzantine fleet were "dromonds": boats with sails and two banks of oars crewed by up to 300 personnel. The combination of the ramming spur of the dromonds and the skill with which the Byzantines manoeuvred their vessels provided a formidable capability. However, the more significant technological factor, and a strictly guarded state secret, was "Greek fire". Invented by the Syrian Greek Kallinikos, Greek fire was an inextinguishable mixture of sulphur and other combustible materials that was hurled at enemy vessels either by catapult or rudimentary hand grenades, or was piped through a hose. This brilliant technical achievement of Byzantine naval science was a further precursor to maritime success.



Navy: illustration from an 11th-century manuscript of the *Cynegetica* of Pseudo-Oppian (3rd century AD) showing two warships about to meet in combat, Biblioteca Nazionale Marciana, Venice

It is important to note, however, that Byzantine naval policy was not without its limitations. The most serious was the tendency to neglect and underfund the fleet when there was no immediate naval threat to the empire. Notable here was the increasing weakness of the fleet after the invasion of the Seljuks in the 12th century, a weakness demonstrated by the fact that the empire was forced to enlist the help of the Venetians and grant major trade concessions in return. By this stage, Byzantium had made the fatal mistake of relying on the navy of Venice and thus lost its own control of the sea in the longer term.

Despite the absence of naval forces during the Tourkokratia, the years between 1453 and 1821 were important for Greek maritime development in a number of respects. The period of the Turkish occupation witnessed the emergence and growth of the Hellenic merchant marine, and an associated increase in seaborne trade. The environment in which Greek merchant shipping had to operate was hostile: merchantmen had to fight frequently against pirate vessels and the warships of the European powers that regularly blockaded the Mediterranean sea routes. A consequence was that Greek crews became trained in the art of sea warfare and acquired a knowledge of basic military organizational structures. This was to prove significant in the War of Independence after 1821 because Hellenic merchant shipping was easily converted into a rudimentary naval force which then harassed and skirmished with Turkish maritime assets.

The origins of the modern Greek navy can be traced to developments in the late 19th century. In 1884, at the request of the Greeks, a French Naval Training Mission was invited and the Naval Cadet School was established. During 1907 the General Naval Staff was created and, in 1909, a British Naval Training Mission was invited. By 1911, in response to the growth in Turkish naval capabilities, the Hellenic navy had acquired three battleships and the battlecruiser *G. Averoff*. The procurement of a submarine capability followed and during World War I the naval air force became an organic part of the Hellenic navy. Despite the occupation of Greece during World War II the navy continued operations from abroad in support of the Allied war effort. By 1953, following the adoption of the concept that a unified direction was required for the Greek armed forces, the Hellenic navy adopted what remains its present organizational structure.

Today the general staffs of the navy, army, and air force are directed by the Ministry of National Defence, through the National Defence General Staff. The Hellenic navy is headed by the Chief of the Hellenic Navy General Staff, who also acts as Commander Eastern Mediterranean (COMEDEAST) in the NATO command structure. It is organized under three major commands: Fleet Command (at Salamis), Naval Training Command (at Skaramanga), and Naval Logistic Command (at Athens). The operational concept of the Hellenic navy reflects "the combined requirements of national and NATO strategic concepts" (Drikos, 1992, p. 32). The major roles of the Hellenic navy are fourfold: to perform sea control missions in COMEDEAST's area; to protect the Greek coast and islands; to provide support to Greek and allied armed forces; and to safeguard Greek interests including the economic zone of the sea bed in the Aegean and Ionian seas. Since the end of the Cold War the ambit of Greek naval responsibility has included planning for operations aimed at preventing the development of regional crises and/or restoring international law and peace, and providing the allied naval forces with appropriate units to support the monitoring or enforcement of United Nations resolutions.

The composition of the Hellenic navy reflects these national and alliance priorities. In personnel terms the regular strength is approximately 19,500 (2600 officers) with a further 23,500 reservists. The Hellenic navy has four destroyers (*Charles F. Adams* class) and 11 frigates (six *Kortenaer*, three *Knox*, and two *Hydra* (Meko 200)) with anti-surface, anti-air, and anti-submarine capabilities for deployment in sea control missions. Sea denial roles are covered by eight Type 209 *Glavkos* submarines. The navy's ability to project power ashore with amphibious forces is provided by ten landing ships and 57 associated craft. Finally, it should be noted that the Greek

merchant marine plays a vital role in NATO military planning: it provides some 20 per cent of all merchant ships assigned to NATO, and 21 per cent of ships assigned for the trans-Atlantic sea lift of external reinforcements.

Throughout the centuries the interests of Greece have been sustained by its long-standing maritime tradition. In the words of a recent Chief of the Hellenic Navy General Staff: "Greece preserves its long naval tradition by maintaining a dominant presence in the [Mediterranean] area by the acquisition and operation of a substantially powerful, flexible and efficient naval force" (Drikos, 1992, p. 32).

Naxos

Island in the Cyclades

At 428 sq km in area, Naxos is the largest island of the Cyclades. It is also the most fertile, being provided with a large coastal plain to the southwest. The interior of the island is mountainous, the highest peak being Mount Zas, which takes its name from the father of the gods; an inscription on the mountain reads "Mountain of Zeus Milesios". The cave of Zas on this mountain is said to be the place where Zeus and Dionysus were reared, and Naxos is said to have been called both "Zia" and "Dionysia" in ancient times. Dionysus is especially associated with Naxos, where he was said to have taken Ariadne from Theseus. Fittingly, Naxos was known for its viticulture in ancient times and continues to produce wine to the present day. Other produce, such as grain, figs, olives, and citrus, is also abundant and it is not surprising that Naxos has been renowned for its prosperity.

Naxos is also rich in marble, as well as the emery used to work it. It is the sole source of emery in the Cyclades, and its white marble is plentiful but coarser than Parian marble. Naxian sculptors are first in evidence in the early Cycladic period, when they produced fine vessels and the stylized figures with triangular heads that are unique to the Cycladic culture. Many have been found in the area of Grotta, near the site of modern Naxos city, which appears to have been inhabited almost continuously over the past 5000 years. The later Bronze Age was less productive, but at the beginning of the Archaic period in the late 7th century BC Naxos was at the forefront of Greek marble sculpture production. Indeed, it has as good a claim as anywhere in Greece to be the birthplace of the Archaic style of monumental statuary. The nearby island of Delos received many statues from Naxos, including the female figure dedicated by Nikandre, which is the earliest surviving complete marble statue of monumental size, the Naxian sphinx, and a colossal *kouros*, which was famous in ancient times but is now lost. *Kouroi* were youthful male figures, pictured naked with one foot advanced, and often associated with Apollo. They are the most abundant Naxian work, including several unfinished sculptures remaining in Naxian quarries. A 10m-long unfinished colossus is locally believed to represent Apollo, but has a wedge left by the chin that could represent a beard, in which case it would be disqualified as a *kouros*. The entire area of the quarry is, in fact, associated with Apollo, including the nearby village of Apollonia. A large marble temple, variously attributed to Apollo and Dionysus, was erected on a small island outside Naxos city. It is said to have been commissioned by the tyrant Lygdamis. Today only a pair of doorposts and a lintel remain as a landmark. By the time that sculpture passed into the severe Classical style in the late 6th century BC, Naxian marble had faded from prominence. The reasons for this decline, and for the unfinished statues, are unknown.

Lygdamis had risen to power in Naxos in the middle of the 6th century BC, and carved himself an empire in the surrounding islands with the help of Pisistratus, tyrant of Athens, to whom he had given aid at the time of his exile and restoration. By 528 BC the Naxian tyranny had weakened, and the deposed oligarchs were recalled. Interestingly, among the few records of these events, there is mention of unfinished statues to be returned to them. Twelve years later, according to Diodorus, the Naxians controlled a thalassocracy, which lasted a decade. Coinage was becoming widespread in the Aegean at this time, and Naxian influence on the silver trade may have led to the story that coinage was invented on Naxos. In 499 BC the island was conquered by the Persians. The Naxians helped to expel the Persians in the last stages of the war, but did not fully regain their former power. They joined the Delian League, then later resigned from it. Athenian influence was succeeded by Spartan after the Peloponnesian War, although Naxos was the site of a major Athenian victory in 376 BC.

Naxos: view of Naxos town: 360 years of Venetian rule have left their mark on the island, not least in the survival of a substantial Roman Catholic minority in the upper town

Along with the rest of Greece, Naxos passed through the control of the Macedonian, Roman, and Byzantine empires. After the Fourth Crusade in 1204 the Venetians gained title to the Cyclades. The produce and emery of Naxos were among the goods that made them eager to secure the islands for trade, but not so eager that the state was prepared to undertake their governance directly. Instead, a Venetian of prominent family, Marco Sanudo, was given official sanction to capture what he could. He besieged and conquered Naxos, then took the neighbouring islands without resistance, establishing Naxos as the capital of the Duchy of the Archipelago by 1207. The Sanudi built many towers and fortifications, the most notable being the fortified upper section of Naxos city, which remains predominantly Roman Catholic in contrast to the Greek Orthodoxy of the rest of the island. The Crispi dukes succeeded the Sanudi around the time of the Turkish conquest of mainland Greece. Although the Turks did not take control of the duchy until 1564, they twice ravaged Naxos and demanded tribute. Piracy was also taking a toll at this time, as it had frequently in the past, and the people of Naxos became impoverished and discontented. Finally, the last of the Crispi line so disgusted his subjects that they volunteered to accept another ruler from the Turks. Unlike the Franks, the Turks never settled on Naxos, only sending necessary officials. In 1821 the Naxians won their independence, and in 1830 they joined the new Greek state. At that time the people of Naxos, especially those living in remote mountain villages, retained many uniquely Hellenic traditions and practices, having felt little outside influence for many centuries, despite their foreign rulers.

Summary

The largest island of the Cyclades, Naxos is rich in marble and emery. Naxian sculptors were prominent in the Cycladic period and especially in the Archaic age. In the late 6th century Naxos dominated the Cyclades. After the Fourth Crusade in the early 13th century Naxos became the capital of the Duchy of the Archipelago. It fell to the Turks in 1564.

Necromancy

Belief in necromancy, the employment of the spirits of the dead in divinatory or magical techniques, is attested from almost all periods of the Greek tradition; while treated with disapproval or scepticism by some, and at times subject to harsh legal sanctions, its existence and validity appear, nevertheless, to have been widely accepted on a popular level. It forms only one part of a much wider range of belief and practice concerning the dead within this tradition, however, and also contains elements drawn over time from neighbouring cultures, such as Judaism.

Although the idea of necromancy almost certainly goes back to prehistoric times, the first evidence for it in the Greek literary tradition is found in the *Odyssey* of Homer (10. 501–11) where an elaborate sacrificial ritual for summoning the spirits of the dead is described by Circe and then carried out by Odysseus and his men. A number of references to it in writings of the Classical period suggest a general attitude of intellectual scepticism but popular belief (see, for example, Aeschylus' *Persae*, 609–842, Aristophanes' *Birds*, 1553ff., and Plato's *Laws*, 10. 909b; cf. 11. 933a–e). Herodotus (5. 92) recounts how the Corinthian tyrant Periander sought the help of the oracle of the dead on the river Acheron in Thesprotia and, much later, Plutarch (*Consolatio ad Apollonium*, 109b-d) also refers to such a cult (*psychomanteion*); in the latter case, at least, the ritual concluded in an incubation, with the spirits appearing and revealing in a dream vision the information being sought. Evidence that necromancy continued to find a place in the Greek tradition during the Roman imperial period may also be found, for example, in such works as Lucian's satirical *Menippus* (or *Nekyomanteia*), written in the 2nd century AD, and Heliodorus' *Aethiopica* (6. 14–15), written in the 3rd; both describe necromantic practices in some detail and at least provide evidence of popular views on the subject, if not necessarily of their own belief in its efficacy or acceptability. The information they give is paralleled by contemporary treatments of the subject in a number of Latin authors, while the Romans legislated severely against necromancy and various references show that the allegation of involvement with it could form a useful and dangerous weapon for attacking political or other opponents.

Apart from information to be obtained from literature, there is also a wealth of material evidence for belief in necromancy from the older Greek tradition, particularly in the form of inscribed curse tablets. These tablets, together with bound figurines and similar objects that belong to related practices, were being placed in graves and at other places where the spirits of the dead might be thought to lurk from at least the 5th century BC, but their use appears to have been most common in the Hellenistic era and does not fade away until the advent of Christianity. Material evidence of ancient necromantic practice also comes from archaeological excavations such as those near Ephyre in Epirus which have uncovered the remains of an elaborate oracle of the dead, evidently conducted in an underground chamber beneath a sanctuary complex; there are many indications (see, for example, the episode recounted by Herodotus) that this area around the river Acheron was that most widely associated in Greek antiquity with necromantic rituals, but it seems that similar oracles existed from time to time at other locations notorious as entrances to the underworld. The oracle of Ephyre, which evidently developed from the 4th century to peak in the 3rd and 2nd centuries BC, appears to demonstrate that necromancy was not confined to individual belief and practice but also played a role in highly organized and officially sanctioned oracular cults, although some have challenged this view.

Much of the information on necromancy provided by the various literary sources, as well as that derived from the curse tablets, tallies closely with technical material on the subject to be found in surviving manuals of magic. Thus many passages in the Greek magical papyri (2nd century BC to 5th century AD) reveal that the spirits, or perhaps "ghosts" of the dead (the usual term is *nekydaimon*), were believed to act as intermediaries between the magician and the chthonic powers; especially useful were those thought to be trapped in some way between the worlds of the living and the dead, those, for example, who had suffered an untimely or violent death (the *aoroi* or *biaiothanatoi*). Made vulnerable and weak by their marginal status, these souls still possessed the power to bridge the divide between the different levels of existence and so were ideal instruments of the magician in effectuating the aims of a particular procedure, whether this was a curse, a love spell, or a divination. Furthermore, because these spirits fell within the sphere of control normally ascribed to the major deities of the underworld and to others, such as Hecate or Hermes Psychopompus, these greater powers also came to be associated with and invoked in such magical procedures as attempts were made to ensure their compliance. At other times in these sources, however, the notion of the spirits of the dead as mere intermediaries (and often as more or less witless beings) is replaced by one that treats them as malevolent forces in their own right, quite capable of vindictively pursuing the victims of the magician who is manipulating them and, indeed, of turning on their employer if due precautions are not taken. In both cases, however, it is clear that the spirits of the dead were thought to be of crucial importance in empowering many techniques of ancient Greek magic and this undoubtedly explains why, at least in popular belief, magicians were associated with such things as the theft of corpses, ritual murder, and infanticide.

Although the Church always strongly condemned belief in magic and sought to discredit its intellectual foundations, the emergence of Christianity did not immediately destroy belief in necromancy. The story of the "witch" (*engastrimythos*) of Endor in the Old Testament (1 Samuel 28:3–25), in which Saul consulted the spirit of Samuel in an undeniably necromantic ritual that correctly predicted his imminent death, thus appeared to provide clear biblical validation for the concept, although a more doctrinally acceptable explanation was available. Indeed, even the central events of the Christian story, the death and resurrection of Jesus, might, to those unversed in the

niceties of theology, appear to be the ultimate proof that the souls of those who had died an untimely and violent death could act as intermediaries between the worlds of the living and the dead, while certain elements in the cult of saints and their relics might also reflect necromantic tendencies.

Passing references to necromancy in the works of writers from all periods of the Byzantine era (e.g. from Iamblichus, John Chrysostom, and Synesius of Cyrene in the 4th and 5th centuries AD to Nikephoros Gregoras in the 14th) confirm that it continued to find at least some place in conceptions of divination and magic. Indeed, necromantic techniques are also generally implicit, if only occasionally explicit, in many of the procedures outlined in Byzantine and early modern magical manuals dating from the 15th–19th centuries; the most common summoning and divinatory rituals are thus clear survivals of ancient traditions that originally involved using the spirits of the dead as intermediaries. It is nonetheless clear that distinctions between various supernatural intermediaries apparent in the ancient tradition were largely lost in this period. Orthodox Byzantines, echoing the doctrinally acceptable explanation for necromancy that was developed by the early Christian Fathers, did not view the spirits employed in it as actually being those of the dead but rather as demons disguised as such. As the rich variety of ancient spiritual beings was reformulated into the simpler paradigm of the demons that Christian culture had created, explicit awareness of much of the old content of the magical tradition disappeared, including ideas of necromancy: it seems likely that even the practitioners of sorcery in later periods may have been unaware that many of the rituals prescribed in their manuals were originally necromantic techniques as opposed to methods of summoning and manipulating demons.

This process appears to have continued and, in common with a decline noticeable in many magical practices and beliefs, most explicit traces of necromancy disappeared from the Greek tradition in the 20th century. There is, however, evidence that, as late as the 1970s, villagers still believed that the old methods of divination and sorcery, implicitly underpinned by necromantic techniques, were being practised by professional magicians, and some divinatory practices (such as forms of lecanomancy) associated with necromancy in the ancient world survive to this day.

Nektarios of Aegina, St 1846–1920

Metropolitan of Pentapolis

St Nektarios of Aegina is probably the most widely revered modern saint in the Greek Orthodox world. Canonized by the ecumenical patriarchate in 1961, he was the object of local veneration from the time of his death, and reports of the miraculous cures effected by prayer at his tomb or use of oil from the lamp hanging above it rapidly spread his fame. More than 20 churches in Greece are dedicated to him, and others have been erected throughout the Greek diaspora.

Although consecrated metropolitan of Pentapolis (with effective control of the Alexandrian patriarchate churches in Egypt) at the age of 46, Nektarios was never a successful Church establishment figure. He was suspended from office a year later, and subsequently asked to leave Egypt, for "moral and ethical" reasons "known to the patriarchate"; and although retaining the title of metropolitan, he was never to serve as a hierarch again (the patriarchate of Alexandria was finally to rescind his suspension in 1998, expressing regret at his treatment and naming 1999 "the year of St Nektarios"). His irregular canonical status as a priest unattached to any jurisdiction was never resolved, and his subsequent posts (as preacher in Euboea and Phthiotis, and subsequently as director of the Rizarios school, a secondary school and seminary in Athens) were gained on the strength of his academic theological education at Athens university and the intercession of influential Egyptian friends. Similarly, the canonical status of the nunnery that he founded on Aegina in 1904 remained unresolved at the time of his death 16 years later, as did the status of two female subdeacons whom he had ordained there during the last years of his life.

Nektarios was a prolific writer throughout his life, a systematic and thorough expounder of dogmatics, ethics, and pastoral theology: many of his books were intended for class use in the Rizarios school or as handbooks for the clergy. He shows an extensive knowledge of the Fathers, especially the Three Hierarchs, the hesychasts, the Fathers of the *Philokalia* and St Nikodemos of the Holy Mountain, and the Kollyvades, but also does not hesitate to draw upon the philosophers of Classical Greece. Writing at a time when Athens was under the influence of a westernized court, he is careful to point up the differences between Orthodox, Protestant, and Roman

Catholic positions on such questions as papal supremacy and the *filioque*, and compiled a two-volume history of the Great Schism which asserted the impossibility of reunion. He also wrote several volumes of religious poetry for private devotional use, a *Catechism*, and a harmony of the Gospels based upon Tischendorf's *Synopsis Evangelica*. With the spread of his cult in recent years many of these volumes have been reprinted.

Nektarios was deeply concerned by the inability of the contemporary Church to respond to the challenges posed by westernization, scientism, and the scepticism of a newly educated laity: many of the upper clergy were in his view cynical careerists, while rural priests had little theological knowledge. Being denied active participation in the Church's ministry, he sought to remedy these needs by education, first by training seminarians who were both spiritually and dogmatically competent, and later by a project (unrealized) for a girls' school adjacent to his monastery on Aegina offering a syllabus of religion, ethics, handicrafts, and home economics. Nektarios realized that "in educating the mothers we educate their children", and often quoted St Kosmas the Aetolian's slogan "schools–letters–schools". His foundation of a nunnery dedicated to the Holy Trinity on Aegina, although primarily a response to a direct request from a group of his spiritual children, may also have been an active response to the low ebb of much contemporary monasticism: it may not be insignificant that one of the convent's founding members (and its first abbess) had home connections with the founder of the Zoe movement.

Throughout his life those that knew him were impressed by the saint's spiritual charisma (he was a constant practitioner of the Jesus Prayer), by his unfailing self-sacrificial generosity towards those in need, and by his spiritual power as a preacher, confessor, and exorcist. He gave his own clothes away to the poor, and rebuilt the ruined church and conventual buildings of the Aegina nunnery at his own expense. He raised the theological standards and the spiritual tone of the Rizarios school, where many key churchmen of the interwar years passed through his hands, but was frequently at odds with the school governors, whose accusations of organizational incompetence were given seeming weight by his customary refusal, following the example of Christ, to speak in his own defence or to spare financial thought for the morrow.

It is perhaps ironical that St Nektarios should gain widespread veneration as a posthumous wonderworker: his own writings on the miraculous (e.g. *God's Revelation to the World*, 1892) address with caution the radically divided attitudes of his contemporaries – suspicion and contempt among the educated (including many of the higher clergy), and uncritical adulation from the ignorant. Nektarios defends the reality of miracles as a means of divine self-revelation, and insists that their breach of natural laws must be viewed as evidence for the existence of a spiritual domain within the natural, where such laws do not obtain; but he also emphasizes that miracles were never intended as a basis for faith, and can never replace the believer's life of prayer and obedience to the gospels.

D.J. EDMONDS

Biography

Born Anastasios Kephalas in 1846, Nektarios studied theology at the University of Athens. He was consecrated Metropolitan of Pentapolis in 1892 but suspended in 1893 and later asked to leave Egypt. He became a preacher in Euboea and Director of the Rizarios school in Athens. In 1904 he founded the nunnery of Hagia Trias on Aegina. He died in 1920 and was canonized in 1961, the first modern saint of the Orthodox Church.

Nemesius

Bishop of Emesa in the late 4th century

More is known of Emesa than of this bishop of the see. Situated on the Orontes in Syria, it reached a level of modest prosperity. What may be said with certainty about Nemesius is to be derived from an analysis of his treatise *On Human Nature*. Attempts have been made to identify him with the Nemesius with whom Gregory of Nazianzus was acquainted. He was a pagan, a governor of Cappadocia, in whom Gregory detected signs of Christian sympathy, even the possibility of his being won over to the faith. Gregory addressed four letters to him, also dedicating a poem urging conversion. Such an identification is only conjecture, calling as it would for acceptance of the view that he had, in fact, been converted *c.*390, encompassing within a decade elevation to the episcopate, the composition of a treatise, and death. It seems wiser to remain content with ignorance of his life and concentrate on his writing.

Written by a bishop, emerging as significant in apologetic terms, and with relevance for specifically theological debates of its day, *On Human Nature* incorporates a wide conspectus of non-Christian thinking on the nature of the psyche, as Nemesius reviews a selection of opinions drawn from writers including Plato, Aristotle, Epicurus, Plotinus, Porphyry, Iamblichus, Posidonius, among other Stoics, and Galen. In a treatise that appears not to have been finished (there are references to discussions never written) there are inconsistencies and ambiguities. Yet it is worthy of study, containing a serious exploration of long-standing questions of the body–soul relationship.

In attempting to represent a human being as an identifiable psychophysical entity, Nemesius shows Neoplatonic influence. The psyche is immaterial, its highest part being *nous* ("intellect"), and the argument is developed on regular anti-Stoic

lines. Yet he never plays down the essentially Christian doctrine that the soul, no less than the body, is part of the created order. He presents the human being as a microcosm, an image of the whole of creation, the bond (*syndesmos*) of creation, a being on the borderline of the intelligible and the sensible worlds, which, since both are part of divine creation, are not dualistically opposed but are capable of meeting in humanity, spirit, and matter harmoniously combined into a unity. The status of mankind is stressed in the view that the whole of the rest of creation exists for the benefit of man. He lives within the constraints of physical existence, while preserving an essential kinship with the intelligible through the rationality of the human mind. The soul, however, is not pure reason, in its embodied state being linked with passions. There is some ambiguity, coming from his Neoplatonic predilections, as to whether the soul may nevertheless remain in some recognizable sense impassible. Nemesius has his own borderline positions. It is still clear that, whatever his tensions, he contrives to maintain some firm views. He is committed to the reality of human free will, over against fatalism of any kind, whether it be Stoic or grounded in the Manichaean dualism to which his native Syria was prone. Again, his knowledge of the human body, derived from medical writers such as Galen, is extensively used in his writing and shows a deep interest in the whole human person. Physiology is no embarrassment. Rather it is the start of an exploration into the interaction of soul and body, of the modifications that can be traced within what is perceived as a psychophysical unity. Importantly, the senses are given a place of respect as a fascinating part of the whole human composition.

While this work aims at a survey of non-Christian sources, it still reflects interest in specific contemporary concerns of the Christian Church. In Christology Nemesius shows affinities with Antiochene thinkers such as Theodore of Mopsuestia in stressing the completeness of the human nature taken by Christ, being critical of what he saw as the deficiency of Apollinarius in this respect. Eunomius, representing a form of Arianism attacked by the Cappadocians, was from another angle subject to the censure of Nemesius.

Shadowy though he may have been, Nemesius cast certain shadows before him, aided perhaps by his very obscurity. The attribution of *On Human Nature* to Gregory of Nyssa, whose own writings on the soul were well known, and with whom Nemesius has affinities, must have furthered the promulgation and acceptance of the work. John of Damascus draws on it extensively, bestowing the authority of one who was widely seen as the culmination of Greek patristic theology, while its translation into Latin made it accessible to Albertus Magnus and Thomas Aquinas. Again, during the Renaissance, Nemesius emerged into publication, sometimes disguised as Gregory of Nyssa, but increasingly often recognized under his own name. As well as influencing the theory of Christian anthropology, this "Christian eclecticism" (Gilson) has been thought to affect later Byzantine aesthetic perceptions, as Nemesius' awareness of the value of the sense of touch led to a greater appreciation of the tactile in art.

D.A. SYKES

Biography

Nothing is known of the life of this 4th-century bishop of Emesa in Syria except that he was the author of a treatise on the nature of the psyche called *On Human Nature*. It is a survey of non-Christian sources but it reflects interest in contemporary concerns of the Christian Church.

Neo-Orthodoxy

The term "Neo-Orthodoxy" has been widely used in Greece since the 1980s to designate an unorganized and multi-dimensional religious and intellectual current. The term was coined from the leftist journal *Scholiastis* in 1983 as a negative characterization of the religious quest of some left-wing intellectuals, men of letters, and artists (e.g. S. Ramphos, K. Zouraris, K. Moskof, D. Savvopoulos, N.-G. Pentzikis) who showed an unusual degree of interest in the Orthodox tradition and in the spiritual legacy of Athonite monasticism. These personalities from the left camp, which had never traditionally been on good terms with religion in general, were influenced by some progressive theologians and clerics (e.g. C. Yannaras, P. Nellas, abbot Vasileios Gontikakis). These had inititated a fresh quest for the rediscovery of a forgotten but authentic Orthodox tradition (e.g. the hesychast tradition of the 14th century), away from the conventionalism of the Church hierarchy, the pietistic precepts of Orthodox fundamentalists, and the superficial acquaintance of the general Greek public with Orthodoxy. This quest was thought to be a productive encounter with the genuine, uncontaminated sources of Greek Orthodox civilization, clearly differentiated from the West. Yet, the individuals involved in this movement never accepted the term of opprobrium "Neo-Orthodox", which they consid-

ered misleading. This term, nevertheless, has been generally established and used, in journalistic and scholarly circles alike.

Because Neo-Orthodoxy was in essence an unsystematic endeavour, no clear definition of the movement has yet been provided. Neo-Orthodoxy was not some sort of Orthodox revival, which has been a much wider phenomenon since the 1960s. It is therefore preferable to describe Neo-Orthodoxy with reference to some important events of the early 1980s: an unofficial dialogue between Orthodoxy (as differentiated from Western Christianity) and Marxism/communism; a tract from the Holy Community of Mount Athos concerning the education of the Greek nation; a widespread interest in Athonite monasticism and Orthodox spirituality; the debates concerning C. Yannaras's election to a chair of philosophy at the Panteion University of Athens, and heated discussions about the relationship between philosophy and theology as well as between Orthodoxy and rationality; the appearance of the new theological journal *Synaxi*, in which articles by Neo-Orthodox thinkers were published; the first publication in 1983 of *Oramata kai Thavmata* [Visions and Marvels] by the War of Independence general Yannis Makriyannis, which was considered to be an authentic document of the popular Orthodox ethos; and finally, the record *Ta Trapezakia Exo* [The Tables Outside] and various interviews by the popular singer D. Savvopoulos, who often and explicitly acknowledged his great debt to Orthodoxy. These examples reveal various enquiries in the religiocultural domain to locate the idiosyncrasy of the Greek Orthodox tradition.

Neo-Orthodoxy, however, was initially a marginal and remained basically an elitist movement. It had no mass appeal, except among some educated individuals and certain university students (e.g. the Greek Christian Orthodox Socialist Youth and its journal *Simadia*). An important reason for this was that Neo-Orthodoxy was supported neither by the official Church nor by the political parties. Another reason was that the movement lacked the organization necessary to ensure its longevity and wider impact. Additional reasons can be found in the radical sociopolitical changes and the collapse of Marxism-Leninism in Eastern Europe, which has meant that the aim of an Orthodox–Marxist rapprochement has in fact been unproductive. These events notwithstanding, there was a renewed interest in Orthodoxy in Greece in the 1990s in the wake of the revival of Orthodoxy in former Eastern bloc countries. This enabled several Neo-Orthodox thinkers to become involved in a wider attempt to locate the particular Greek Orthodox way of life and to construct a modern Greek identity with reference to its Hellenic and Orthodox past in order to face the challenges of the modern competitive world system. Some Neo-Orthodox thinkers were consequently called Hellenocentric as well and the influence of their ideas was manifest in overt and covert forms alike. Though there was never an official Neo-Orthodox programme, it is useful to outline some basic features that characterize this broad current of ideas, in addition to the positive appreciation of Orthodoxy.

First, the Neo-Orthodox opposed the Orthodox hardliners, the uninformed neutrals, and the enthusiastic westernizers. They considered both the past and the modern Greek intelligentsia as myopic because of its neglect of Greece's own incomparable cultural resources. The result was the modern disorientation of the country between the Scylla of traditionalism and the Charybdis of modernity, viz. westernization. The Neo-Orthodox thus intended to consider the history of Greece from an inward perspective and not according to western historiographical presuppositions. Second, the Neo-Orthodox put particular emphasis on a personal, experiential philosophy as well as on a communal way of life, as exemplified in the communalist tradition of the Orthodox east during Byzantium and the Tourkokratia. This perspective understood the human person as an erotic being in relation to other humans and the entire material world. The idea of personhood constituted for the Neo-Orthodox a clear difference between the Orthodox ethos and western individualism. In this context, they also distinguished between religion and ecclesiastical Orthodoxy. The former signified the satisfaction of fragmented individualistic needs, the latter the total fulfilment of human life. Third, the Neo-orthodox attempted to find the diachronic elements of Greek Orthodox culture and the underlying structure of Hellenicity from ancient times through Byzantium to the present, away from western adulterating influences and indigenous distortions. They did not support the uninterrupted continuity (ethnic/national) of Hellenism over a span of 3,000 years, but looked for features of Greek duration, patent and latent alike, throughout this long period. For them, Hellenism never represented a narrow geographical area (*topos*), but a specific way (*tropos*) of life. Finally, the Neo-Orthodox emphasized the exquisite value and superiority of the Greek Orthodox culture as well as the "aristocracy" of the Greek nation. This entails the abandonment of the inferiority complex of modern Greeks, especially vis-à-vis the West and its cultural imperialism. Greek Orthodox culture has an unsurpassed cosmopolitan universalism and can furnish viable solutions to the pressing problems of the contemporary international environment. The Neo-Orthodox criticism of the West, however, does not mean its wholesale rejection, but a fruitful interaction with it.

In short, the Neo-Orthodox movement should be understood in relation to the deep identity crisis and orientation problems that have tantalized modern Greece since its foundation. Despite its influence on contemporary Orthodox theology and Greek culture in general, Neo-Orthodoxy has drawn serious criticism from various perspectives, Orthodox, Marxist, and otherwise, as an elitist, nationalistic, isolationist, illusory, idealized, ahistorical, unfounded, biased, and even heretical current. This is indicative of deep cleavages within the modern Greek religious, intellectual, and socio-political scene with regard to all aspects of Greek identity, namely its past, its present, and its future.

Neoclassicism

The establishment of the modern Greek state in 1833 signalled a concerted national turn towards ancient Greek culture. The monuments of Classical Athens provided initial inspiration. Neoclassical architecture, introduced by the Bavarian government (1833–62), became the dominant architectural style throughout the 19th century. It offered concrete references to the ancient Greek past and provided a common vocabulary for the modern Greek nation. Furthermore, as a widespread European style, it created a visual link between Athens and other European cities that Athens aimed to emulate. By the late 19th century, the development of new internal and external influences redefined the cultural orientation of the Greek nation, signalling a turn away from Neoclassicism, and towards a closer examination of local vernacular architecture.

While Classical architecture originated in ancient Greece, Neoclassicism was a western European architectural movement. Developed in the second half of the 18th century, it was initially inspired by Roman antiquities, because they were more accessible to European architects and scholars. A desire for adventure, archaeological curiosity, and the search for architectural inspiration were the main reasons that brought young architects first to the Italian peninsula, and later to Greece. Travel had always been an important aspect of architectural education, allowing one to experience important buildings in situ, and to expand one's knowledge beyond the few published examples. By the 18th century travel came to be expected of professional architects, while the range of architectural sites on the itinerary continuously expanded.

Although today the Parthenon is one of the most revered ancient buildings, its artistic prominence was not always undisputed. Originally, the ruins of Roman antiquity were considered superior to those of Greece, in part because the Greek works were less familiar to western scholars. During the Ottoman period, visits to the Greek lands were less common, being both cumbersome and expensive. The art historian J.J. Winckelmann was the first to challenge the artistic superiority of the Romans over the Greeks in his *Geschichte der Kunst des Alterthums* (1764); for him Hellenistic art was superior to both the Classical Greek and the Roman periods. The publications of Le Roy, *Les Ruines des plus beaux monuments de la Grèce* (1758), and especially Stuart and Revett, *The Antiquities of Athens* (1762–1830), offered the first scientific descriptions of Classical Greek architecture. By the early 19th century, taste and aesthetic preferences had shifted towards Greece, and the artistic production of Athens in the 5th century came to represent the highest standard of artistic excellence. But while antiquity provided the inspiration, 18th- and 19th-century architects could not simply copy existing ancient buildings. First of all, most of them lay in ruins, or were partially underground and had to be reconstructed in the imagination. Secondly, the functions of the ancient monuments differed radically from the needs of modern society. The layout, design requirements, and building materials of Neoclassical museums, hotels, private clubs, or banks were uniquely modern. It was rather in the relationship and proportion of the parts and in the decorative vocabulary that architects sought inspiration in antiquity.

After the establishment of the Greek kingdom, several young, foreign, and foreign-trained architects travelled to Greece, full of dreams for grand projects and archaeological restorations. Most notable among them were the Danish brothers Christian Hansen (1803–83) and Theophilos Hansen (1813–91), and the Greeks Stamatios Kleanthes (1802–62), who was trained in Berlin under Karl Friedrich Schinkel, and Lysandros Kaftantzoglou (1811–85), who was educated in the Academy of San Luca in Rome. The first major Neoclassical structure was the royal palace (1836–43), designed by Friedrich von Gaertner (1792–1847), who worked in Munich for Otho's father, king Ludwig, and came to Athens only briefly to supervise the construction. The imposing palace, while uninspired in its design, sent a welcome signal of permanence to the war-torn country. Its construction encouraged other wealthy Greeks from abroad to move to Greece and contribute to the country's reconstruction. Yet, it was the buildings of the Athenian trilogy – the University, the Academy, and the Library, all on Panepistimiou Street – that stamped the elegant Neoclassical vocabulary on the Athenian landscape, and were emulated by other architects and builders throughout the 19th century. The University (1839–64) was designed by Christian Hansen, while the Academy (1859–87) and the Library (1884–1902) were the work of his brother Theophilos. Also noteworthy are the Polytechnic (1861–76) and the Arsakeion School (1846–52) by Kaftantzoglou, the Archaeological Museum (1866–89), designed by Ludwig Lange (1808–68) and Panagiotes Kalkos (1818–75), and the Zappeion Exhibition Hall (1874–88) by F. Boulanger and T. Hansen.

Many of the architects involved in the rebuilding of Athens also worked on archaeological excavations and restorations. The simplicity and austerity of the ancient examples were often reflected in their own creations, thus forging a Neoclassical idiom that was unique to Greece. By the end of the 19th century, however, this simplicity gave way to a much more decorated style that also borrowed from the rounded forms of Italian Renaissance architecture. The most prominent architect

Neoclassicism: Athens University, designed by the Danish architect Christian Hansen in 1839–42

in the late 19th and early 20th century was the prolific Ernst Ziller (1837–1923), who designed the house of Heinrich Schliemann (1879), the Royal Theatre (1895–1901), several hotels and civic buildings, and numerous houses. In his competent hands, this turn-of-the-century development of ornate Neoclassicism became synonymous with national Greek architecture.

The Neoclassical style of the capital was quickly exported to the rest of Greece. In fact, some of the best-preserved examples of Neoclassical architecture can be found in the Aegean islands, notably in the capital of Syros, Hermoupolis, and in many cities of the mainland, for example, Piraeus, Nauplia, Patras, etc. Local builders, having been apprenticed under trained foreigners, went on to apply what they had learned to more modest building commissions of their own. Even humble residences began to assume a regular, symmetrical façade, a scaled-down version of the major Athenian structures.

Some scholars have also used the term "Neoclassical" to describe the rational, orthogonal town plans of the 18th and 19th centuries that were inspired by Enlightenment theories and were initiated by the army of Napoleon I in France and Italy. Engineers from the French army also laid out some of the first cities designed under the regimes of Kapodistria (1828–31) and Otho. Characterized by regular geometry and symmetry, the plans consisted of rectangular building blocks, arranged around a central civic and administrative square. These regularly planned cities provided the backdrop for the new civic buildings in the Neoclassical style that were erected after the liberation. In the period between 1828 and 1912, more than 175 settlements were planned on the Greek mainland. Among others, new plans were designed for the following cities and towns: Argos (1829), Corinth (1829), Patras (1829), Eretria (1834), Nauplia (1834), Sparta (1834), Kalamata (1860), Thebes (1879), Volos (1882), Larissa (1883), Amfissa (1896), etc. While these plans did not completely erase the existing street patterns, they imposed a high degree of regularity on them.

New plans signalled an era of independence from Ottoman rule, national unity, and westernization. Greece, of course, was not the only country to undergo such modernizing, urban transformations. In fact, the Ottoman empire also invited western-trained architects and planners to design new civic and government buildings and to make proposals for urban transformations. And many of the foreign architects who worked in Greece worked in other countries as well. Theophilos Hansen's design for the Vienna parliament (1874–83), for example, bears a marked resemblance to his design for the Athenian Academy. Nevertheless, while there are stylistic similarities among the various Neoclassical buildings in Europe, their symbolic meaning is closely tied to the specific history and

culture of each location. As the poet George Seferis remarked, the Athenian Academy is so embedded in the Greek culture that, "most of the time, when we speak about the Greekness of a work of art, we are speaking about the Academy building" (G. Seferis, *Dokimes*, vol. 1, 1974).

Though prominent, Neoclassicism was not the only architectural style in 19th-century Greece. Byzantine architecture also provided inspiration for new buildings, as is evident in the work of Kaftantzoglou, Kleanthes, and several other architects known primarily for their Neoclassical buildings. In fact, when Otho announced an architectural competition in 1846 for the completion of Athens cathedral, he stipulated that the design be in the Greek-Byzantine order. Connection with the Byzantine epoch strengthened the Christian tradition of the modern Greek nation and helped to forge a continuous historical line from antiquity to the present.

By the turn of the 20th century, the Classically based, intellectual underpinnings of the modern Greek culture were challenged by a new wave of writings that focused on local people, customs, and traditions. The architect Dimitris Pikionis (1887–1968) was one of the first to study the vernacular landscape, exalting the "natural" and "true" elements of Greek popular (*laiki*) architecture. He urged his students to study the methods of traditional builders and adapt them to their own designs. His own work, however, like the work of most of his contemporaries, while it borrowed extensively from local vernacular architecture, was also influenced by the international modern movement. The sunset of Neoclassicism in Greece, however, was not only the result of ideological shifts in architectural theory and practice. Increasingly, technological and industrial advancement, rather than attachment to antiquity, was considered the true demonstration of progress. An unstable economy, combined with the continuous military undertakings that came to an end with the Asia Minor disaster of 1922, also forced the country to concentrate on the present and the future. The few Neoclassical buildings that survived the wholesale rebuilding of the 1960s and 1970s are once again revered and restored, often to house the offices of banks, international companies, art galleries, and small hotels.

Neomartyrs

The Orthodox Church considers as neomartyrs all those who have been persecuted for their faith by heterodox oppressors. Although most of the new witnesses to the faith suffered martyrdom at the hands of their Muslim masters, it is wrong to impute their persecution only to the latter. The term neomartyr was used for the first time in the 8th century by the iconodules to qualify those persecuted for their Orthodox beliefs regarding the veneration of icons. Several cases of martyrdom occurred also during the reign of Michael VIII Palaiologos (1259–82) resulting from his policy on the union of the Churches, and under Frankish and Venetian rule.

Had it been possible to account for all the neomartyrs, including the 20 monks of the Mar Saba monastery in Palestine who were killed by the Arabs in 797, the 42 defenders of Amorion who refused to embrace Islam and died a martyr's death in 838, or the 13 monks killed under the Lusignans in Cyprus in 1231, with all the anonymous witnesses to the faith whose memory was lost through the long centuries of persecution and foreign invasion, the official count of 162 neomartyrs who fell during the period of Tourkokratia proper would easily swell to a few hundred.

The traditional martyrs of the early Church were primarily bearing witness to the faith they were holding; in a sense they were witnesses to the events directly related to their salvation. The neomartyrs were living testimonies of a more complex set of truths and values. In most cases they were forced formally to renounce their faith and embrace Islam. Their conversion implied not only a change of religion but the total denial of their identity. When they "turned Turk" they had to assume a foreign lifestyle, name, attire, manners, and, above all, a fundamental change of attitude towards their fellow Christians including members of their own family.

Akylina's father had converted to Islam to avoid punishment for killing a Turk. The girl, who was raised as a Christian, objected vehemently to embracing Islam and was brought by her own father to the Turkish authorities. All along she was encouraged by her mother not to renounce her ancestral faith. She was badly whipped for several days and she expired in her mother's arms on 27 September 1764.

For many renegades their apostasy came at a high price and led to banishment from their former community, bringing upon them hatred and isolation; life in these conditions, although relieved of the burden of excessive taxation imposed upon the non-Muslim Ottoman subjects, became unbearable and led to the repudiation of their former abjuration. This was usually followed by a sincere *metanoia* (repentance), a quest for guidance from a spiritual father, usually at an Athonite monastery, and an ardent desire to make in public a formal declaration of their ancestral faith. Their spiritual guides were reluctant in granting them permission to suffer martyrdom. Nevertheless, at their unmitigated insistence, they complied with their wish to efface the stigma of apostasy by an ultimate

act of sacrifice; indeed, martyrdom seemed to be the only honourable way to regain and reclaim their lost identity for all eternity.

The *Life* of St Polydoros of New Ephesus (first published in Venice in 1799) offers interesting details on the painful process undertaken by an apostate for his re-entrance into the Church. Having pronounced the *Shahada*, the Islamic confession of faith, in a bout of drunkenness while on a business trip to Egypt, he was unable to cope with the consequences of his conversion. He sought spiritual advice from a hierarch in Beirut, who advised him to retire to a monastery of Mount Lebanon. Desiring martyrdom, he went to Acre; from there he boarded a ship for Egypt and after several adventures he finally reached Smyrna with the intent of making a public confession of his faith; he was prevented from accomplishing this by the spiritual fathers of Smyrna, who were mindful of the consequences on the Christian population of a second martyrdom in the same city only a few weeks after the beheading of the neomartyr Alexander the Dervish. He left for Chios where he received approval for his martyrdom from "a foreign spiritual father". After an intense period of penance and preparation with fasting, prayers, genuflections, *parakliseis* to the Theotokos, and readings of martyrs' Lives, he came to such contrition, crying bitterly during many sleepless nights, sighing from the depths of his heart and calling on Theotokos to help him, so that those who saw and heard him were moved to profound mercy and sympathy. He went to New Ephesus (Kushadasi) where, following an illuminating interview with a Turkish judge, which includes a rare catechetical exposition of the faith to a non-Christian, and being offered the option of departing to live as a giaour, holding "whatever religion he may please, Frankish or Armenian", he persisted in his desire to die for Christ and he was hanged on 3 September 1794.

The Orthodox Church did not keep an official register of neomartyrs and never followed specific rules concerning the canonization of saints. St Nikodemos of the Holy Mountain put together a collection of *Lives* from hearsay and from *Lives* existing in manuscript form at the Athonite monasteries. Another source must have been the Akolouthiai, liturgical offices published for the local veneration of the neomartyrs. The ordering for the composition of such a service to commemorate the martyrdom of two Spezziots in Chios by "the Bishop of Scio" addressed in a letter to the Spezziots is quoted by Hasluck, who concludes that "the admonition of the bishop was duly attended to". The result of St Nikodemos's compilation is the *New Martyrologion*, published in 1799 in Venice. As is the case with other works of St Nikodemos, characterized by their popular tenor, the main purpose of this work was to stem the tide of apostasy and, as put forth in the Preface, to incite Christians "to burn from divine love, so that they also in turn may be ready to endure the martyrdom for Christ".

The inclusion of a neomartyr in the assembly of the saints was not necessarily dictated by ecclesiastical approval but rather by popular canonization and local veneration. A moving account of the local cult of an anonymous neomartyr of Skiathos (his name is rendered simply as the "Shepherd") is given by A. Papadiamantis in his short story "Poor Saint". St John the Russian was all but unknown in Greece until some Cappadocian refugees, following their exodus from Asia Minor, brought his miraculously preserved body from Prokopi to their new settlement of Neo Prokopi in Euboea in 1925.

It is important to note that in the assembly of neomartyrs several non-Greek Christians were venerated throughout the Orthodox world. Under the name of Ioannis alone one may count a Turkish dervish (?1814), Ioannis the Goldsmith from Sumna, Bulgaria (?1802), Ioannis the Wallachian (?1662), not to mention St John the Russian. One Ioannis from Trebizond, martyred in Akkerman (?1492), was buried in Suceava of Moldavia and his cult was popular throughout the Slavic world.

LAMBROS KAMPERIDIS

Summary

Neomartyrs are Christians who have been persecuted for their Orthodox faith. The term was first used in the 8th century to refer to those who defied iconoclasm. In the 13th century there were others who refused to accept the union of the Orthodox and Catholic Churches, but most suffered their martyrdom as a result of Muslim oppression during the Tourkokratia. For this period the official number stands at 162.

Neophytos Enkleistos 1134–1219

Cypriot monk

Neophytos Enkleistos (the Enclosed, or Recluse) was a Cypriot monk and author, an unusual founder of a famous monastic institution from the base of his cliff hermitage above Paphos. The site, still active today, has important frescos that indicate much about the process and understanding of sanctification in later Byzantine practice.

His life is given in his own autobiographical accounts which survive in the Typikon (monastic constitution) he wrote for his community. He was born near Leukara in southern Cyprus in 1134. In 1152, when he was 18, he left his family, which was poor, and was tonsured at the monastery of St John Chrysostom on Mount Koutzoubendi. Working there for five years in the vineyards, he received a literary education and was promoted to the office of subsacristan (parekklesiarch). In 1159, when he was 25, he made a pilgrimage to the Holy Land, visiting Jerusalem and the renowned monasteries of

Palestine. After spending some time in the Mar Saba monastery he was confirmed in his vocation to be a hermit. He tells, however, how a vision instructed him that God awaited him in another place, and so he made his way back to Cyprus. He left the monastery of Koutzoubendi, trying to make for the monasteries of Mount Latros where he intended to become a hermit. Arriving as an unknown in Paphos, and waiting to take ship there, he narrates his providential adventure, as he was taken for a deserter and thrown into the local prison. There he was robbed of the money he had for his fare, and only just escaped from a long term of imprisonment. Completely penniless, and shaken by his experience, he left Paphos and went a short distance up into the surrounding hill country looking for a suitable place of retirement. On 24 June 1159, a day that he regarded as auspicious, for it was the birthday of John the Baptist, patron of monks, he found a soft escarpment with a cave, at the end of a ravine. He tells how he tested the tranquillity of the site, living only with the wild birds, until September of that year when, satisfied as to its suitability, he began to enlarge the cave for his permanent use, completing his work on the Feast of the Cross (14 September) the following year.

After five years, in 1165, he set out to find a relic of the True Cross, indicating his intention to make a permanent religious foundation, and, being successful in his quest, brought it back for the cave church that he had made adjoining his cell. In 1166 he was also instructed by the newly elected bishop of Paphos, Basil Kinnamos, to receive ordination as a priest and to accept monastic followers. On the arrival of the early disciples, he enlarged the primitive Enkleistra, and it became a series of cells stretching across the whole length of the escarpment. The small church, dedicated to the Holy Cross, served as the Katholikon for the foundation, still reached by a ladder, though today an arched walkway has been constructed. In 1183, the 24th year of his seclusion, the whole cell and church were painted, under the patronage of Basil Kinnamos, by the fine iconographer Theodore Apseudes. The wall-paintings are among the most interesting on Cyprus, not only because of their quality, but for what they reveal historically, for the series most unusually depicts the founder Neophytos being carried to heaven by two angels – and this was painted several years before his death. After the initial paintings, in the late 12th or early 13th century, the nave of the church was enlarged once again and decorated with additional saintly ascetics and Passion scenes.

The depredations of Richard the Lionheart had caused much disruption to rural life on Cyprus, and Neophytos castigates the king in his writings. Pilgrims and aid-seekers began to cluster round the monastery, and many attempted to join the community. Neophytos regulated this by stating categorically in his Typikon that the foundation was not to receive monks unless they were genuine penitents (*Typike Diatheke*, 13), and for good measure he had this text written in the narthex of the church, and ordered it to be read aloud each Sunday. In 1196 the influx of monks and visitors seeking guidance and help became too much for the recluse, who decided to abandon his original cell and carve out a place for himself higher up the escarpment, much more difficult of access. The story of his adventures excavating this "New Sion" are recounted in a small work called *Theosemeia* in which he narrates his miraculous deliverance from a rock fall. The seclusion was so effective here that he seems to have been forgotten on more than one occasion (for he complains about it) when his community, overwhelmed with the needs of visitors, neglected to send him any food for the day. The original monastery was also enlarged, and he tells in the Typikon of the later gardens, herds, and buildings that had sprung up (*Typike Diatheke*, 18–20).

In this later period of expansion Neophytos developed his work of writing, setting out instructions for the permanent regulation of a community. Bishop Basil and his own brother John, who had become the *hegoumenos* (abbot) at Mount Koutzoubendi, encouraged him in his literary work. In addition to his monastic instructions, he also wrote panegyrics, homilies, and a commentary on the Song of Songs. His work shows an intelligent awareness even of theological controversies taking place in Palestine and Constantinople, as well as offering sharp comment on contemporary political problems in Cyprus. For 23 years he lived in strict seclusion in New Sion, acting as founder and *higumen* of the community around him, until his death in 1219. In accordance with instructions he gave in advance in the Typikon, a new *higumen* was chosen to succeed him, who was to be installed in the seclusion of the founder's cave after the customary funeral rites had been observed, and after the founder's body had been buried in the original cell below, which was now set apart as a shrine adjacent to the cave church.

The life of Neophytos has recently been interpreted as an example of blatant self-glorification. The preparing of a tomb for his body, together with frescos in the church where that body would be received, and the supplying of texts indicating both his stature as a founder and how the Theotokos miraculously saved him from death, have been pointed to as all the necessary elements to comprise a Byzantine "canonization" – icon, relics, and hagiography – which in this case had all been made ready by the protagonist himself before his death. Another commentator has called this not self-glorification but rather "une transparence enfantine". In the Byzantine religious mindset, however, it was a commonplace that the faithful pursuit of the monastic life would almost inevitably lead the founder (one seen as specially inspired by God) to heavenly glory. What strikes the modern observer as peculiarly self-aggrandizing is more a reflection of the widespread belief in the Byzantine ascetical doctrine of *apatheia*: that years of dedication to God in the monastic life would stabilize the "Abba" in the very life of God himself – a deification even in this world. The fresco that has caused most controversy is that of the founder, over the site of his tomb, being lifted up by two angels. This should be properly interpreted not as a pre-death self-canonization, but as an iconic prayer of intercession that the monk Neophytos, having lived the angelic life on earth (the monastic state), would be admitted into the company of the other monastic saints who line the walls of the church. It is also clear that this expectation that the monastic complex would continue to be a place of pilgrimage after the founder's death (as it had been already in his lifetime) was a view shared widely, not least by the bishop who commissioned the wall paintings, and by the larger community itself.

The monastic complex has survived to the present day with its (later) church and community buildings around a fountain

courtyard, opposite and below the surviving Byzantine troglodyte church and upper cell of the founder. The continuing popularity of the place testifies to the enduring warmth of the relationship between the Greeks and their local monastic settlements. There is a lively tradition of the later "invention" of the relics of the founder, and the saint's skull is today preserved in the lower church where it continues to act as a pilgrimage focus.

J.A. McGuckin

Biography

Born in 1134 in southern Cyprus, Neophytos "the Recluse" became a monk at the age of 18. In 1159 he visited the Holy Land and spent time at the Mar Saba monastery. Returning to Cyprus, he became a hermit above Paphos. He enlarged his cell to take disciples and it became a monastery. He died in 1219 and his relics remain a focus of pilgrimage.

Neoplatonism

"Neoplatonism" is a modern label for the Greek philosophy of the late ancient, early Byzantine period (late 3rd to 7th century AD). The label is inadequate. First, "Neoplatonism" amounted to Greek philosophy in general: it incorporated Aristotelian, Stoic, and Pythagorean tenets (Epicureanism was rejected) and had no other philosophical competitors. Second, there were many diverse, often rival, brands. Third, "Neoplatonism" is very different from the standard Plato, yet shows close links with some renditions of the late Plato and the early Academy. The Neoplatonists fostered allegiance to the Classical past (Neoplatonists wrote most of the commentaries on Aristotle and Plato), but simultaneously promoted a fresh, dynamic philosophy.

Neoplatonism was consolidated and brought into mainstream academic teaching by the Athenian school, and especially Proclus. Its principal founders were Plotinus, Porphyry, and Iamblichus.

The Neoplatonists were primarily philosophers with their own ideas about truth and reality. They reasoned that these come in degrees or levels, each appropriate to the means of knowledge in use. Sense-perception addresses the physical mode of things, reason the conceptual, abstract, or mathematical mode of things, and direct intellectual apprehension the essences, principles, and Forms of true reality. However, all knowledge and being derive from an ultimate principle, the "One", which by definition is beyond the system.

In descending order, the main metaphysical levels were, the One, Being/Intellect (*ousia/nous*), and Psyche (as self-organizing life/soul/mind). Body and Matter in themselves were considered passive. More detailed orderings made explicit the functions of the One (transcendent – causal, determinative – unlimited), and the structure of Being/Intellect as essence, potency (*dynamis*), and overt actuality (*energeia*).

Neoplatonism is neither just idealism nor realism. Objects are contained in consciousness, and differ according to the mode of awareness and cognition. At the level of pure intellection, being and thought coincide. However, phenomena and reliable conceptions depend on transpersonal realities, which are self-sufficient.

Psyche in Greek philosophy meant the self-propelled (*autokineton*) life that defines living beings. Human psyche consists of a rational (mind) and a non-rational life (self-movement, senses, instincts). With the psyche man can compare sense-perceptions and thoughts, mentally weigh evidence, and arrive at conclusions and understanding (*logos*). Each psyche, however, has only a "particular" perspective. Because of this combination of self-motivation and limited vision, which is its individuality, it "dares" to leave its level, and invariably "fall" into body. Yet, psyche is an extension of atemporal, unlimited, objective principles. To these it yearns to "ascend" by the Neoplatonic routes of love, contemplation, and faith.

From their readings the late Greek philosophers concluded that Plato was nearest to a complete account, provided his writings were interpreted correctly. Aristotle, Plato's rival, was valid for the domain of sense-experience, ordinary language, and basic logic. Neoplatonic education, as taught at Athens and Alexandria, thus started with Aristotle and progressed to Plato; studying could last six years. Learning stimulates the

soul to reflect on its self, and through it on the levels of reality that substantiate it. Salvation comes with the deepening of knowledge, for philosophy aids the soul to recover its full integrity. This is preserved by a unity, which is of divine origin.

Accordingly, Neoplatonists studied an encyclopaedic range of subjects and philosophies, including literary works and criticism, psychology, politics, Pythagoreanism, Stoicism, and Hedonism. First they trained in ethics and logic, i.e. the basics of good living and sound reasoning. Then they learnt physics and mathematics (geometry, arithmetic, astronomy, and harmonics) as the representations of reality. Thinking about being, existence, properties, and causes, and about concepts, knowledge, and truth brought the students nearer to the core concerns. In the final step of "analysis", they encountered the ultimate foundation of metaphysics, epistemology, and ethics: the unconditioned, ineffable unity, whose traditional appellation is God.

Plotinus (3rd century AD) was born in Hellenized Egypt, and first sought philosophy with the scholastic teachers of Alexandria. Having found them disappointing, he turned to an Ammonius Saccas, who propounded the agreement of Plato with Aristotle. Among his audience were Longinus and the Christian Origen. After 11 years, and a short adventure in the East, Plotinus settled in Rome, where he attracted a large circle of followers, including senators.

For Plotinus, inward contemplation of human nature takes the philosopher on a journey of discovery. Man's inner capacities reveal universal realities, and exemplify deep philosophical issues. The relation of body with psyche, for example, shows the difficulty of referencing immaterial existence by the normal material-bound standards. He regarded Plato correct, and Aristotle selectively wrong, especially on the categories of being. Yet, Plotinus' doctrines were not dogmas but the results of lengthy debates with his followers. He was conscious of his unorthodox Platonism: that the Forms are identical with the contents of divine Intellect (interpretation traceable to the 2nd-century Aristotelian professor Alexander of Aphrodisias), and that an aspect of human psyche remains undescended in body. Later Neoplatonists accepted a modified articulation of the former, but rejected the latter.

Plotinus' writings were edited and publicized by Porphyry. Although Porphyry records their chronological order, he arranged them in six thematic groups of nine, henceforth known as the *Enneads*. In this they conform to an ascending scale from ethics and physics, to psyche, *nous*, and finally on to the divine One. This is the hierarchy of virtue, being, and knowledge, which will typify later Neoplatonism and its curriculum.

Porphyry (3rd to early 4th century AD) was born in Hellenized Phoenicia of Syrian parents, and first studied at Athens with the prominent scholastic Longinus. From him he inherited breadth of learning and source material, organized, critical thinking, and clear, concise expression. However, he became more attracted to Plotinus' philosophy. After five years, he disagreed with Plotinus, left him, and pursued his "harmonization" of Aristotle's logic and metaphysics with Plato. Nevertheless, Plotinus entrusted him with the publication of his doctrines. Porphyry disseminated widely their new philosophy with his numerous writings (including a key work on vegetarianism and ecological philosophy) and high scholarly reputation.

For Porphyry, Aristotle is true, within the limits of sense-experience, physical reference, logic, and semantics. Plato addresses the intelligible but intangible reality. In ethics and religion, Porphyry promoted the ideal of the simple living philosopher-priest. He was the first to write on the "Chaldaean Oracles", proverbs written in Greek but of uncertain origin, that later Neoplatonists used as revelatory support for their ideas; he was also the first to elevate faith, love, and truth alike to the divine virtues. Porphyry saw reason as the surest path to God, and rejected Christianity and Gnosticism as irrational or fraudulent. Indeed, the "harmonization" was motivated by his concern to defend Hellenic philosophy.

In the meantime, Plotinus' chief spokesman, Amelius, had also left him and settled in Apamea, Syria. Amelius bravely postulated that the Platonic Forms must be infinite (subsequent Neoplatonists rejected it), and, unlike Porphyry, believed that ritual practices enable contact with divinity. Further, he introduced a tripartite distinction in *nous*. His first doctrine influenced Theodore of Asine, a student of Iamblichus, but was rejected by other Neoplatonists. The last two show influence from Numenius, a Neopythagorean who flourished at Apamea in the 2nd century AD. He had introduced ideas later typical of Neoplatonism (Plotinus was once accused of plagiarizing Numenius): the Forms as contents of *nous*, threefold divisions, the Pythagorean reading of Plato, theurgy, and the value of revelatory oracles.

The Syrian Iamblichus (4th century) was at first an acolyte of Porphyry, but disagreed over the role of theurgy. After a short stay at Caesarea, he established a school at Apamea, which seems to have offered both philosophy and conventional rhetorical education. Iamblichus' school proved exceptionally popular, only to be surpassed by that of his student Aedesius the Cappadocian, at Pergamum. Their students spread and influenced the Byzantine empire from its very beginning. Iamblichus' student Sopater of Apamea advised the emperor Constantine the Great, and presided over the consecration of Constantinople's foundation in 330. Aedesius, through Maximus of Ephesus, converted the emperor Julian (361–3) from Christianity to a universalist "Hellenism".

Iamblichus took Porphyry's "harmonization" of Aristotle with Plato further into ontology and psychology, and added Neopythagorean number metaphysics. He sought to mathematize all areas of philosophy and religion, because mathematics made possible their scientific study. He analysed the Neoplatonic levels into transcendent and immanent aspects, and, for the first time, he saw time not as a by-product of psychological activity but as substantial reality. He concluded, against Porphyry, that divinity cannot be reached by reason but by an appropriate act of transcendence: supra-rational theurgy. Against Plotinus, he pointed out that embodied souls do not access higher planes, but are fully immanent in matter. Nevertheless, they contain a divine spark which is the source of salvation both of individual souls and of matter.

The Iamblichean version incorporated most of Porphyry and Plotinus, but rejected Theodore of Asine. In a modified form it was eventually accepted by the chief mainstream schools of Athens and Alexandria. Through them the

Neoplatonic educational philosophy became the curriculum of Byzantine higher educarion until the 15th century.

At Athens in the late 4th to 5th centuries AD, the self-styled "Academy" was the premier centre of higher learning, and the beneficiary of major endowments by aristocratic families. It was successively headed by Plutarch of Athens, Syrianus, and Proclus. They taught a curriculum mainly based on Aristotle and Plato, where the former is the necessary preparation for the latter. Against Iamblichus, they restored Plato's dialectic over Pythagorean number metaphysics, and a single One as both transcendent and causal. The Athenians' theoretical developments included the "ones" (*henades*) as the transcendent existents and essences of beings at all levels, matter as the direct emanation of the One and Good, space as body and light, etc.

Proclus was succeeded by Marinus and Isidore. The last scholarch of Athens was Damascius (taught by Ammonius Hermeiae at Alexandria). He highlighted the metaphysical, epistemological, and linguistic problems of transcendence, which led him to new expressions of scepticism (theology as scepticism relative to dogmatic rationalism and science resurfaced periodically, notably in the 13th-century Byzantine Metochites). With the emperor Justinian's ban on public teaching by pagans in 529, the Athenian school closed. After an unsuccessful journey to the Persian emperor, the Athenian scholars dispersed. But one of them, Simplicius, flourished after the closure, writing and teaching privately somewhere in the Byzantine empire. He wrote the most extensive commentaries on Aristotle. They are invaluable for both new and old ideas, particularly the reports of the first Greek philosophers, the Presocratics.

In this period, Alexandrian philosophy came from Athens. The first to be unambiguously a philosopher at Alexandria was Hierocles, a student of Plutarch of Athens. The next head, Hermeias, was taught by Syrianus (to whom he was related), and was succeeded by his son Ammonius, taught by Proclus. Ammonius of Hermeias, in turn, taught Damascius, Simplicius, and John Philoponus who edited several of Ammonius' lectures, which had originated in Proclus. Some evidence suggests that the Alexandrians were specially interested in the relation of Being to divine Intellect.

The Alexandrian school was not as rich or self-sufficient as the Athenian, which was the complaint of its next head, Olympiodorus. Yet, he continued to flourish even after Justinian's ban, still as a pagan public teacher. It is evident from Olympiodorus' lectures that he was the first to promote deliberately the conciliation of "Hellenic" philosophy (Neoplatonism) with Christianity, in the classroom. All subsequent heads at Alexandria were Christians but philosophically remained Neoplatonists. One of its later members, Stephanus, took the sole philosophy chair at the imperial university of Constantinople (610).

Greek Christians influenced by Neoplatonism included the Cappadocian Fathers of Orthodoxy, Basil, Gregory of Nazianzus, and Gregory of Nyssa (4th century). They were educated at Caesarea, Athens, and Alexandria. There they learnt the power of logical argument and the sophistication of Greek philosophy through Neoplatonism. Familiarity with Plotinus and Porphyry is evident, as well as exposure to Iamblichean ideas, which were prevalent at that time and place. For example, God's creation is expressed in "remaining, procession, and return", while God's wisdom emanates as light. In Christian theology, the Cappadocians were influenced by Origen (3rd century) who had been a fellow student of Plotinus under Ammonius Saccas at Alexandria.

In early to mid 6th-century Alexandria, a Christian student of the Neoplatonist Ammonius, the grammarian John Philoponus, composed vast commentaries on Aristotle. He employed his Neoplatonic education in defence of Monophysitism. He wrote against both other Christians and the pagan philosophers, particularly Proclus. Thus he provided the first philosophical arguments in favour of Christian cosmology, creation, and the perishability of the physical cosmos.

At Gaza the rhetorician Aeneas, a student of the Alexandrian Neoplatonist Hierocles, founded a Christian school. It promoted the philosophical value of Christianity through (Neo)Platonism. His friend Zacharias, later bishop of Mytilene, converted from Monophysite Christianity to Orthodoxy, and wrote against Ammonius of Hermeias.

The corpus attributed to Dionysius the Areopagite was written in the late 5th century, but gained Orthodox recognition after its defence by John Scythopolis (early 6th century), Maximos the Confessor (7th century), and the Patriarch Germanos (8th century). It is immersed in Proclus' Neoplatonism, at least in terminology, ranging from the tripartite distinctions of essence-power-activity and of participation, to the apophatic theology and theurgy. Nevertheless, it adhered to Christian doctrine, and contained novel formulations.

The so-called Aristotelian renaissance of 7th-century Byzantium was owed to the Neoplatonic integrated curriculum of Plato *and* Aristotle. Maximos the Confessor (saint in both the Greek and Latin Churches) introduced fresh philosophical rigour into Orthodox theology. For this he employed the typical Neoplatonic distinctions, such as intelligible versus sensible created being, essence–power–activity, and remaining–procession–return.

The Neoplatonic elements in Orthodox theology also surfaced in the major controversy over the role of icons. Proclus had written extensively on the modal existence as a principle, thing in itself, and as "image" (*eikon*), and on the relation of "archetype" to "image". Such philosophical concepts helped those who supported the veneration of icons (e.g. John Damascenus) to win the argument, and thus maintain the physical domain, and the means of understanding it, intellect, in divine grace.

Among the prominent Byzantines who wrote on Neoplatonism were Psellos (11th century), George Pachymeres, Nikephoros Blemmydes, and Nikephoros Choumnos (13th to 14th century), Plethon and his student Bessarion (15th century). At the invitation of the Medicis, Bessarion flourished in Italy. The Florentine Academy became the epicentre of western European Renaissance.

Through Neoplatonism, Greek universal learning informed the rise of Arab, Jewish, and European philosophy and theology. In the east, Neoplatonism influenced Islamic (Avicenna, Averroes) and Jewish thought (Gabirol). In the west, Neoplatonism influenced mystics and scholars (often through Porphyry and the commentaries on Aristotle): Boethius, king Alfred the Great, Duns Scotus, Richard St Victor, Anselm of

Canterbury, Abelard, Eriugena, Albertus Magnus, Grosseteste, Aquinas, and John Milton; the Renaissance figures Ficino and Pico, the humanists Sir Thomas More and Ralph Cudworth, and the astronomer Johannes Kepler. In modern literature Neoplatonism inspired William Blake, Samuel Coleridge, Percy Shelley, and W.B. Yeats. In modern philosophy, Neoplatonism influenced Benedict Spinoza, and the Idealists such as George Berkeley, Henri Bergson, Georg Hegel, Francis Bradley, John McTaggart and, in the 20th century, the London University professor F.C. Copleston.

Nero AD 37–68

Roman emperor

Nero (54–68) had a more complex relationship with Greece than any Roman emperor before or after him. Although other men, such as the Egyptian Amasis (Herodotus, 2. 178) and the Roman general Antony (Plutarch, *Antony*, 23), had been called philhellenes, Nero as Roman emperor had unprecedented power to express his love for Greece on a vast scale. Nero's philhellenism can be divided into two categories: first, there is his own personal pursuit of Greek culture, music, and literature; secondly, there is his adoption of a foreign policy that was beneficial to Greece as a country.

Early signs of Nero's love of Hellenic culture are clear from his enthusiasm for the Greek language: under Claudius, he gave speeches in the senate in Greek on behalf of the Rhodians and the Trojans. Some critics have suggested that Nero did not write these speeches himself (cf. Tacitus, *Annals*, 13. 3. 3: Nero was "the first ruler to need borrowed eloquence"). That may be so, but his public demonstration of competence in the Greek language certainly contrasts with previous emperors, such as Tiberius, who could speak Greek fluently, but only ever did so in private. Another early sign of his philhellenism can be seen in his staging of Pyrrhic dances by young Greeks in AD 57 (Suetonius, *Nero*, 12. 2). Yet it was not until after the murder of his mother Agrippina that Nero was able to give full and free expression to his personality. In AD 59 Nero himself performed on the cithara at the Juvenalia, where he celebrated the first shaving of his beard (Suetonius, *Nero*, 11. 1; Tacitus, *Annals*, 14. 15. 1; Dio, 61. 19. 1). Not only Nero but certain Roman aristocrats also appeared on stage, acting dramatic roles. Yet the Juvenalia took place within the palace grounds in private: it was not until AD 64 that the 27-year-old Nero made his debut on the public stage, at Naples (Tacitus, *Annals*, 15. 33–34 and Suetonius, *Nero*, 20. 2–3). Conspicuously, he avoided Rome for this performance, perhaps anticipating a hostile reaction.

Yet his confidence quickly grew. In AD 60 he had instituted a quinquennial contest along Greek lines called the Neronia, in which participants competed for prizes in oratory, singing, playing the lyre, and poetry (Tacitus, *Annals*, 14. 20. 21; Suetonius, *Nero*, 12. 3; Dio, 61. 21. 2). According to the sources, at the second Neronia in AD 65, despite the senate's attempts to dissuade the emperor from performing, Nero recited a poem on stage and then accompanied his singing on the lyre (Tacitus, *Annals*, 16. 4. 5; Suetorius, *Nero*, 21; Dio, 62. 29. 1). If these festivals were designed to inspire fellow Romans with a passion for Greek culture, Nero was unsuccessful. Subsequent historical and literary accounts cast the emperor in a tyrannical light, partly because the spectators at his shows were increasingly obliged to become the focus of attention themselves: either they performed on the stage or their reactions to Nero's display were carefully monitored by imperial agents. Nero's manipulation of his fellow Romans was too overbearing and superficial, rather as when Peter the Great tried to make his fellow Russians more "western" by getting them to shave off their beards.

When Nero died, the pretence of philhellenism that had gripped Rome perished with him. The new Flavian dynasty

bolstered their own power by reversing many of Nero's policies and ideologies. Thus, Vespasian rejected Nero's infamous Golden House as an imperial residence, rehabilitated the colossal golden statue of Nero to represent the sun, and refurbished the temple to the Divine Claudius, which Nero had deliberately neglected. The theatrical philhellene Nero had temporarily redefined the imperial identity, but this proved unpopular with the senate, so the more austere Vespasian wisely took as his role model Augustus rather than Nero. Yet there is evidence that Nero was missed by some. After his death, no fewer than three men appeared, each one falsely claiming to be the emperor. The first surfaced on the island of Cynthus in AD 69 (Tacitus, *Histories*, 2. 8–9), the second in Asia Minor in AD 80 (Dio, 66. 19), and the third among the Parthians in AD 88–89 (Suetonius, *Nero*, 57. 2). Whatever their personal motives, such impostors clearly hoped to win the public approval of those who, long after the emperor's death, "used to lay spring and summer flowers on Nero's grave" (Suetonius, *Nero*, 57). The fact that all three pretenders materialized in the east suggests that Nero's posthumous standing there was much stronger than in the west.

Nero's treatment of Greece itself can be seen as inconsistent. After the fire of Rome in AD 64, the emperor sent agents to Greece to remove treasures (including statues of the gods) from shrines at Athens, Delphi, Olympia, and Thespiae. Pausanias says that Nero "robbed Apollo of five hundred bronze statues, some of gods and some of men" (10. 7. 1). This move may have been necessitated by short-term financial expediency, but it should warn us not to over-romanticize Nero's relationship with Greece. He owes his reputation as a philhellene above all to his liberation of Greece from taxation and Roman administration. This flamboyant emancipation took place at a special celebration of the Isthmian games at Corinth on 28 November AD 67, while Nero was conducting an artistic tour of Greece. By this action he recalled the actions of Titus Flamininus in 196 BC, who had also liberated Greece (Polybius, 18. 46). On a damaged marble stele a version of Nero's speech from this occasion is preserved, together with a decree from Akraiphiai in Boeotia honouring the emperor (*Inscriptiones Latinae Selectae*, edited by Hermann Dessau, 1892, reprinted 1979, no. 8794). Although Nero told his Greek audience that he acted "not out of pity for you but out of goodwill", there are hints in the speech that his action was not entirely altruistic. Nero also boasted proudly that although other leaders had liberated cities, only he had liberated a province. The competitive emperor seems concerned here, not with promoting the well-being of Greece, but with bolstering his own reputation. At one point Nero even wishes paradoxically that Greece were still at its peak so that more people might enjoy his favour. This, surely, is a revealing formulation, which puts into perspective Nero's reputation as a philhellene, as did the fact that he called his Greek games the Neronia, after himself. The Akraiphiai decree shows that in AD 67 there was gratitude in Greece for the liberation, but this may not reflect universal opinion: as Tacitus says in a different context, "Services are welcome as long as it seems possible to repay them, but when they greatly exceed that point they produce not gratitude but hatred" (*Annals*, 4. 18). In any case, Nero died so soon afterwards that no consolidation of the grant was possible. After the civil wars of AD 68–69 the new emperor Vespasian complained that Greece had forgotten how to be free and Nero's gift was swiftly cancelled.

Nero's benefaction had an immediate impact in the short term, as the Akraiphiai decree shows, but did his treatment of Greece make any long-term difference? In some ways, it was a mixed blessing for Greece to have received such a conspicuous benefaction from this disgraced emperor. Even in the Akraiphiai decree Nero's name was deliberately erased from the stele after the senate had condemned the dead emperor to oblivion (*damnatio memoriae*). Nero himself was quickly cast in the literary tradition as a yardstick for monstrosity even by Greek writers, as when Philostratus makes Vespasian say that he would rather have Nero come back to life than surrender the empire to Vitellius (*Vita Apollonii*, 32). Even so, despite the backlash against Nero, there are signs that some Romans began to embrace Greek culture. Juvenal (2nd century AD) included in one satire a xenophobic tirade about Rome being infiltrated by Greek habits (*Satires*, 3. 58–125), and under Trajan (AD 98–117) new senators were recruited from Athens and Sparta, which resulted in significant cultural interaction. During the 2nd and 3rd centuries AD there was a period of cultural renaissance in Greece, which became known as the "Second Sophistic". Some scholars suggest that Nero's short-lived liberation of Greece even provided the spark that caused this intellectual revival. Nero's unsubtle attempts to inculcate philhellenism in his fellow Romans certainly failed, but the theatrical liberation of AD 67 still heralded a remarkable new era of literary creativity in Greece.

RHIANNON ASH

Biography

Born in AD 37, Nero succeeded Claudius as emperor in 54. After the death of his mother Agrippina he felt free to indulge in his love of Greece. He himself sang and performed on stage, and he introduced Greek-style games at Rome (called the Neronia). In 66–67 he toured Greece and liberated the province from Roman administration and taxation. The gift was cancelled soon after his death in 68 but it may have helped to pave the way for the Second Sophistic movement of the 2nd and 3rd centuries.

Nestorius *c.*381–*c.*451

Archbishop of Constantinople

Nestorius was born in Germaniceia in the province of Syria Euphratensis (east Syria) and at an early age entered the monastery of Euprepeia near Antioch. In Antioch he acquired, like John Chrysostom before him, a great reputation as a preacher, strongly influenced by the theological views of Theodore, bishop of Mopsuestia (died 428), and in general by the Antiochene school of theology. Theodore's biblical commentaries used scientific, literary, and historical methods of interpretation that contrasted with the allegorical method favoured by the Alexandrians. This involved an understanding of Christ as subsisting in two complete natures, Godhead and manhood united by will, or, as Theodore expressed it, by "good pleasure", into one intimately related but outward person (*prosopon*). As Nestorius himself was to write towards the end of his life, "The Maker is in every way other than that which is made" (*Bazaar of Heraclides*, p.27). The unity between the *Logos* (Divine Word) and the man, Jesus Christ, was achieved by the *Logos* uniting himself with the human Jesus, a view justified in scripture from Philippians 2: 6–7: Jesus Christ, "being in the form of God, thought it not robbery to be equal with God, but made himself of no reputation and took upon himself the form of a servant and was made in the likeness of men". This voluntary self-emptying of divinity enabled the *Logos* to form a union of wills with Jesus, to become a single personality, share in human experiences, including the cross and death, and so redeem mankind.

This Christology, however, differed fundamentally from that of Alexandria. The Alexandrians stressed the divinity of Jesus Christ as one divine person, as stated in John 1:14: "the Word became flesh and dwelt among us". Godhead and manhood were therefore fused in a unity of essence, a hypostatic union as Cyril of Alexandria would claim, not simply a conjunction (*synapheia*) of wills in one personality.

These contrasting concepts were long-standing and had existed side by side without open conflict through the first quarter of the 5th century. However, on the early death of archbishop Sisinius (426–27) the clergy of Constantinople failed to agree on a successor. The emperor Theodosius II thereupon broke the deadlock by sending for the presbyter Nestorius. The latter's character and lack of judgement created a crisis between the two Christologies.

The Constantinopolitan historian Socrates wrote of Nestorius (*c.*439) that he was "a man of extreme lack of tact, ignorance, and garrulity" (*Historia Ecclesiastica*, 7. 29), qualities he showed in the first days of his episcopate. The Arians, though finally condemned as heretics at the second Ecumenical Council at Constantinople in 381, were still respected in the capital, as were other dissenters, such as the Macedonians and Novatianists. Nestorius deprived the Arians of their chapel within the walls of the city and soon afterwards acted against the Macedonians, Montanists, and Novatians. "Give me, O emperor, the earth purged of heretics, and I will repay you with heaven. Assist me in destroying heretics and I will help you harry the Persians", he had said during his consecration sermon (Socrates, loc. cit.). He was as good as his word. Unfortunately a fire broke out in the city shortly afterwards, which earned Nestorius the title of "firebrand" and alienated the inhabitants from him.

Nestorius had brought a number of Antiochene priests with him. On 24 November one of these, the presbyter Anastasius, preached a sermon in which he attacked the term *Theotokos* ("one who gave birth to God") as applied to the Virgin Mary. Nestorius insisted that Mary was the bearer of Christ and that the proper term was *Christotokos*. Socrates (*Historia Ecclesiastica*, 7. 32) points out that *Theotokos* was not a novelty in the east and could be found in the writings of Eusebius of Caesarea and Origen. Nestorius in his view was simply ignorant. Nestorius' antipathy to *Theotokos* did not go unnoticed by Cyril, archbishop of Alexandria, who had official and unofficial agents in the capital. These kept him quickly, if inaccurately, informed of Nestorius' views and actions. Soon afterwards, early in 429, Pelagian exiles led by Julian, bishop of Eclanum, arrived in Constantinople. Though Nestorius informed pope Celestine (422–32) and requested, somewhat peremptorily, information about them, he did not receive them unfavourably, thus antagonizing the papacy and the powerful North African Church led by Augustine.

For the moment the issue between Nestorius and Cyril was the term *Theotokos*. However, the see of Alexandria had long coveted the primacy over the eastern Churches accorded to Constantinople at the council of 381. Cyril, annoyed by reports sent to him by his agents that Nestorius was making mischief for him with the emperor, wrote urging him to cease his opposition to *Theotokos* (June 429), and implying that Rome might be concerned about Nestorius' doctrine. In the spring of 430 he composed the five-book *Adversus Nestorium* (Against Nestorius) for his monastic and Alexandrian audience. Nestorius, though unpopular in the imperial city, retained the ear of the emperor.

He does not seem to have replied to Cyril's attacks, and early in 430 Cyril tried once more. Again there were

complaints about Nestorius' alleged hostility, but this second Letter to Nestorius contained a full-dress statement of Alexandrian Christology. Cyril stressed the union (*henosis*) of the two natures of Godhead and manhood in the Incarnate Christ's one divine person. Reject this personal union, he argued, and the alternative was two Sons, one divine and the other human, while *Theotokos* followed naturally from the single divine person. For good measure Cyril sent a copy of his letter with a Latin translation to pope Celestine.

Nestorius replied to Cyril in June 430. He pointed out that in the Creed of Nicaea Christ was described as "Lord Jesus Christ", thus indicating his existence in two complete natures in the same person, Christ. Christ suffered and died in his bodily nature, while the divine Word remained as it was, not subject to change or suffering. The body served as "its temple" which God raised "in three days" (cf. John 2: 13). This clarification of doctrine, Nestorius added, coincided with the exceedingly prosperous state of the empire. A copy, but not translated, was sent to Celestine.

Not surprisingly, the pope took Cyril's side. Celestine remembered that Ambrose of Milan had spoken in terms suggesting that Mary was Theotokos. At a council held in Rome in August 430 he condemned Nestorius, ordering him to recant his views within ten days on pain of deposition. He empowered Cyril to see that the sentence was carried out. The emperor, however, still supported Nestorius. A third letter by Cyril in November 430 set out 12 statements regarding the doctrine of the Incarnation to which he demanded Nestorius' assent. "You must declare in writing and on oath that you anathematize your impious tenets and believe what we believe." Some of Cyril's statements verged on Apollinarian heresy, and now opinion in the bishoprics under the jurisdiction of Antioch began to rally to Nestorius. Before Cyril's letter with its 12 anathemas could be delivered to Nestorius, the emperor had decided to summon a General Council at his archbishop's request to meet at Ephesus at Whitsun the following year.

During the following months opinion hardened on each side. Nestorius gained the support of the Syrian bishops, but Cyril was assured of that of Rome and the majority of the bishops in Asia Minor who were jealous of Constantinople's exercise of metropolitan authority over them. He also had the backing of the powerful and ambitious Juvenal, bishop of Jerusalem. In the event, Cyril accompanied by 50 Egyptian bishops arrived at Ephesus early in June 431. His allies, apart from the papal delegates, arrived shortly afterwards. Without waiting for the arrival of John, bishop of Antioch, and the Syrians he opened the council on 22 June. The question at issue was whether his or Nestorius' doctrine accorded best with the Creed of Nicaea, regarded in East and West alike as the touchstone of orthodoxy. Since the crucial statement in the Creed was that Christ was "of one substance with the Father", the odds were stacked heavily in Cyril's favour. Nevertheless he made doubly sure. As Nestorius was to state, the council was Cyril's. "Cyril presided; Cyril was accuser; Cyril was bishop of Rome [i.e. behaved as if he were the pope]; Cyril was judge" (*Bazaar of Heraclides*, p.117). By the evening of the same day Nestorius had been condemned as "the new Judas", deposed from his see, and deprived of ecclesiastical orders. The crowd and Memnon, bishop of Ephesus, shouted in delight.

This was not quite the end. On 26 June John of Antioch arrived at Ephesus with 68 bishops. At once he excommunicated Cyril and Memnon and all the bishops who had accepted Cyril's 12 anathemas. Deadlock was not broken by the arrival of papal legates early in July and their support for Cyril. By August, however, the scene moved to Constantinople. In the complicated negotiations that followed, Nestorius was sacrificed in return for the healing of the breach between Alexandria and Antioch, which took place in 433 through the Formula of Reunion. He returned to his monastery at Antioch. Later (*c.*435) he was removed in exile to the Great Oasis in Upper Egypt where he died, believing that the papacy in the person of pope Leo and the *Tome* he wrote in 449 had vindicated his two-nature theology of the Incarnation. It was there that he composed his long apologia, known as the *Bazaar* [or *Book*] *of Heraclides*.

The "tragedy of Nestorius" will always be debated. On the then current interpretations of John 1: 14 and the Christology of the Council of Nicaea Cyril was in the right. The decision of the Council of Constantinople in 381 that declared Constantinople to be "the new Rome", reserving only the primacy of honour to Rome and the papacy, was unacceptable to him and also to the see of Alexandria. Moreover, Nestorius' lack of tact and statesmanship contributed to his fate. On the other hand, his defence of the full humanity of Christ and interpretaion of the Incarnation in that sense preserved the Church from a purely Platonic understanding of the life and work of the Master. Generations better equipped to consider that event in terms of history will be grateful to Nestorius and his Antiochene allies.

Nestorius' views survived to inspire the majority Church in Persia during the 5th and later centuries. Nestorian missionaries took their faith along the Silk Route to eastern China from the 7th century. In the 14th century the Nestorian Church suffered severely through persecutions by the Muslim Mongols. It survives as the Church of the Assyrian Christians, living in mountainous areas in Kurdistan.

Biography

Born in Syria *c.*381, Nestorius entered the monastery of Euprepeia at Antioch and may have been a pupil of Theodore of Mopsuestia. He gained a reputation as a preacher and was summoned by the emperor Theodosius II. He became archbishop of Constantinople in 428. He incited controversy and was opposed by Cyril of Alexandria and Pope Celestine. Deposed by the Council of Ephesus in 431, he died in exile in Upper Egypt *c.*451.

New Testament

The Greek equivalent of our phrase "New Testament" is *kaine diatheke*, which signified initially the new covenant cemented in Jesus Christ. Since, however, Christians are sons and heirs to God, the *diatheke* is also represented in the apostolic writings as a testament whose provisions were made irrevocable by the death of the testator, God himself (Hebrews 8: 16; Galatians 3: 15). Hence the Latin *novum testamentum* became the title of the book in which the legacy was sealed. Though Clement of Alexandria writing around 200 would appear to have been the first to speak of a body of Christian writings as a *kaine diatheke*, and the description of its contents as a "canon" is even later, there can be little doubt that all the works comprising our New Testament were accepted as authoritative by the end of the 2nd century. By this time, the status of other works that had temporarily enjoyed the same authority was waning, and though the "apocryphal gospels" might continue to be cited, it was always as historical testimonies, not as arbiters in doctrinal controversy. The earliest Greek catalogues of the New Testament date only from the 4th century, but a Latin canon, the Muratorian Fragment, whose contents suggest a date before the end of the 2nd century, is sometimes thought to have been based on a Greek original. Although this text implies that date and provenance were criteria of admission, even ancient witnesses admit that they do not know the author of Hebrews or Revelation, yet accept them on the endorsement of the Church.

The first writings of our New Testament to be called "scripture" (2 Peter 3: 16) are the letters of St Paul, which, where authentic, must have been written before AD 65. The ones most commonly reckoned to be authentic (1 Thessalonians, Galatians, Romans, 1 and 2 Corinthians) are addressed to Gentile Churches that were not yet free from pagan ways of thinking or secure against the Judaizing tendencies that may be represented by the letter ascribed to James. Philippians and Philemon, which are probably genuine works of Paul's imprisonment, accord a new importance to the human Christ as a model of patient suffering and humility. The letters to the Colossians and Ephesians (only one of which is likely to be genuine) issue precepts that are suitable for all churches and supported by a doctrine of election in the pre-existent Christ. The letter to the Hebrews, much of which reads like a commentary on difficulties in other Pauline letters, reflects a time of widespread persecution and apostasy, and may well have been written by a late follower of Paul. Few scholars now accept the Pauline authorship of the pastoral epistles (Titus, 1 and 2 Timothy) which, in extolling the ecclesiastical hierarch as a bulwark against false teaching, savour more of the 2nd century than the 1st. Also 2 Thessalonians appears to be a spurious document, written for a time when persecution had aroused false expectations of the End. Affliction and apostasy also furnish the occasion for 1 and 2 Peter and the letter of Jude; the last two are all but identical in places, and few would now attribute any of the three to their titular authors.

The tendency to emphasize (perhaps even to exaggerate) the diversity of the New Testament is apparent in modern study of the four gospels. Tatian already presumed their canonicity when he compiled his *Diatessaron* around AD 170, and ten years later they were already a fourfold cord of truth to Irenaeus; it is common now, however, to maintain that each was intended for a different audience and originally current in different regions. If we may rely on the Ignatian correspondence, Matthew's gospel was used in the district of Antioch around AD 100. John's, though claimed by Ephesus, is first attested around AD 130 in Egypt; the Rylands papyrus, which tells us this, does not tell us whether the readership was orthodox or Gnostic (if indeed it makes sense to ask). Tradition attributes both texts to apostles, while revering Mark as a disciple of Peter and Luke as a companion of Paul. The evidence for the latter claim is furnished by the Acts of the Apostles, to which Luke's gospel is a preface. Most modern critics, however, doubt that any is the product of an eyewitness, and believe that all of them presuppose the events surrounding the fall of Jerusalem in AD 70. Mark's gospel, the least regarded in the early Church, is now often believed to be the source for the narratives of Luke and Matthew, though the "Griesbach hypothesis" argues that it is rather a digest of them. These "synoptic gospels" are the source of ecclesiology and ethics for the main Churches, while that of John has generally been accepted as a more "spiritual" record, furnishing materials for Christology and Trinitarian dogma. The three letters attributed to John denounce opponents of his teaching as the Antichrist; in Revelation, the only book that claims to be by a man named John, the Antichrist is a human tool of Satan, and his oppression of the saints is prophesied in vivid detail. The authority of this text was doubted even in the 3rd century, both because of its dubious authorship, and because of the unfruitful speculations to which it led.

Greek is the language of the whole New Testament, and probably the first language of all its authors, though in some cases (especially the words ascribed to Jesus in Matthew's gospel) it is tinged with Aramaic idioms. The one Greek book that can be said to have served the canonical authors as a model for style or content is the Septuagint, and although the resulting dialect is often described as the common Greek or koine of the period, it contains a large number of idioms not found in other literary works. Even Luke, who shows some knowledge of Classical conventions, would not have satisfied a contemporary purist. The oldest complete Greek manuscripts of the New Testament, the Codex Vaticanus and Codex Sinaiticus, are dated to the 4th century. Since the Reformation, the recovery and translation of the most primitive texts have preoccupied western scholars; the Greek Church, on the whole, has shown little interest in this enterprise. This is not

because the New Testament plays no part in eastern Christendom; it supplied the only prooftexts for the ecumenical councils, and has always been regarded as a treasury of wisdom by the mystics. In the patristic era, distinguished commentaries on the gospels and the letters of Paul were produced by Origen, Didymus, Theodore, Chrysostom, Cyril, and Theodoret. Theodore, Theodoret, and Chrysostom, the "Antiochenes", even anticipate the modern interest in the historical circumstances of Paul's writing, and therefore tend to interpret him more literally than their western counterparts. Moreover the Greeks, no less than western Christians, rely upon the New Testament to establish the authority and clarify the meaning of the Old. Nevertheless, the New Testament is not, in Greek eyes, the source of Christianity, but a witness to the apostolic teaching that the Orthodox tradition both inherits and upholds.

Niarchos, Stavros 1909–1996

Shipowner

Stavros Niarchos was one of the "Golden Greeks", a group of entrepreneurs (another was his long-standing business rival, Aristotle Onassis) who made vast fortunes for themselves and acquired fame and often notoriety in the international jet set of the post-war world. Niarchos was born in Piraeus in 1909; his parents, originally from the southern Peloponnese, had emigrated to the US, but returned to Greece before Stavros was born. He thus missed the chance to acquire US citizenship.

His family was comfortably off until 1923, when his father went bankrupt; the experience was probably traumatic and Stavros, 14 at the time, is said to have vowed never to be poor again. In 1928 he started work as an office assistant in the flour-milling firm owned by his maternal uncles, the Coumandaros brothers. He managed to persuade them to invest in ships to carry the grain to their mills, resulting in large savings on grain importation costs and bigger profits; he himself then invested in the ships. In the late 1930s he acquired a 60 per cent share and operational control of one of his uncles' ships and started building a shipping company.

At the outbreak of World War II, along with most of the Greek shipowners, he chartered his modest fleet to the Allies. He joined the Greek Navy and at the end of the war he was demobilized with the rank of lieutenant. For three years after the war (1945–47) he was the Greek honorary naval attaché in New York.

Most of his ships did not survive the war, but Niarchos collected considerable sums in insurance, having had the foresight to insure against war risks before the war, when the premiums were still low. With the insurance payments he started to buy and build ships on a large scale, starting with Liberty and Victory bulk carriers and T2 tankers. His business fortunes were helped at different times by sharp rises in freight rates; the Korean War, the Suez crisis, and the Six-Day War all worked in his favour.

Niarchos's success was at least partly based on his talent to analyse and forecast business trends. Both Niarchos and Onassis had foreseen that oil and its transportation were going to be crucial for the world economy. In the 1950s both men pioneered the supertankers: in 1954 Niarchos ordered the largest tanker in the world at the time, the 45,000-tonne *World Glory*. Supertankers proved to be immensely profitable, allowing for the investment to be recouped quickly, sometimes in as few as four voyages. In 1953 Niarchos (along with Onassis) was prosecuted by the US Department of Justice for acquiring ships not intended for US citizens. Though a compromise was

worked out, he transferred his operations to Europe soon afterwards.

Niarchos's early fortune was based on ships. By 1956 he owned more than 50 ships with more than 2 million tonnes' capacity. Ten years later he had 72 ships and another 16 on order. By the late 1970s his fleet had shrunk to fewer than 30 ships. Nevertheless in the early 1980s he still reputedly had one of the largest private tanker fleets, between 4 and 5 million tonnes deadweight. By 1986 this had come down to around 3 million tonnes deadweight, and before his death it had shrunk further to around 1 million tonnes (18 ships), ranking him 15th among Greek shipowners.

However, even if he is known primarily as a shipping magnate, Niarchos diversified early on. In the 1950s he had fought his arch-rival, Onassis, for the franchise of Olympic Airways (and lost); in 1956 he founded the Hellenic Shipyards in Skaramangas, with more than 10,000 employees at one time; and in 1970 he acquired a lucrative oil refinery in Aspropyrgos (both enterprises are near Athens). He also owned stud farms in France and the US as well as racehorses, and real estate all over the world, including a private island, Spetsopoula, 100 km south of Piraeus (bought in 1957; Onassis retaliated by buying the island of Skorpios in the Ionian Sea soon afterwards), the 18th-century Hôtel des Chanalleines (originally a present of Louis XIV to his son, the Duc de Maine), and other real estate in Monte Carlo, St Moritz, Antibes, Normandy, and the Caribbean; he is also believed to have been the largest private investor in Citibank.

His art collections were fabulous. As early as 1958 he had bought the E.G. Robinson art collection, to which he continued adding: reputedly he owned ten Renoirs, six Gauguins, and seven Van Goghs, works by El Greco (including his magnificent *Pietà* of 1585), Rubens, and Goya. By the mid-1980s only 15 per cent of his wealth was in ships, the remaining 85 per cent believed to be invested in art, gems, and gold as well as property and racehorses. This diversification (along with sheer size) cushioned his fortune from the effects of the shipping slump of the 1980s. At the time of his death, *Fortune* magazine ranked Niarchos the 32nd-richest person in the world, with an estimated fortune of more than $5 billion.

Niarchos's lifestyle style was flamboyant – to the point of vulgarity, some said; and though he was more private than his arch-rival Onassis, he was nonetheless a legendary spender, lavishing hospitality to guests. In the 1950s it was said he was attending or giving five or more parties a week, some on his luxurious yachts or his private island.

His personal life was turbulent. Two marriages, in 1930 and 1939, lasted one and six years respectively. In 1947 Niarchos married Evgenia Livanou, daughter of Stavros Livanos, himself a Greek shipowner. A year earlier Onassis had married Tina Livanou, the younger of the two sisters, so the two men became brothers-in-law; this did nothing to diminish their business rivalry. Niarchos's marriage to Evgenia proved the longest-lasting of his five marriages: they had four children. They separated in 1964 when Niarchos married Charlotte Ford (daughter of Henry Ford II); they had a daughter, Elena (whom he never formally recognized) but the marriage was declared invalid since Niarchos's marriage to Evgenia had not been formally dissolved in Greece. In 1967 his marriage to Charlotte Ford was dissolved and he returned to Evgenia. She died in Spetsopoula in 1970 in rather mysterious circumstances, from a sleeping-pill overdose (though the post-mortem also showed signs of physical abuse). Niarchos was charged with murder but the charges were later dropped. Nevertheless he left Greece soon after. In 1971 Niarchos married Tina Onassis, former wife of his business rival and formerly his own sister-in law; some said he did it to spite Onassis. Tina died in Paris in 1974. Niarchos never remarried, though he allegedly had a series of affairs, including, it is rumoured, one with Pamela Harriman, the former wife of Winston Churchill's son, Randolph.

In 1991 Niarchos underwent back surgery, which made it difficult for him to walk. His last years were spent in isolation, in a sterilized room in his villa in St Moritz, from which he communicated by microphone with his family and visitors. He died in Zurich on 15 April 1996. Throughout his life Niarchos would say: "'I am Greek and I feel Greek." He proved his affection for his homeland in his will. His legendary fortune was split between the four children from his marriage with Evgenia and the Stavros Niarchos Foundation, a non-profit body financing charitable projects, many in Greece.

Biography

Born in Piraeus in 1909 to a well-off family, Niarchos was 14 when his father was bankrupted. Joining the family flour-milling business in 1928, he persuaded his uncles to invest in ships and in the late 1930s he himself started a shipping company. His pioneering of oil tankers in the 1950s was particularly successful and his wealth became legendary. He died in Switzerland in 1996.

Nicaea

City in northwest Asia Minor

Nicaea (modern Iznik) is strategically located on main highways at the edge of a lake in northwest Asia Minor, a day's journey from Constantinople. A centre of Hellenism in the Hellenistic, Roman, and Byzantine periods, it played a major role in the history of the Christian Church.

Established originally by Antigonus I, Nicaea was refounded around 300 BC by Lysimachus who named it after his wife. From 281 to 74 BC it was one of the centres of the kingdom of Bithynia. Under the Romans, Nicaea controlled a vast territory, and struck an extensive and varied coinage. It was built on a rectangular plan and adorned with numerous

Nicaea: view of the Lefke Gate which according to an inscription was dedicated to Hadrian in AD 123

public buildings, some of them on an extravagant scale that attracted unfavourable comment from Pliny, who governed the region from AD 110 to 112. Few monuments have survived from these peaceful centuries. The troubles of the 3rd century, however, produced powerful surviving fortifications that allowed Nicaea to resist all attacks for a thousand years.

Nicaea was an early centre of Christianity (a late tradition has its church founded by St Andrew) and home of several saints and martyrs. In 325 the first Ecumenical Council met there. The emperor Constantine presided over the gathering of 318 bishops who defined orthodox doctrine against the Arians, producing the creed that is still recited. During late antiquity Nicaea flourished as an administrative centre, but suffered from devastating earthquakes and the growth of nearby Constantinople. Several of its buildings were restored by the emperor Justinian in the 6th century.

In the 8th and 9th centuries Nicaea was a major bastion against the Arabs, protecting the approaches to Constantinople and successfully resisting capture. It was headquarters of the Opsikian theme, the military province closest to the capital, and thus seat of a general, garrison, and civil administration. In 787 the city gained further renown as the site of the seventh Ecumenical Council, at which Orthodoxy was restored after a long period of Iconoclasm. In the prosperous centuries that followed, Nicaea remained an important regional centre, home of churches and monasteries, and withstood foreign and domestic enemies. Nevertheless, it fell into the hands of the Turks in 1081 and became the centre of their first state in Asia Minor. The First Crusade recaptured the city in 1097 after a memorable siege, and returned it to Byzantine rule.

The greatest age for Nicaea was the 13th century, when for a moment it was capital of the Byzantine empire. After the capture of Constantinople by the crusaders in 1204, the new emperor Theodore Laskaris (1205–22) took up residence in Nicaea, where he was joined by numerous refugees including leaders of the aristocracy and the Church. Its powerful walls and strategic site made it a suitable capital for the exiled empire, and a valuable base for repelling the attacks of the Latins of Constantinople, the Seljuk Turks, and breakaway Greek states. With the election of a new patriarch in 1208, Nicaea became the spiritual capital of the Orthodox Church. As such, it was the site of synods and negotiations with the Catholics. The Nicene empire reached its height under John Vatatzes (1222–54) who usually resided in the southern part of his domains, but still devoted much attention to Nicaea. The patriarchate was richly endowed as the state expanded and prospered. The city also became an important centre of learning: leading scholars of the day studied and taught there, and an imperial school provided education in rhetoric and poetics.

The most noteworthy products of this revival are two elaborate speeches of the 13th century in praise of Nicaea.

The recapture of Constantinople in 1261 introduced a period of rapid decline as the patronage of Church and state was removed. As imperial attention shifted to the west, Asia Minor was rapidly lost. By the early 14th century Nicaea was one of a few walled cities holding out against the Turks. After a long blockade it finally succumbed in 1331. By then it was virtually deserted.

Although the first century of Ottoman rule brought considerable recovery, the Christian community dwindled away rapidly; by 1381 it no longer had the resources to support a bishop. During the next five centuries only a handful of Christians remained in the constantly declining town. By the end of the 19th century they were using Turkish in their liturgy. Hellenism finally came to an end in 1921, when the last standing church was despoiled.

The most impressive remains of Nicaea's glorious past are the fortifications. A product of the late 3rd century, they were extensively rebuilt by Leo III (716–41) after a major Arab attack, and by Michael III (842–68) who used Nicaea as a base for his advances to the east. An earthquake of 1065 provoked further repairs, but it remained for the Laskarids to execute the greatest rebuilding. Theodore I added several powerful towers, while John Vatatzes doubled the circuit by the addition of a low outer wall. Distinctive styles of construction reflect a thousand years of the city's history.

The only excavation has been in the Roman theatre, the remains of which reveal the state of Byzantine Nicaea: during the whole period the theatre was abandoned and used as a quarry for restoring the walls, and as a dump. Much of the area within the walls was in fact empty after the 6th century.

Although the palace where the first Council was held has long since disappeared, the site of the seventh still stands. The church of St Sophia, converted into a mosque soon after the Ottoman conquest, was built in the 5th or 6th century, rebuilt in the 9th and 11th, and expanded by Vatatzes. The church of the Dormition (originally the monastery of Hyacinth) had the longest continuous history. A product of the 6th or 7th century, it was richly decorated with mosaics (which show an iconoclastic period) and cut marble. It appears to have been the cathedral during the empire of Nicaea. Several other churches, mostly of the Laskarid period, are attested by texts and remains.

CLIVE FOSS

Summary

A city in northwestern Asia Minor, Nicaea was a major Greek centre in the Hellenistic, Roman, and Byzantine periods. It was also an early centre of Christianity, the seat of the First and Seventh Ecumenical Councils. It flourished in the 13th century as the capital of the Byzantine empire in exile. It preserves massive fortifications and the remains of churches.

Nicander

Poet of the (?)2nd century BC

Nicander of Colophon, a Hellenistic poet of disputed date (probably 2nd century BC), wrote at least 20 works, most in dactylic hexameters or elegiac couplets. Like other erudite Hellenistic poets, he also wrote works of a lexicographic and linguistic nature in prose. A "metaphrast", he converted the prose treatises of earlier writers into epic verse, even when he had no expert knowledge of the subject. Only his *Theriaca* (958 hexameters on poisonous creatures and on antidotes for their bites and stings) and *Alexipharmaca* (630 hexameters on antidotes to poisons) are extant. Among his more influential lost poems are *Georgics* and *Melissourgika* [Bee Keeping], both of which were used by Virgil in his *Georgics*, and *Heteroioumena* [Metamorphoses], which directly or indirectly provided Ovid and Antoninus Liberalis with material for their *Metamorphoses*. Fragments of other poems, for example on geography and local history, are extant, but of many attested works (such as Nicander's rendering in epic verse of the Hippocratic treatise *Prognostic*) there is almost no trace.

The poem *Theriaca* is probably an adaptation of the prose work *On Wild Animals* by an early 3rd-century BC expert on poisons, Apollodorus. Both *Theriaca* and *Alexipharmaca* also discuss the effects of plants on the human body, and for this Nicander likewise appears to have been indebted to Apollodorus, who in turn might have used Diocles of Carystus' work *Rhizotomikon* [Root-Cutting].

The ostensible aim of *Theriaca* is to help those suffering from the stings and bites of snakes, lizards, tortoises, turtles, frogs, toads, fish, scorpions, spiders, bees, wasps, beetles, moths, and flies. Like other Hellenistic scholar-poets, Nicander in fact strives to amaze his readers with a dazzling display of technical virtuosity in the poetic representation of a recalcitrant, unpoetic subject. Seemingly disparate, incompatible elements – archaic epic diction (including numerous Homeric hapax legomena), bold neologisms, technical zoological terminology, epic verse, botany, medical prescriptions ostensibly addressed to a physician, and learned allusions to earlier poetry (especially to Callimachus) – are skilfully woven into a recondite, affectively rich poem.

Exploiting the tensions between his science and his poetry, between his subject and his presentation thereof, Nicander in *Theriaca* describes the poisonous aggressors and their poisoned victims in such a way as to convey his predecessors' "objective" zoological, botanical, and medical expertise, while also using striking metaphors, similes, and aetiological myths to evoke the physical peril, the aesthetic revulsion, and the fright and terror to which the victims are exposed. The tension between science and poetry, which is also reflected in many lexical, semantic, metrical, and syntactic strains in Nicander's language, is thus cleverly translated into a suggestive tension between the victim as scientific object and as terrorized subject in need of the poet's aid.

Further evidence of the poet's aspiration to display technical virtuosity is the insertion of an "epic" catalogue of 82 plants (*Theriaca*, 837–914) in the concluding section on general remedies – plants whose "clinical" applications are not specified – and the covert integration of an acrostic signature of

Nicander's own name (*Theriaca*, 345–53) in a purple passage on the burning thirst caused by the bite of a smallish viper, the dipsas. *Theriaca* ends not only with another reminder of the poet's name and of his birthplace (Clarus, near Colophon), but also with a bold attempt to assimilate Nicander's didactic metaphrasis to Homeric epic: "And now you should hereafter preserve the memory of Homeric Nicander, too, whom the snow-white town of Clarus nurtured" (*Theriaca*, 957–58).

Nicander's hexametric poem *Alexipharmaca* exhibits many of the same characteristics as his *Theriaca*. After a proem addressed to Protagoras of Cyzicus, it presents 22 substances and entities – animal, vegetable, and mineral – that are fatal or harmful to human beings. Some of the more notorious toxic substances known to antiquity are included: hemlock, aconite, opium, henbane, and blister beetle. In each case, the poet first describes the symptoms produced by the poison, and then the antidotes. The poem ends with a *sphragis* (authorial "seal") very similar to the one in *Theriaca*: "And now you should hereafter preserve the memory of Nicander, composer of songs, and guard the law of Zeus, protector of guest-friendships" (*Alexipharmaca*, 629–30). In both extant "seals" Nicander therefore presents a poetic, not a scientific self-understanding ("Homeric Nicander", "composer of songs"), signalling that his poetic identity is a key to understanding his extant works.

Nicander's influence on later Greek and Latin literature was considerable. Not only did Virgil, Ovid, and Antoninus Liberalis draw on his works (see above), but Lucan, Pliny the Elder, Erotian, Aelian, and Athenaeus of Naucratis also benefited from direct or indirect familiarity with Nicander. In the 1st century BC the enormously learned scholar Didymus ("Chalcenterus") appears to have made extensive use of Nicander's lexicographic contributions. Although Dioscurides only twice cites Nicander's views in his *Materia Medica* (3. 29, 4. 99), Galen in his pharmacological works quotes a number of verse passages from Nicander. Papyrus fragments from the 1st to 3rd centuries AD further confirm Nicander's popularity in the Roman empire.

An invaluable corpus of ancient scholia became attached to Nicander's two extant poems. The extant scholia not only explain many of Nicander's words, expressions, and references but also report extensively on the views of Hellenistic authors whose works are lost, including three of the six attested ancient commentators on Nicander. Furthermore, the scholia offer rich data on folk traditions, including superstitions concerning spiders, snakes, toads, frogs, wasps, and salamanders.

Extant Greek paraphrases of *Theriaca* and *Alexipharmaca* were composed by Eutecnius some time after the 2nd century AD. They are included in one of the most famous Byzantine scientific manuscripts, the illuminated "Vienna Dioscurides" (Vienna, Österreichische Nationalbibliothek) produced in Constantinople in AD 512–13. Eutecnius' prose versions here are accompanied by magnificent illustrations of snakes, insects, spiders, scorpions, and other animals. These illustrations also appear in a 10th-century copy of the "Vienna Dioscurides" (now in the Pierpont Morgan Library, New York). In the 10th century a remarkable illuminated manuscript of Nicander's two poems was produced (Paris, Bibliothèque Nationale, Suppl. gr. 247). It contains images not only of the snakes, scorpions, plants, etc. mentioned by Nicander, but also of human figures displaying the effects of the poisonous substances or illustrating Nicander's mythological allusions. In the 13th century Maximos Planudes also showed a keen interest in Nicander, producing a manuscript (Florence, Biblioteca Medicea-Laurenziana) that contained both poems.

The scholia, paraphrases, and illustrations are further evidence not only of the interest that Nicander continued to stir among the later ancient and Byzantine cultural elite but also of their fascination with the amalgam of science, folklore, myth, poetry, and magic that is characteristic of much of the ancient Greek toxicological tradition. This fascination continued to a striking degree in the 16th century, during which many printed editions, several translations into Latin, including one in epic verse, and a verse translation into French were published. A critical appreciation of Nicander's technical virtuosity was widely shared in the early modern period.

HEINRICH VON STADEN

Biography

Born at Clarus near Colophon probably in the 2nd century BC, Nicander wrote at least 20 works, of which two survive: *Theriaca* on poisonous creatures, with remedies against their stings and bites, and *Alexipharmaca* on antidotes to poisons. Both are indebted to Apollodorus. They mix superstition with botany and medicine. Lost works include poems on geography, local history, and medicine.

Nicopolis

City in Epirus

Situated on the isthmus of the Preveza peninsula 6 km north of Preveza, which is itself at the entrance to the Ambracian Gulf opposite Actium, Nicopolis was founded by Octavian on the site of his army encampment during his campaign against Mark Antony in 31 BC. From the outset it operated as an administrative centre serving the cities of northern Epirus. Self-consciously Greek, it never accepted (unlike Corinth) the status of a Roman *colonia*. Its pride in its status is instanced by Epictetus, who lived there at the end of the 1st century AD (*Dissertationes*, 4. 1. 14), and confirmed by its coinage that continued to be minted until the reign of Gallienus (AD 253–68). During its early years, in the reign of Augustus, it had been chosen as the site of the Actian Games, celebrated every four years and given equal status with the major Panhellenic games.

Christianity came early to Nicopolis. Paul asks Titus to come to him there for he "had determined there to winter" (Titus 3: 12) at an unknown date, depending on the chronology of Paul's last years. There was a well-organized community in the city in the early 3rd century AD, for Origen visited Nicopolis *c.*220 and found a copy of the scriptures there, which he used as an authority in compiling the *Hexapla* (Eusebius, *Historia Ecclesiastica*, 6. 16. 2). In the 4th century Nicopolis achieved metropolitan status and, as elsewhere in the Hellenic world, Christianity gradually became the predominant religion in the city. Two large basilicas dating from the early 6th century have been discovered and excavated. One, built by bishop Alkison (died *c.*515) within the city's walls, measured 68.90 by 31.60m; the other, built by bishop Dunetios, had excellently preserved mosaics. The site of the metropolitan's palace was found near Alkison's basilica.

Nicopolis's ecclesiastical pre-eminence was matched by its civil position as the capital city of Epirus under Diocletian's reconstruction of the imperial provinces. It remained an important city in the 4th and 5th centuries and survived seizure by Gaiseric's Vandal fleet and army in 475. It was at the height of its prosperity as a Christian metropolis during the early part of the 6th century, but it became involved in the wars between the Byzantines and Goths for the control of Italy, the Gothic leader Totila laying its surrounding territory waste in 551. Nicopolis seems to have survived the Slav invasions better than most Byzantine cities in the Balkans, for it was still worth contesting between the Byzantines and Bulgars in the 10th and 11th centuries. Final decline did not set in until control fell to the Bulgars in 1040. More recently Nicopolis was the site of a signal Greek victory over the Ottomans in 1912.

WILLIAM H.C. FREND

Summary

A city in Epirus, Nicopolis was founded by Octavian in 31 BC. As Augustus, he chose it as the site of the Actian Games. Under Diocletian it became the capital city of Epirus. It survived the Slav invasions but declined after falling to the Bulgars in 1040. It was the site of a major victory over the Ottomans in 1912.

Nomokanon

Compilation of secular and sacred law

Nomokanon comes from the Greek words *nomos*, meaning "law", and *kanon*, meaning "rule" or "measure" (*kanon* is the Greek word for a measuring stick or ruler). The word, appearing first in the 11th century, referred to collections or compilations consisting of both sacred and secular laws relevant to Church government; hence, *nomos* – referring to secular law – and *kanon* – referring to sacred law. Justification for mixing civil and sacred law in a canonical list included the important role that civil leaders played in securing the physical protection, political well-being, and ecclesial practice of the Church. (It should be kept in mind that lists of secular laws included sacred law as well.)

Perhaps the most difficult obstacle facing the early Church was lack of cohesiveness. In the first three centuries at least, it lacked substantial political, doctrinal, legislative, and liturgical unity. Constantine established a political stability that made subsequent institutional ordering possible. That ordering, or at least the foundation of subsequent ordering, included theological and doctrinal development, the establishment of codes of conduct for Church officers, and the development of a juridical system to oversee and regulate the Church.

The numerous legislative and regulatory questions facing the early Church included proper liturgical practice, requirements for admission to the Church, relations among Churches and Church officers – Church organization – relations between Church law and secular law, the proper disposition of heretics, enforcement of Church regulations, etc. On many such questions the New Testament writers were silent, though clearly their writings put forward standards of moral action. In response to this need for guidelines there arose various declarations of Church law – canon law – giving directions on such problems. These declarations were gradually committed to writing. The sources for these written declarations included: (1) alleged writings of the apostles, e.g. *Apostolic Constitutions*; (2) common practice or custom; (3) formal councils, both parochial (e.g. Sardica) and ecumenical, foremost of which was Nicaea; (4) civil laws and collections of civil laws such as the *Codex Justinianus*; (5) doctrinal and regulatory declarations made by certain of the Church Fathers (the epistles of Basil were important in the East), the pope, and other high ecclesial officers – such decisions are called "decretals". A brief history of canonical collections will clarify the concept of *nomokanon*, which is, after all, a species of canonical collection.

The growth of Church government was gradual but steady. Given their relative circumstances, local Churches formulated unwritten rules of conduct and Church procedure based upon the limited directions available in scripture as well as certain other texts such as the *Apostolic Constitutions* (*c.*380), an eclectic book of instruction and directions allegedly written by the apostles. This text has appended to it 85 apostolic canons of which a substantial number deal, like many other early canonical material, with clerical behaviour.

A group of proximate local Churches would often hold formal regional councils in which to harmonize their practices and procedures as well as deal with regional issues, such as how to adjudicate disputes between bishops or how to deal with lapsed clerics. Such conciliar resolutions were called "canons" or rules of conduct and government. Important examples of such parochial councils include Ancyra (314), Neo-Caesarea (315), and Antioch (341). These councils issued lists of their resolutions and decrees. Canon 1 of Ancyra, for example, forbids presbyters and deacons who have observed pagan sacrifice from returning to their priestly functions. Canon 18 deals with rogue bishops who engage in sedition or disruptive behaviour in another Church's region.

Ecumenical councils, councils to which all or nearly all bishops were invited, met for similar reasons as regional councils and also issued canons. Their resolutions often incorporated all or part of the regional canons while adding to them depending on the nature and scope of issues before them. The Council of Chalcedon (451), for example, refers to the *corpus canonum* – a body of canons – which developed over previous years as more and more regional councils issued their canonical lists. Ecumenical councils would incorporate material from earlier lists and, like the regional councils, would incorporate decretals, instructions given by the Church Fathers. Of particular decretal importance were the 96 canons of Basil the Great. Also important were the canons of certain archbishops such as Dionysius, Peter, Athanasius, Timothy, Theophilus, all archbishops of Alexandria, and the Cappadocian theologians Gregory of Nyssa – brother to Basil the Great – and Gregory the Theologian.

The first seven ecumenical councils, Nicaea particularly, acquired an authority and standing such that their canons served as a kind of metacanon for all other councils. So St Augustine of Hippo, at the regional Council of Carthage (419), insisted that a particular resolution should not contradict the Nicaean canons. Ecumenical councils, while deciding doctrine, therefore, incorporated other lists of canons in their own resolutions.

As the number of canonical lists grew, there were efforts to compile and catalogue them. Thus, at Antioch, in the late 4th century, there arose a *syntagma canonum* containing the resolutions of the earliest regional councils, Ancyra, Neo-Caesarea, Gangra, Antioch, and Laodicea. This list is the *corpus canonum* referred to at Chalcedon. Subsequent compilers add to this list the ecumenical councils of Nicaea, Constantinople I, and Chalcedon (451). As Munier points out, the foundation of canon law consists of this *syntagma* along with 6th-century additions: the canon of Ephesus (431), the 133 canons of the Council of Carthage (419), and the Council of Sardica (343).

The number, growth, and intramural inconsistencies of canonical collections led to the Council *in Trullo* (Constantinople 692), which canonized the canonical collections, so to speak, by establishing one approved list of canonical collections (Canon 2). The list included the decretals of the Church Fathers, the 85 apostolic canons from the *Apostolic Constitutions*, the *syntagma* of Antioch, the canons of Constantinople (394), and the 102 canons of the council itself.

Roughly simultaneous to and paralleling the growth of canonical lists, the emperors Theodosius and later Justinian had compilers gathering secular law, largely in an effort to establish a single, harmonious set of laws to be observed by the entire empire. Theodosius and Justinian wished to replace early compilations such as the *Codex Gregorianus*, a collection of laws issued between 196 and 295. Early lists were inconsistent with each other and contained irrelevant and obsolete material. The *Codex Theodosianus* (438), named after Theodosius II who commissioned it, was a collection of all the imperial constitutions published since the time of Constantine I. The compilation included commentary and relevant material from other jurists and became the legal code for the entire Roman empire. It was superseded by another compilation: the important *Corpus Juris Civilis*, a compilation of secular laws arranged according to topic. The corpus included four other compilations, the *Codex Justinianus*, a collection of imperial constitutions from Hadrian to Justinian I, the *Digest*, *Institutes*, and *Novels*. This work, like the previous collections, included material relevant to ecclesiastical problems and controversies including numerous ecclesiastical regulations. Basil I began yet another collection (finished by Leo VI, 888) intended to incorporate but modernize previous collections. Named the *Basilika*, "imperial laws", it contained much edited material from the *Corpus Juris Civilis* and its compendia, and, like previous collections, the civil laws contained much material governing Church action. The concept of *nomokanon* refers, most precisely, to the practice of combining materials from lists of canon law as well as civil law. Such intermixing of kinds began as early as the 4th century as the emperors directly involved themselves in the conciliar resolutions. Of such nomokanonical lists there are two that are most noteworthy: *Nomokanon of Fourteen Titles* (630) and *Nomokanon of Fifty Titles* (*c.*570). The *Nomokanon of Fourteen Titles* was the most important source of canon law for the Eastern Church, much of which was incorporated into other collections of canons. It was compiled during the rule of the emperor Herakleios (7th century) as a chronological list of canons. Subsequent editions that incorporate additional canonical legislation appear in the late 9th (by Photios?), 11th (by Theodore Bestes), and 12th (by Theodore Balsamon) centuries. Theodore Balsamon includes a commentary. Among the sources of civil laws incorporated into the work is the *Corpus Juris Civilis*.

Another important canonist in the East was John III Scholastikos, patriarch of Constantinople (565–77), who composed the *Nomokanon of Fifty Titles*, which introduced a more efficient cataloguing system over previous lists; i.e. John arranged canons by topic rather than chronological sequence. This work included all 85 apostolic canons and 67 fragments from the epistles of Basil, and other conciliar resolutions.

Rome also had its *nomokanons* and nomokanonists. The most important compiler in Rome was a monk named Dionysius Exiguus who compiled, in the mid-6th century, a

number of canonical lists remarkable for their breadth. His book of decretals, the *Liber Decretorum*, and his compilation of eastern, North African, and Roman lists, the *Liber Canonum*, which included 20 resolutions of Sardica (343), 138 canons of Carthage (419), 50 apostolic canons, and resolutions from 8 eastern councils (Nicaea, Ancyra, Neo-Caesarea, Gangra, Antioch, Laodicea, Constantinople, and Chalcedon) together formed the *Dionysiana* given by pope Hadrian I to Charlemagne in 774 as a basis for legislative and juridical conduct.

Efforts to harmonize and eliminate irrelevant canons were undertaken by Theodore Balsamon, patriarch of Antioch, who wrote a commentary on the *Nomokanon of Fourteen Titles* and by Matthew Blastera (died 1346), a monk living in Thessalonica.

Nonnus

Epic poet of the 5th century AD

Although Nonnus was born in Panopolis, he most probably lived in Alexandria, and travelled extensively in the eastern part of the empire, particularly Asia Minor and Constantinople. He wrote an epic poem of approximately 25,000 lines with the title *Dionysiaca*. As the title suggests, it is about Dionysus, dealing particularly with the subject of Dionysus in India (books 13–40). There was a fascination with Dionysiac themes in both art and literature in late antiquity and Nonnus was not the first to deal with this topic: Euphorion and Dinarchus from Delos were his predecessors in the choice of Dionysiac themes in poetry.

His work stands on the borderline between the ancient and the Byzantine worlds. There is an apparent imitation of Homeric forms, although the metrical similarity is strictly technical. The decision to write an epic poem would almost inevitably put an author in competition with the Homeric poems. Nonnus uses Homeric vocabulary, although as a student of Hellenistic poetry he transforms it into more sophisticated usage. He is inspired by Homeric narrative techniques as well as the epic heroic atmosphere, which he tries to recreate in his own work. Passages such as the two proems, the weaving of Aphrodite in book 24, the shield of Dionysus in book 25, the theomachy in book 36, the various extensive catalogues (books 13, 14, and 26), as well as the presentation of the gods bear witness to both a structural and a more substantial inheritance from Homer. Nonnus was also influenced by Hellenistic poetry. There are many parallels with some love epigrams of the *Greek Anthology*. His use of *propemptika* (dirges) and erotic narrative, as well as his erudite concern with aetiological stories and pastoral motifs, place him in the literary tradition of the Alexandrian school. The pastoral mode is only too evident in the episodes of Actaeon and Ampelus, and Hymnus and Nicaea.

The context of the *Dionysiaca* is inspired by Alexander's expedition to India, the "new Dionysus". This gives Nonnus the opportunity to present an accumulation of various legends and fables on the Dionysiac tradition, with the defect of creating a heavily erudite style, as many scholars argue. Such condemnations, however, do not take into consideration the literary tradition that Nonnus had inherited and the transition in the literary tradition that took place at this very time, with the result that even recent scholarship lacks appreciation of late antique poetry. The historical element that is inserted in an epic context reshapes the poetic ideals of the epic. On the other hand, a rigorous rhetorical tradition has been established and plays an important role in contemporary literary products. There is also a significant debate as to whether there are intertextual allusions to Latin poetry, particularly Ovid and Virgil, which has not yet reached a conclusion. His choice of fusing Dionysian motifs with Alexandrian legends could be appropriated by the emperors who campaigned in the east, revealing also that literature is not alien to contemporary politics, and has a cultural, historical, and even political context.

A major innovation is Nonnus' choice to make Dionysus the central hero of an epic that clearly is indebted to the Homeric epics, even though Dionysus is almost absent in Homer. There was a rich literary and artistic tradition associated with the figure of Dionysus that Nonnus exploited. Dionysus, the wandering god, who transformed himself from youth to old man and vice versa, enjoyed an immense popularity and proved to be the other side of the coin to the Alexandrian theme. Dionysus had a particular appeal to contemporary ideological tensions, for both pagans and Christians. According to Eusebius, Dionysus played an important role in soteriological hagiography, since he appeared from antiquity as a god offering salvation. John Malalas, a historian of the 6th century AD, argued that Dionysus was a mortal, stating that his tomb could be found at Delphi. Glen Bowersock (in Hopkinson) writes that the parallel between Christ and Dionysus was responsible for producing the semi-theatrical work *Christos Paschon* [Christ Suffering], in which Christ replaces Dionysus in a verse borrowed from Euripides, an identification that lies, according to Eusebius and Malalas, at the heart of the Nonnian epic.

Nonnus is also believed to be the author of a paraphrase in epic hexameters of St John's gospel, with the title *Metabole of*

John's Holy Gospel. This is not a simple paraphrase of the gospel, and it renders the personality of Nonnus even more complicated. Some scholars have argued against Nonnian authorship of this work, adducing mostly stylistic arguments. Although the Christian religion had long been established in the Roman empire, the polarities of paganism and Christianity still existed. Some scholars have argued that it is due to Nonnus' conversion to Christianity that the *Dionysiaca* was left unfinished; others say that the domination of pagan motifs was not as unacceptable as we may think for a Christian poet, and place Nonnus' conversion much earlier, if it ever happened.

Biography

Born in Panopolis in Egypt in the first half of the 5th century AD, Nonnus probably lived in Alexandria and travelled widely in the eastern empire. He was the author of an epic poem entitled *Dionysiaca* in 48 books which deals particularly with Dionysus in India. He is also credited with a poetic paraphrase of St John's gospel.

Normans

The Normans were former Vikings who had settled in Normandy under Rollo in 911 and had become Frenchified. It is said that they were great assimilators who, once established, aped the manners of their neighbours, perhaps as a form of self-improvement, doing so in Normandy, England, southern Italy, Sicily, Antioch, and Edessa. The Byzantines themselves employed the Normans as mercenaries, as did most of the other kingdoms of Europe.

It seems likely that it was its reputation as a land of milk and honey that first attracted the Normans to southern Italy. The Norman kingdom that was established in 1130 was regarded as one of the strongest and wealthiest monarchies in western Europe, yet there never was a Norman masterplan for its creation: it emerged as events took their course. At all times the Normans were a tiny minority in Italy, far fewer in number than their fellows who had invaded England in 1066.

The first definite reference to Normans being employed as mercenaries by the Lombard nobility of southern Italy is in 1017. The year 1030 was something of a landmark too when Rainulf le Tonnelier (Ralph the Cooper) was granted land at Aversa by Sergius IV, duke of Naples. Around 1035 Drogo, Humphrey, and William from the impoverished Norman family of Hauteville arrived and entered the service of Gaimar of Salerno. In the years 1038–40 Byzantine forces campaigned against the Muslims of Sicily assisted by Gaimar and Norman mercenaries. The Lombards, backed by the Normans, rose in revolt against the overbearing conduct of the Byzantine general George Maniakes. It was not until the last stages of the rebellion in 1042 that the Normans began to take advantage of the situation. Up to 1040 they had seemed content to remain mercenaries. During the next century they established their hold over southern Italy and Sicily, capturing Messina (1061), Bari, the last Byzantine base in Italy (1071), Palermo (1072), and Syracuse (1085).

In 1046 Robert de Hauteville (Guiscard) arrived to join his half-brothers Drogo and Humphrey. In 1057 he succeeded them as count of Aversa. The most famous of the Norman adventurers, he was in many ways an appalling man who had gained his by-name from his stratagems but one who became a national hero and was placed by Dante in Paradise. Just as Guiscard (d. 1085) was not interested in his lands *per se* but went on to ever further conquests, so his brother Roger (d. 1101), who joined him in 1058, seems to have been a man of genuine political ability who held Sicily as a fief from his brother.

The Normans were hated in Italy and not surprisingly neither the western nor the eastern emperors would recognize their conquests. Their initial reception by the popes had been hostile too; in 1053 Leo IX had led an army against them which they had defeated at Civitate. Yet in 1059 there was something of a reconciliation when the pope recognized Guiscard as duke of the yet unconquered Sicily, seeing in the Normans a strong power to the south of Rome that might be used to counterbalance a strong imperial presence in northern Italy. Friction between pope Gregory VII (1072–85) and Guiscard troubled relations between the monasteries of southern Italy and their would-be Norman patrons. Following the reconciliation of Gregory and Guiscard at Ceprano in June 1080, lavish grants were made by Guiscard and his second wife to Montecassino and other monasteries; their example was followed by lesser Normans in southern Italy. In 1084 it was the Normans who rescued Gregory VII from Rome and the clutches of the German king and Holy Roman emperor Henry IV (1050–1106) and his antipope Wibert (Clement III), but with appalling bloodshed and destruction. Gregory spent the last year of his life under Norman protection at Salerno.

There was little response among the Norman rulers of southern Italy to Urban II's call for a crusade in 1095. Only Bohemond, prince of Taranto, left in 1096. On Guiscard's death in 1085 he had been passed over as ruler of southern Italy in favour of his half-brother Roger Borsa (d. 1111) and he seemed to have no future in the south. In 1098 he became prince of Antioch.

It was Guiscard's nephew Roger II (died 1154) who became count of Sicily in 1105, and it was he who united the Norman

territories in southern Italy. First he was recognized as heir to Guiscard's mainland territories by pope Honorius II in 1128 and one year later he secured recognition as suzerain by Robert II of Capua. In 1130 he took advantage of a papal schism between Innocent II and Anacletus II to secure a royal coronation from the latter who was desperate for support. The Norman counts of Sicily had become kings of Sicily and southern Italy. Once established, the Norman kings took part in the dynastic history of Europe.

In any Mediterranean-orientated society Sicily will be of immense commercial and strategic importance. Their possession of the island led its Norman rulers into military ambitions elsewhere in the Mediterranean, although interestingly when they turned from infiltration to outright conquest they met with middling success. In 1091 Malta was conquered, but attacks on the coast of North Africa (approximating to modern Algeria) in 1118 and 1123 did not result in a permanent settlement. Norman attempts to conquer the southern Balkan peninsula were similarly frustrated by Byzantine and Venetian opposition. First in the years 1081–85 Guiscard's attacks on Corfu and Dyrrachium (Durazzo) were checked by Alexios I; in 1107 Bohemond was defeated in a second attack on Dyrrachium and was forced to sign the Treaty of Devol acknowledging Byzantine suzerainty over his principality of Antioch; in 1147 Roger II raided Thebes and Corinth carrying off silk workers to Sicily; and finally in 1185 the Normans briefly occupied Thessalonica before being driven out by a Byzantine relieving force under Alexander Branas. The occupation and the Norman's behaviour towards the Greeks were described by Eustathios of Thessalonica. All in all, Norman attempts at conquests in the Byzantine empire were heavily defeated. Neither Byzantium nor Venice could tolerate one power controlling both shores of the southern Adriatic.

In southern Italy and Sicily there emerged a cosmopolitan and remarkable state – one that owed little to Norman institutions but relied upon Greeks, Muslims, and settlers brought in from mainland Italy where the official languages were French, Greek, Arabic, and Latin, and where four religions coexisted in apparent harmony. It is a state all too easy to eulogize. Through time Latin elements came to predominate in the administration, Muslims were largely confined to the fortress settlement of Lucera, and Greek priests came under considerable pressure to Latinize. Norman Sicily appears none the less remarkably tolerant for its age and the capture of Palermo in 1072 stands as a monument to wise concessions and compares favourably to the capture of Jerusalem in 1099.

Summary

The Normans first appeared in Italy as mercenaries to the Lombards in 1017. After 1040 they began to make their own conquests, taking Messina (1061), Bari (1071), Palermo (1072), and Syracuse (1085). The Norman kingdom of Sicily was established in 1130. But the Normans had no success against the Byzantines in the Balkans.

Novel

Ancient

Five complete lengthy fictional prose narratives (conveniently called "novels" or "romances") survive from Classical antiquity: *Callirhoe* by Chariton of Aphrodisias (8 books; probably 1st century AD); *Ephesian Story* by Xenophon of Ephesus (5 books; probably pseudonymous; 1st–2nd century AD); *Leucippe and Cleitophon* by Achilles Tatius (8 books; late 2nd century AD); *Daphnis and Chloe* by Longus (4 books; 2nd–3rd century); and *Ethiopian Story* by Heliodorus of Emesa (10 books; 3rd–4th century AD). In addition Photios in the 9th century read and summarized at length two works now lost: *The Wonders beyond Thule* by Antonius Diogenes (24 books; late 2nd century AD) and *Babylonian Story* by Iamblichus (16 books; soon after AD 165). Since the 19th century, our knowledge has been supplemented by the discovery of papyrus fragments of several more lost novels, the most important of which is the so-called *Ninus Romance*, probably of the 1st century BC and thus the earliest known example of the genre.

The extant works form a tightly knit corpus of "ideal" romances, all sharing essentially the same plot: a beautiful and noble couple fall in love and, either before or just after marriage, pass through a number of adventures, generally including separation and extensive and perilous journeys during which they encounter pirates and suffer shipwreck, apparent death, and unwelcome amatory advances from rivals of both sexes, remaining faithful to one another until they are eventually reunited and return home, implicitly to live happily ever after in a state of wedded bliss. The patron gods of the romantic world are Tyche (Chance) and Eros; the role of the protagonists is generally to suffer nobly and lament tragically, rarely to act decisively. Despite the skill that some novelists show in characterization, the interests of the form as a whole are with plot rather than psychology. However, all the individual writers vary the basic formula to some extent, and some of the papyri are radically different in tone and content, indicating that the apparent uniformity of the genre is in fact largely due to the tastes of Christian Byzantium.

The novel was the last of the literary genres to appear in antiquity, and much scholarly labour has been devoted to the question of its origins. Particularly influential was Erwin Rohde's hypothesis that it arose from a combination of travel stories and Hellenistic erotic narrative poetry. Others have suggested that the novel evolved out of Hellenistic historiogra-

phy, with its concern for emotional effect, or New Comedy, with which it shares plot elements of amatory intrigue, or obscure local legends, or have sought the roots of the Greek novel in the narrative traditions of Egypt and the Near East. More recently, however, a consensus has emerged that the undoubted similarities and references to earlier literature – particularly the central texts of Homeric epic, and Classical tragedy, rhetoric, and historiography – are less a sign of the genre's origins than of a deliberate self-positioning in the Classical tradition on the part of its exponents.

This bears on the important question of the readership of these early novels. There is very little direct evidence on this point. The novel was neglected by ancient critics, to the extent that there was not even an agreed term for this type of literature before the Byzantine period. The few references to novels and novel-reading are unanimously uncomplimentary. This silence played to the prejudices of 19th-century scholars against romantic fiction, and gave rise to a widely held view that the novel was intended for a mass readership created by the spread of literacy in Hellenistic times, and including such marginal groups as women, young people, and the half-educated. However, as physical objects the novel papyri are indistinguishable in quality from other texts, in no way suggesting a cheap and down-market product, and their numbers remain relatively modest, although we cannot be certain to what extent any given copy may have circulated from reader to reader. Even the simplest of the novels would require a high level of literacy on the part of its readers, and the intertextual play of most of them implies an audience intimately familiar with a wide range of literature. In other words, it looks as if the people who bought and read novels were more or less those who read the rest of Greek literature.

This conclusion in its turn implies that the novel as a genre emerged to supply a market demand for pleasurable reading among the educated urban elite of the Greek east in the Hellenistic and imperial periods. We must not, of course, assume that every reader at every period had the same motive for reading novels, but it seems likely that the novel, as a form, was intended for private reading and that the thematic centrality of love reflects a new concern with the individual self. Moreover, all the novels deal in some oblique form with the question of what it means to be Greek and stress a continuity with the Hellenic past that pointedly ignores the very existence of Rome. Interestingly, none of the surviving novelists was a native of the Greek mainland, and several of them were of non-Greek extraction, indicating that the national identity they assert was cultural rather than racial. The central feature of the romantic plot, the exclusive and passionate love of a heterosexual couple, is an important cultural innovation. The Classical model of disparity between sexual partners with an interior dialectic to master potentially disruptive emotions is replaced by a fully reciprocal passion, viewed positively as a valid basis for personal happiness and marital stability. It is difficult to know to what extent the sexual ethic of the novels reflects a movement towards romantic behaviour in real life, but the aspirations it embodies are as much civic as personal. The marriage that is consummated or resumed at the climax of the plot is not just a way of socializing passion, but is in itself a social function, a celebration of the ancestry and self-perpetuation of Hellenic aristocracy and its values and culture.

The earliest novels have a distinctly historical thrust, as if legitimizing their problematic fictionality by filling up the unwritten corners of history. The earliest known novel takes the legendary figures of Ninus and Semiramis – accepted as historical from Herodotus onwards – and transforms them into romantically attached adolescent cousins coyly seeking parental assent to an early marriage. Chariton sets his story in the years following the Peloponnesian War, with a heroine who is a historically attested daughter of the Syracusan statesman Hermocrates, and a Persian king Artaxerxes facing a revolt in Egypt apparently modelled on that of 360 BC. Among the fragmentary novels is one whose protagonists are the son of Miltiades and the daughter of Polycrates of Samos, and whose scenario plays out around events recorded by Herodotus. Later novels emancipated themselves from literal historicity, and in some cases moved their plots into more exotic locations, which none the less adhere to a geographical and historical verisimilitude defined by Greek literary tradition.

There is a marked division among the five extant novels between, on the one hand, Chariton and Xenophon, who are relatively simple in construction and expression, and, on the other, the three later authors, whose erudition and complexity are clearly linked with the rhetorical renaissance known as the Second Sophistic. Chariton tells his story with pace and skill, in a style modelled on that of Xenophon, maintaining the pose of a historian roughly contemporary with the events he narrates. Although his is probably the earliest European novel to have survived, it is already playing with the ethical simplicity of its generic stereotypes. Its heroine, for example, is apparently kicked to death by her beloved but jealous husband near the beginning of the book. Reviving in the tomb, she is stolen by tomb-robbers and taken to Miletus, where she discovers that she is pregnant and reluctantly agrees to a bigamous second marriage for the sake of her unborn child. The second husband, who fills the conventional role of rival, is no villain, but a cultivated and morally scrupulous gentleman, agonizing over his infatuation. Xenophon's novel is, in terms of literary quality, the weakest of the five: baldly narrated and luridly imagined adventures succeed one another rapidly and with little rational connection, prompting the theory that what we have is only an epitome of a more satisfactory original. Of the sophistic novelists, Achilles Tatius is the only idealistic novelist to employ a first-person narrator, and his story often comes close to parodying the genre: the heroine Leucippe, for instance, would be only too happy to lose her virginity prematurely to the hero and narrator, Cleitophon, and is saved only by a comically sexual dream that leads her mother to interrupt their illicit tryst. Later, the theme of apparent death takes a Grand Guignol twist when Leucippe is ritually disembowelled before her lover's eyes and her entrails cooked and eaten, only for him to learn a couple of pages later that her sacrifice was an elaborately staged trick with a retractable knife and a sheep's bladder. Cleitophon for his part, when Leucippe is apparently decapitated, obsessively maintains his chaste devotion despite being married to an amorous and increasingly frustrated widow from Ephesus; but when his beloved and his wife's husband return miraculously from the dead, he casually consummates the now void marriage on a jailhouse floor before escaping disguised as a woman. Achilles packs his pages with sophistic digressions and rhetorical debates, for example

on the relative merits of heterosexual and homosexual intercourse or the effects of love in the natural world. Of the two novels summarized by Photios, that of Antonius Diogenes was untypical of the genre: immensely long and relegating the love interest to subordinate episodes, it dealt primarily with travel and geographical paradoxography, leavened by a dose of black magic and the supernatural, and was elaborately structured as a series of concentric narratives, including some plausibly serious Neopythagorean philosophy. Iamblichus' novel seems to have been full of sensational and melodramatic incident, and innovated by keeping its lovers together in body but separated by psychological forces such as the heroine's homicidal jealousy.

The ideal romance was not the only form of fiction written in ancient Greek, but the absence of critical discussion from antiquity makes it impossible to know precisely how fictional genres were conceptualized. The old distinction between the serious idealistic Greek romance and the comic-realistic novel represented by the Latin writers Petronius and Apuleius seems untenable in the light of the recent identification of fragments such as those of the *Phoenician Story* of a certain Lollianus, which combine blood-curdling horror and scatological comedy. It may be that other boundaries, such as that between full-length novels and *Milesian Tales*, short stories of scabrous content, are equally illusory.

With the probable exception of Heliodorus, the production of novels apparently ceased early in the 3rd century AD, although papyri indicate that they were still read, at least in Egypt, in the 7th. The disappearance of the genre may be partly due to its inherent limitations and progressive ossification, but the most important causes must be sought in the changing cultural circumstances of late antiquity which removed its market appeal. However, motifs from the romances find their way into Christian narratives such as hagiographies, martyrologies, and apocryphal acts, and at least one of them (*Metiochus and Parthenope*) was absorbed into Near Eastern traditions. In Byzantium, Heliodorus and Achilles Tatius were to some extent privileged by the fact that their authors were believed to be Christian; Achilles' protagonists even resurface as the parents of St Galaktion of Emesa! Despite spasmodic signs of interest, including Photios in the 9th century and a spate of learned imitations in the 12th, the survival of the rest was precarious, and they had little direct influence either on the later vernacular romances or on the birth of the modern Greek novel, both of which looked to models from western Europe.

Modern

The rise of the novel in 18th-century England is not normally associated with ancient or medieval Greek novels such as those by Longus or Heliodorus as these were not part of the regular Classical curriculum. It was different in Greece where in the early 19th century a revival or interest in Classical culture led to claims that Greeks had invented the novel. Thus the first Greek novels published after Independence, with their strong emphasis on romantic love, undoubtedly have affinities with ancient and medieval models. This is true of the first modern Greek novel, *Leander*, published in 1834 by Panayotis Soutsos, although references to Johann Wolfgang Goethe and Ugo Foscolo in the preface show other influences. Soutsos's brother Alexandros in the next year published *The Exile of 1831* dealing with recent history in the fashion of Sir Walter Scott. With inspiration both from Greece and Western Europe, a rich Classical and Byzantine heritage, and a turbulent and sometimes tragic history to draw upon, Greek novelists have no shortage of material. Indeed, it could be argued both that individual Greek novelists became confused by the wealth of subject matter, and that the history of the Greek novel as a whole is confused by the variety of different influences.

Most 19th-century novelists were strongly realist, but Greece lacked professional novel writers like Charles Dickens

and Honoré de Balzac, and until the end of the century did not really have a novel-reading public as in Western Europe. A few names stand out. Pavlos Kalligas's novel *Thanos Vlekas* (1855) owes something to the ancient Greek novel with its highflown style and simple allegory of the fight between good and evil, although there are nice touches of social realism. Emmanouil Roidis's *Pope Joan* (1866) is a bitter satire against the Orthodox Church. Both authors had been educated in the West; a more typically Greek product was Alexandros Rangavis's *Lord of the Morea* (1850), a historical novel owing a debt to *The Chronicle of the Morea* and to Scott. Towards the end of the century, although often fiction writers chose to write short stories rather than novels, there were moves forwards under the influence of Emile Zola towards total realism and to experimentation with novels challenging the realistic convention. Andreas Karkavitsas's *The Beggar* (1896) and Alexandros Papadiamantis's *The Murderess* (1903) display both these characteristics.

In the 20th century pressing political events such as the disaster in Asia Minor, World War II and the subsequent Civil War, and the ideological clashes between left and right played an important part in a great many novels. Simultaneously, novelists were affected by literary movements in the West, notably symbolism, and by a wish to bring in Greece's Classical and medieval past. Greece's most famous novelist is Nikos Kazantzakis (1883–1957). Like many other Greek writers of fiction, he was also active in poetry and drama, most of his novels being written towards the end of his life. *Zorba the Greek*, published in 1946, although written in the period of the Nazi occupation, deals with 20th-century Crete, but has references to Plato's dialogues, and like his earlier epic poem *The Odyssey* is full of links to the literature of the world. *Christ Recrucified*, written in 1949, but published in 1954, is set in Anatolia just before the disastrous war of 1919–22, but reflects on perceptions Kazantzakis had gained outside Greece, reaches outside the bounds of realism, and has echoes of the Civil War, a subject to which he returned in *The Fratricides*, posthumously published in 1963, but written much earlier. Kazantzakis is the Greek novelist most readily available in translation. He is hardly typically Greek, having spent most of his life as a novelist in the United States, but his novels do reflect Greece's explosive and encyclopedic heritage.

Less well-known novelists with a rather longer career are Stratis Myrivilis (1892–1969) and Ilias Venezis (1904–73). Both lived in Mytilini, and both were affected by the Anatolian campaign. Both gave a new edge to that type of Greek novel which had concentrated on life in a small community, adding a few romantic touches. Myrivilis's *Life in The Tomb* (1924) dealing with World War I and Venezis's *Number 31328* (1924) dealing with the aftermath of the Anatolian campaign are clearly based on first-hand experience but ask deep metaphysical questions. Later novels by both authors such as *The Mermaid Madonna* (1949) by Myrivilis and *Aeolian Earth* (1943) by Venezis ran into difficulty with censorship under the Metaxas dictatorship and the war years. Experimental novels such as Yorgos Theotokas's *Argo* (1933) show the weight of history with which the Greek novel has to contend. There are references to contemporary historical characters such as Venizelos and Mussolini as well as glances back to Byzantine history and Classical legend, and the novel is full of religious symbolism as well as including links with European fiction. And yet, in spite of the breathless speed of its second volume, *Argo* achieves a kind of detachment as well as preserving its essential Greekness. Both of these latter features are lacking in the work of M. Karagatsis (1909–60) whose tragic characters, all foreigners, are driven to their doom by a sexual passion too powerful for them to control.

Karagatsis and Theotokas were able to bring Greek fiction into line with the main stream of European literature, as represented by such authors as Gustave Flaubert and Fyodor Dostoevsky. Another group of writers based on Thessalonica were more interested in writers such as James Joyce and tried to break away from realism altogether. Yannis Skirimbos (1893–1984) anticipates Samuel Beckett. Nikos Pentzikizis (1909–92) has a hero in his first novel who turns himself into a pot plant before drowning himself in despair in a manner reminiscent of some of Franz Kafka's heroes.

These experiments came to a fairly abrupt end with the imposition of the Metaxas dictatorship in 1936, followed by three years of Axis occupation. None of the writers previously mentioned was particularly sympathetic to communism or subject to censorship and repression, but a number of the novelists who had seemed experimental in the 1920s and early 1930s now returned to more traditional themes, often reverting to the experiences of their early years, sometimes delving back into the remoter past. Myrivilis and Venezis wrote about rural villages before 1922, Theotokas about Constantinople at the turn of the century, Pentzikis in his second novel *The Dead Man and the Resurrection*, finished in 1938, published in 1944, described the history of Thessalonica. Kosmos Politis (1888–1974), who had previously written novels about smart Athenian society, in *Eroica* (1937) deftly blended memories of his native Smyrna with parallels from the *Iliad*. Both novels contain innovative touches and, as with Melpi Axioti in *Difficult Nights* (1938), perhaps try to do too much in linking modernist trends with the weight of oral tradition and in trying to be both European and Greek.

Two women novelists, writing at the very beginning of the Civil War, chose to retreat to the 1930s, although both *Straw Hats* (1946) by Margarita Lymberaki and *Contretemps* by Mimika Kranaki (1947) are full of ominous portents, and the latter novel touches upon the German invasion and the People's Army. Angelas Terzakis and Karagatsis wrote long novels, *Without a God* (1951) and *The Yellow File* (1956) respectively, which end on the brink of World War II, but contain implied criticisms of communism. *The Yellow File* is an elaborate construction about the life of a novelist who thought he could view the world with scientific objectivity and even reform it accordingly, but ignored human nature. There were realistic attempts to portray the war. Yannis Beratis, who also wrote experimental novels, produced in 1946 an account of the Albanian campaign and the struggle of the right-wing guerrillas in Epirus in *The Broad River* and *Itinerary of 1943*. Theotokas wrote *Sacred Way* (1950) and *Invalids and Travellers* (1964) about the war against the Germans and the Civil War in the same almost documentary fashion.

Experimental novels did not really become more popular until the more prosperous 1960s, although Lymberaki published *The Other Alexander* (1950), a curious allegorical novel about two branches of a family with an explicit reference

to the Civil War. Tatiana Gritsi-Milliex in *Behold A Pale Horse* (1963) and Stratis Tzirkas in *Drifting Cities* (1960–65) wrote accounts of recent events from a left-wing viewpoint with a certain amount of experimentation. The best-selling novel of the 1960s, frequently reprinted thereafter, was *Farewell Anatolia* by Dido Sotiriou (1962). This dealt with the Anatolian disaster, but said that it was international capitalism which had brought it about. Other allegorical novels were *The Dam* (1967) by Spyros Plaskovitis, a surprising last novel by Theotokas, *The Bells* (1966), and Pentzikis's masterpiece, *The Novel of Mrs Ersi* (1966), a good combination of traditional Greek motifs and western postmodernism.

Novels by Lymberaki, *The Rite* (1976), by her daughter, Margarita Karapanou, *Cassandra and the Wolf* (1977), *Usurped Authority* (1979) by Alexander Kotzias, and *Fools' Gold* (1979) by Maro Douka reflect the conditions under the Colonels, and *The Box* (1974) by Aris Alexandrou is an allegorical tale of the Civil War made more bitter by recent experiences. All of these works deal with Greek history, but not as objective truth; the narrator's search for the exact truth in *The Box* is shown to be as empty as the box in which he supposedly carries the papers which record his mission. *Fool's Gold* admits that the heroine's reminscences of the 1967 coup may be inaccurate, and points out the inadequacy of language to describe reality.

Three novels of the 1980s, *History* (1982) by Yoryis Yatromanalakis, *The Seventh Garment* (1983) by Evyenia Fakinou, and *The Life of Ismail Ferik Pasha* (1989) by Rea Galanaki, all deal with the recent Greek past, all recall the ancient Greek past, and all try to come to terms with modern Western influences. Like other writers, notably Kazantzakis, they may be accused of taking on too much, of trying to do many things at once; at the same time they achieve a fair amount of success, and the way forward for the Greek novel looks as promising if as baffling as it does for the novel in general.

O

Obsidian

Obsidian is a kind of volcanic glass, normally dark blue to black in colour. It is exceptionally hard, fractures in the same way as flint, and, like flint, was employed to provide razor-sharp cutting edges for tools (including knives and sickles) and weapons (including arrowheads). Studies of the techniques of manufacture of marble figurines have suggested that obsidian implements were among the tools employed.

In use from the Palaeolithic period, obsidian seems to have been most commonly employed in the Aegean during the Neolithic and Early Bronze Age, before bronze had become widely available. In the Late Bronze Age, vessels were occasionally manufactured of this material, usually a variegated type.

Investigation of the extent to which obsidian continued to be used in later antiquity has proved somewhat inconclusive but it seems likely that, in addition to flint and chert, it was a regular alternative to metal in places where the latter was unavailable because of cost or inaccessibility. Today these materials are still sometimes used by primitive agricultural communities for the "teeth" of sickles and threshing sledges, and they have been employed for gun flints.

The only two ancient Aegean sources of obsidian are on the islands of Melos (in the southwestern Cyclades) and Yiali (by Nisiros in the Dodecanese). That on Melos was the earlier and by far the most important; Yiali obsidian was used for most of the Late Bronze Age vessels mentioned previously. Melian obsidian is widely distributed on prehistoric sites in the central and south Aegean and on the Greek mainland as far north as Thessaly. Sometimes it is found in the form of finished artifacts, sometimes as unworked cores. The finer blades were struck off larger "cores", or else detached by "pressure flaking" with a wooden tool.

Obsidian was probably an important item of trade in prehistoric times. One theory sees the commodity exploited by the Melians and exported by them, either worked or unworked; another holds that the raw material was removed by visitors to the island, without reference to the locals, and worked elsewhere.

The significant contributions of obsidian to the Greek tradition seem chronologically limited to the prehistoric phase. It certainly played an important part in technological developments which affected warfare and various "industries" and crafts. Just as important however was its role in stimulating trade and contact, and in giving the Aegean area in general and Melos in particular some economic and cultural sway over their neighbours. Apparently Melian features in the pottery of other islands, and Cycladic exports to and influence on sites on the Greek mainland in the Early and Middle Cycladic periods, may have been brought about in this way.

In Classical and later times the use of obsidian helps to demonstrate the natural dependence of poorer and more remote communities on cheap and accessible raw materials, and thus relatively primitive technology. In this way clearly documented uses of the material can often illuminate prehistoric finds where direct evidence for the function is lacking. Such links also suggest a long and continuous history of use.

Odessa

City on the north Black Sea coast

Odessa, now a city of more than one million inhabitants, is in Ukraine between the estuaries of the Dnieper and Dniester. Though long sought by the tsars, it was only in the time of Catherine the Great (1762–96) that Russian rule over the north coast of the Black Sea became a reality. Under Catherine two cities were founded in this newly acquired territory. The first was Kherson, near the mouth of the Dnieper on a site wrongly identified with ancient Greek Cherson. In 1794, two years after the Treaty of Jassy had further extended Russian rule, Catherine decided on a second port on the recommendation of Joseph de Riba, a Naples-born Spanish adventurer of Irish extraction. The site selected was Khadzhibei. Again a Greek name was chosen: Odessa; and again the identification was erroneous, for the new port lay far from the ancient Greek colony of Odessos which is Varna in Bulgaria. Perhaps it was hoped that the name would attract Greek merchants. The feminine *Odessa* for *Odessos* is said to have been chosen by Catherine at a court ball.

Odessa was at once an enormous success: it was soon the fastest-growing city in Europe. It "had no infancy", as a contemporary said. It occupied a splendid position on cliffs rising 60 m above the sea, a contrast to the dreary steppe to the north. The climate was benign, but for the dust storms from the thin limestone soil which turned to mud in winter. The deep harbour had ice only in January. Already by 1805 Odessa was the busiest port in the Black Sea. Until the Crimean War (1853–56), the black earth lands of Ukraine supplied much of western Europe with wheat, and even later in the century Odessa continued to supply Italian needs, for the high gluten content of wheat from Ukraine made it especially suitable for pasta. Religious toleration, encouragement of foreign immigrants, and low tariffs led to a burgeoning population swollen by runaway serfs, a "European Australia". Visitors remarked on the easy atmosphere which tolerated smoking in the streets, a practice frowned on in St Petersburg.

From 1803 to 1814 the governor appointed by the tsar was Armand Emmanuel du Plessis, Duc de Richelieu, a great-nephew of the cardinal, a hero of Byron and Pushkin and later minister of Louis XVIII. Richelieu was an attractive figure – modest, industrious, affable, and a good linguist – who mixed freely with the inhabitants. To him Odessa owes its gridiron plan, its spacious streets, and characteristic acacia (actually, locust) trees. Under his governorship, the population rose from 7500 to 35,000. In 1838 the American traveller John Stephens found Odessa with its broad, straight streets just like an American city. In the 1860s Mark Twain shared the same feelings. A Swiss visitor heard 20 tongues spoken and claimed that ten religions were practised. Italian then Greek were the principal business languages. Half the wheat exported from the docks went to Italy and the street names were in Italian as well as Russian.

Within a year of its foundation, Greeks, whether transient merchants or settlers from the archipelago, made up about 10 per cent of the population. A Greek battalion fought with the Russians against the Turks, and the Greek community made a financial contribution to the Russian war effort against Napoleon. By 1817 there were three Greek insurance companies, who established what became known as the second-best school in Odessa. Many Greek merchants became rich and powerful. Among these were the Inglesi, one of whom, Dimitrios, became mayor in 1818–21. John Ralli, whose family originated on Chios and whose connections extended over three continents, served as United States consul from 1832 to 1859. Stephens describes meeting him. Ralli was president of a society for the welfare of animals, although the ferocity of his dogs was such that rumour claimed they attacked his own servants. Also from Chios was the Rodonachi family with members in Livorno and Marseilles. Greek churches were built (one remained open in the Soviet period) and a monastery of St Panteleimon on the model of the Russian monastery on Athos (it is now the planetarium). The Mavrokordatos family contributed to industrial and cultural life. In 1814 a house in Odessa, now a museum, was the birth place of the *Philiki Hetaireia*. Greek coffee houses flourished. Later in the century, the Greeks were eclipsed by the Jews who became the second-largest group in the city after the Russians. The Greeks tended to resist the policy of assimilation favoured by the Russian authorities. There was endemic hostility between the Greek and Jewish populations and the pogrom of 1871 arose from Jewish–Greek rivalry. By the time of the censuses of 1892 and 1897 less than 2 per cent of the population spoke Greek and Greek-speakers were only the sixth-largest group. Many were only temporary residents. By then about half the population spoke Russian or Ukrainian, while just over 30 per cent spoke Yiddish.

During the Crimean War an Anglo-French squadron bombarded Odessa. The base of the statue of Richelieu was damaged, but a frigate, the *Tiger*, was lost and one of its guns is displayed not far from the statue. The years before World War I saw a decline in the fortunes of the city: development was inhibited by shortages of coal, wood, and fresh water; the railway was slow to come; industrial discontent grew and political and nationalist dissent flourished, as did crime. In June 1905 the mutinous battleship *Potemkin* sailed into Odessa; in subsequent disturbances some 600 people were killed and the docks were destroyed. (The famous scene on the monumental steps in Eisenstein's film is largely invention.)

The modern visitor can still enjoy the spacious boulevards with planes and chestnuts, as well as the acacias. Many buildings have been restored in pleasing pastel colours. The vines which festoon many apartment blocks produce grapes for New Year parties. The archaeological museum houses important exhibits from the Greek colony of Olbia on the Bug; these include coins, figurines, vases, and an inscription in Latin and Greek confirming privileges granted by the emperor Antoninus Pius (138–61). Other finds displayed are from Berezan island and from Tyras, Panticapaeum, and other Greek colonies on the northern shore of the Pontus.

Summary

A city on the coast of the Ukraine, Odessa was founded by Catherine the Great in 1794. It grew fast and by 1805 was the busiest port in the Black Sea with a cosmopolitan population. The principal export

was wheat. The Greek community was rich and powerful for much of the 19th century. It was the birthplace of the Friendly Society (*Philiki Hetaireia*) in 1814.

Ohrid

City in western Macedonia

The history of medieval and modern Ohrid – which is located on the northeast shore of Lake Ohrid very close to the site of ancient Lychnidos on the Via Egnatia – is mainly distinguished by ecclesiastical developments. The local diocese, which played an important role in Balkan history, was under Greek control for centuries.

The earliest references to medieval Ohrid are linked to the spread of Christianity in the Slavic Balkan areas in the late 9th century. As a result of Boris I's decision to adopt the Christian faith and to opt for the Eastern Ortbodox Church, the Christianization of the south Slavs was accelerated and the basis for the foundation of a Bulgarian Church was laid down, in a period when Bulgarian rule extended in the western Balkans as far as the Adriatic. Yet, the establishment of the Orthodox Church proceeded differently in the eastern and western parts of the Bulgarian dominions. In the eastern part, the task was undertaken by Greek-speaking Byzantine clergy sent directly from Constantinople. But the Christianization of the western Bulgarian dominions in Macedonia and Albania was initiated by a mission of Slavonic-speakers led by St Clement and St Naum, both of whom were disciples of St Constantine (Cyril) and St Methodios who had led the Moravian mission (863). St Clement arrived in the region in 886 and settled in Ohrid, which is first recorded with respect to those events. There he worked towards the training of a Slavic-speaking clergy and also organized the building of churches and monasteries, including the earliest (trefoil) phase of St Panteleimon in Ohrid (which later became a mosque and is known as the *imaret*).

More emphasis was given to Ohrid later, when Samuel (*c.*976–1015) chose to establish a Bulgarian patriarch there in the heyday of his shortlived empire. In fact, Samuel's ecclesiastical arrangements were followed by his great enemy, the Byzantine emperor Basil II (976–1025), who, after crushing the last remnants of Bulgarian resistance in 1018 and aiming at the integration of the west Balkan Slavic population into the Byzantine empire, took the decision to preserve a Bulgarian Church based in Ohrid. His plans materialized in the formation of the archbishopric of Bulgaria, an autonomous ecclesiastical body under the patriarchate of Constantinople, with authority over the lands of Macedonia, Serbia, and Albania which were incorporated into the Byzantine state in 1018. Apparently the archbishopric of Ohrid had no authority over the eastern areas of Bulgaria proper. Moreover, the area of its jurisdiction was reduced in periods when the Serbians had their own independent Church, i.e. between 1219 and the Ottoman conquest, and after 1537 with the establishment of the Serbian patriarchate at Peć.

Basil II's plan was to preserve the Slavic character of the archbishopric of Bulgaria, so the first archbishop he appointed, John, was a Slav. The decision to Hellenize the archbishopric was taken by his successors who, as a first step, replaced John with a Greek archbishop, Leon, who is especially renowned for building the cathedral church of St Sophia in Ohrid. So began the line of Greek archbishops that lasted until the archbishopric was abolished in 1767. Among them were some important scholars, such as Theophylact (late 11th–early 12th centuries), whose works include a *Life of St Clement*, and Demetrios Chomatenos (d. *c.*1234), who crowned Theodore Doukas of Epirus emperor of the Romans in 1224. Apart from the archbishops, the other senior clergy were Greeks too, and Greek was the official language. Nevertheless, Slavic was not completely excluded and was used by many of the lower clergy.

The Greek dominance of the archbishopric was not affected by Bulgarian (1205/07–15 and 1230–46), Serbian (1334–71), Albanian (from 1371), or Ottoman (from the 1390s onwards) rule in Ohrid. As a matter of fact, this Greek dominance of the archbishopric became a primary factor in the development of Greek cultural influence, not just in Ohrid itself, but in the rest of the archbishopric's jurisdiction as well. The Greek element of the town's population was not limited to the staff of the church, but included many among the local elite, both landowning and commercial, and probably others. A distinguished personality among the Greeks of Ohrid was Prodromos Sgouros, who patronized the building of the Peribleptos church in the 13th century. Three centuries later, this church was rededicated to St Clement (it still bears this name) and became the archbishop's seat, after the church of St Sophia was converted into a mosque. As with several towns in Macedonia that had a strong Greek element, the history of Ohrid in the 18th century is marked by the development of Greek education and the foundation of Greek schools. It is unquestionable, however, that the majority of the town's population were Slavic, as they are today. The Greek element of Ohrid declined and finally perished in the years after 1913, as a result of the town's annexation by Serbia and the subsequent abolition of Greek educational and ecclesiastical institutions.

KONSTANTINOS P. MOUSTAKAS

Summary

A city now in the Former Yugoslav Republic of Macedonia, Ohrid is first mentioned in the 9th century when St Clement arrived to establish Christianity. It was probably the capital of the empire of Samuel of Bulgaria. Basil II established a Bulgarian Church with an archbishopric at Ohrid. From later in the 11th century until 1767 (when the archbishopric was abolished) the archbishops and senior clergy were Greeks. Local elites were also Greek to a considerable extent until 1913, when the town was annexed by Serbia.

Olbia

City on the north Black Sea coast

Olbia, situated on the right bank of the river Hypanis (today Bug), near the mouth of the river Borysthenes (now Dnieper) in modern Ukraine, was founded by the Milesians, possibly as early as the end of the 7th century BC (according to the finds). It was one of the largest Greek colonies on the north coast of the Black Sea and was well known in the ancient world. Surrounded by native tribes (Scythians, later Sarmatians), Olbia had close, but sometimes tense, relations with its hinterland. Already in the first half of the 6th century numerous small settlements had developed on both banks of the Hypanis and Borysthenes, the most important of them on the island of Berezan.

Written sources about Olbia are rather scarce (and are for the most part inscriptions), but there are rich archaeological finds; as there was no later reoccupation of the site, it has consequently suffered only from being used as a quarry in the 18th and 19th centuries for the construction of the Turkish (and later Russian) fortress at Ochakov, and for building houses in the neighbouring village of Parutino. The area has been excavated in many campaigns since 1901.

The ancient city had a triangular shape with an upper town and a lower one which is now largely submerged beneath the waters of the Bug. The upper town began to be settled in the 6th century BC; some of the excavated streets go back to that time (it has now become clear that Olbia never had a unified rectangular street system, as was long assumed). About 550 BC the temenos of Apollo Iatros was constructed, some 20 years later that of Apollo Delphinios, and – to the south of it – the agora followed. About 500 BC the style of private housing changed from dug-out dwellings to surface buildings.

The city was most prosperous from the 5th to the 3rd centuries BC. Its harbour was one of the main emporia on the Black Sea for the export of cereals, fish, and slaves to Greece, and for the import of Attic goods to Scythia. Its silver and bronze coins (not minted but cast) circulated widely. In the 5th century Olbia may have been intermittently under the sway of a local tyrant or of Scythian princes; at the beginning of the 4th century the city acquired a democratic constitution (*demos* and *boule* appear regularly in inscriptions). Already in the middle of the 5th century it had undertaken intense building activity (around this time Herodotus visited the city to gather information about the surrounding regions). The territory of the city increased, with the lower town now being populated as well; a water supply system and probably also the first city wall were built. The construction of private houses reached a peak at this time; the houses (built with stone or brick walls and tiled roofs), of one or two storeys, often had a cellar, wall painting, and mosaics. In the necropoleis found to the north, west, and south of the city many graves had vaulted tombs in a form characteristic of the north Pontic area.

The central *temenos* (precint), dominated by the Ionic temple of Apollo Delphinios, was enlarged and given its trapezoidal form; apart from the main altar (with a platform probably for the priest and three holes for wine offerings), there were several other buildings in the precinct (further altars, a treasury, a cistern, a workshop for bronze). In the agora area a gymnasium was built, probably with a bath (enlarged in Hellenistic times). The western *temenos*, with a columned hall at its entrance, contained sanctuaries for Apollo Iatros and later for Hermes, Aphrodite, and the mother of the gods, a building of unclear function with three round and six rectangular altars. Since the 6th century BC one of the most important cults in the lower Bug region had been that of Achilles, imported by the Milesian colonists and originally centred on the island of Leuce (thought to be the dwelling place of the great hero), where the inhabitants of Olbia erected several monuments with inscriptions; countless magical graffiti, including the name of Achilles, were found in Olbia itself and its surroundings. Moreover, in the central *temenos* little plates made from bone with graffiti on them testify to the existence of a thriving community devoted to Orphism (a mystery cult centred around Dionysus and Orpheus) at Olbia in the 5th century. Many works of art (sculpture in stone, clay, and bronze and reliefs), imported from Greece as well as of local origin, have been found, such as a late Archaic *kouros* (naked youth) of limestone from the gymnasium, the famous grave stele of Molpagores' son Leoxos (490/480 BC) showing a naked youth in Greek style on one side and a person in Scythian clothing on the other, and the votive relief of the *sitones* (see below). There was also extensive local production of vases.

Reports of further political events are scarce. At the beginning of the Hellenistic period (probably around 325 BC) Zopyrion, Alexander the Great's governor of Thrace, made an unsuccessful attempt to take Olbia by force. New building activity shows the ongoing importance of Olbia as well as the persistence of threats from outside: numerous fortified farmhouses were built in the vicinity; the agora was provided with an impressive portico, and other new public buildings were constructed, the town walls renewed, and several towers added; a new cult, that of the god Demos ("people"), was established. Since the middle of the 3rd century BC, however, the whole agricultural territory of Olbia was repeatedly pillaged by invading barbarians, which put the nutritional base of the city severely at risk. A board of five *sitones* (food commissioners) was then installed who had to procure cereals and distribute them among the inhabitants; later the city tried to check famine, social unrest, and external threats by courting the leaders of the semibarbarian "Mixellenes" as allies. This

led to the loss of the city's independence. In the middle of the 2nd century BC Olbia was under the overlordship of the Scythian king Skiluros, and in the 1st century BC it became part of the Bosporanian kingdom of Mithridates Eupator. The biggest disaster, however, came with the sack of the city by the Getae under King Burebista in 55 BC: Olbia was burned down and lost two-thirds of its settled area. Still, it continued to exist, albeit on a much smaller scale; more and more native people were integrated among the citizens, and these Scythian elements began to play a major role in the political life of the city. Olbia was in this state when it was visited by Dio of Prusa during his wanderings (i.e. shortly before AD 96); Dio has left a vivid description of the city (which he calls Borysthenes, as others do, because of the proximity of the harbour of Borysthenes on the river of that name) in his *Borysthenitic Discourse*. In the 2nd century AD a new period of prosperous stability began: under Antoninus Pius a Roman garrison built the citadel in the southern part of the upper town; under Septimius Severus the region was incorporated into the province Lower Moesia. Two destruction levels show that Olbia was burned down twice in the 3rd century, probably during the so-called Scythian or Gothic wars. When exactly it ceased to exist is uncertain: Byzantine coins found at the site suggest that a settlement (though very much reduced) may have outlasted antiquity.

Summary

Olbia was a Milesian colony on the north shore of the Black Sea, founded in the late 7th century BC. It flourished especially from the 5th to the 3rd centuries BC. Its harbour was an important entrepot and fine buildings were constructed. Ruled by Scythians in the 2nd century BC and by Mithridates Eupator in the 1st, Olbia was sacked by the Getae in 55 BC. On a reduced scale it continued to exist, possibly into the Byzantine period.

Old Calendarists

Greek Orthodox traditionalist movement

Orthodox Christians who refuse the Gregorian calendar, introduced into the Greek Church in 1924, are called Old Calendarists. By the 6th century AD the calendar promulgated by Julius Caesar as Pontifex Maximus (46 BC) had displaced the Macedonian calendar, widely used in the Greek east since apostolic times. The Julian year is 11 minutes and 14 seconds longer than the solar year. Thus by 1324 the Byzantine astronomer Nikephoros Gregoras observed that the spring equinox was falling seven days earlier than at the time of the First Council of Nicaea (325), which had stipulated that Easter be celebrated on the first Sunday of the full moon following the spring equinox and after the Jewish Passover. Informed of the discrepancy, the emperor Andronikos II Palaiologos refused to alter the calendar. The discrepancy was ten days by the 15th century, when Pope Gregory XIII promulgated a new calendar which excepted from a leap day those century years that are not divisible by 400 (e.g. 1700, 1800, 1900, 2100) and renamed 5 October 1582 as 15 October. Thus the spring equinox was restored to 21 March, its date at the time of Nicaea. One consequence of the Gregorian reform was that Easter might be celebrated on or before Passover.

The pope dispatched Greek legates to Constantinople to win the approval of the patriarch, Jeremias II, for the calendar reform. Jeremias rejected the new calendar as an affront to tradition, a unilateral break with the paschal calendar of Nicaea, and potentially an instrument of Latin proselytism. Jeremias and the patriarchs of Jerusalem and Alexandria imposed anathemas on anyone who might accept the new calendar and *paschalion* (set of dates for Easter) of the pope (1583, 1593).

A change in the attitude of the Constantinople patriarchate is apparent from the encyclical of 1920, "To the Churches of Christ wheresoever they may be", which proposes the adoption of a common calendar as a first step towards uniting the various Christian denominations. The adoption of the Gregorian calendar was promoted by two churchmen with close ties to the Venizelist party, Meletios Metaxakis and Chrysostomos Papadopoulos. As ecumenical patriarch, Meletios convened a Pan-Orthodox congress (10 May–8 June 1923) which recommended a programme of liberal reforms including adoption of the Gregorian calendar and *paschalion*. In February 1923 the revolutionary dictatorship of Colonel Nicholas Plastiras installed Chrysostomos as archbishop of Athens and imposed the Gregorian civil calendar in Greece. With the help of the Plastiras regime Chrysostomos won the permission of the General Synod and the ecumenical patriarchate to proceed with the change of the ecclesiastical calendar on 10/23 March 1924. By retaining the traditional paschal calendar Chrysostomos could argue that he had not incurred the anathemas against the Gregorian calendar imposed by Jeremias and his successors.

The monks of Mount Athos rejected the calendar change and patriarch Photios of Alexandria was sharply critical. Nevertheless, the clergy of the Church of Greece by and large accepted the new calendar. Resistance to the Gregorian calendar within Greece was primarily a lay movement, with the

support of zealot monks from Mount Athos including Arsenios Kotteas, Parthenios Skourlis, and Matthaios Karpathakis. In April 1926 the Church of Greece declared all who refused the calendar change schismatic and excommunicated, and attempted to close the chapels of the Old Calendarists. The apparition of a cross in the sky over the chapel of St John the Theologian on Mount Hymettus on the vigil of the Exaltation of the Cross (14/27 September 1925) afforded miraculous confirmation to hundreds of Old Calendarist worshippers. In 1926 Kotteas founded the "Holy League of the Zealot Monks of Mount Athos" for the purpose of organizing the Old Calendarists. In November 1927 the movement received its first martyr in the person of Catherine Routis, killed by police while seeking to prevent the arrest of an Old Calendarist priest. Traditionalist periodicals such as the *Voice of Orthodoxy* (1927) and the *Orthodox Herald* (1930) were founded. By 1930 there were about 800 chapters of Old Calendarists in Greece.

The movement remained without bishops until 1935, the same year that the monarchy was restored in Greece. At this time Chrysostomos Kavouridis of Florina and two other metropolitans of the state Church were emboldened to break with the new calendar and formed the Synod of True Orthodox Christians of the Church of Greece. They proceeded to consecrate four new bishops, including Matthew Karpathakis. The seven bishops were then put on trial by the Church of Greece; three recanted and returned to the state Church while the others were banished or confined to monasteries.

A split among the Old Calendarists developed after 1937, when metropolitan Chrysostomos of Florina declared that the state Church was to be considered only potentially and not definitively schismatic. Rejecting this position, bishop Matthew constituted his own synod and in 1948 proceeded uncanonically to consecrate four new bishops by himself. The Matthewite synod, currently under archbishop Andreas, continues to deny the validity of all sacraments in the state Church.

Chrysostomos died in 1955 without leaving any successor bishops. In 1962 archbishop Leonty of the Russian Church Abroad travelled to Greece where, together with Akakios Pappas who had been consecrated by other prelates of the Russian Church Abroad, he consecrated three more bishops for the Florinite group without the permission of his synod. On the death of archbishop Akakios in 1963, Auxentios Pastras was elected archbishop of the Florinite synod, a post he held until 1985 when he was deposed for simony in the unauthorized consecration of a defrocked New Calendarist churchman. Since then the Florinites have been led by archbishop Chrysostomos Kiousis. Another schism arose in 1995 when six bishops left the synod under threat of canonical judgement; two of these, Paisios and Vikentios, were attached to the ecumenical patriarchate in 1998. In 1986 bishop Kyprianos Koutsoumbas of the Florinite Synod was deposed for his close relations with New Calendarist clergy. His Synod in Resistance has since then established relations with the Russian Church Abroad. Kyprianos has consecrated numerous bishops, most of whom are not Greeks, and has undertaken an active apostolate against the ecumenical activities of the state Church. Unlike other Old Calendarist groups the Synod in Resistance does not require chrismation before offering the Eucharist to those baptized in the state Church.

The number of Old Calendarists in Greece may be estimated at 150,000. About 60 per cent of these are associated with the Florinite synod of Chrysostomos Kiousis, 20 per cent with the Matthewites, and the remainder with other groupings. Most of the zealot monks on Mount Athos, including the monastery of Esphigmenou and several sketes, are associated with the Kiousis synod. Other important monasteries include those of Kerateas, Kozani, Examilia and Agion Taxiarchon in Corinth, and Koimisis tis Theotokou on Mount Parnes.

The diverse Old Calendarist synods regard the ecumenical activities of the state Church and the patriarchate of Constantinople as evidence that the calendar change was not merely an attack on the liturgical unity of the Church. They see adoption of the papal calendar as part of a programme to undermine Orthodox traditions and to reduce the Church to a position of equality with other religions.

Summary

Old Calendarists are those Orthodox Christians who continue to follow the Julian calendar, denying the validity of the Gregorian calendar which was introduced by pope Gregory XIII in 1582. The Gregorian reform was rejected by patriarch Jeremias II at the time and was not adopted by the Greek Orthodox Church until 1924. Divided into several synods, Old Calendarists in Greece today number perhaps 150,000.

Oligarchy

Rule by the "few"

Oligarchy ("rule by the few") was a fluid term that first emerged in 5th- and 4th-century BC Greek historical, political, and philosophical texts. In a precise context, oligarchy meant broad-based constitutional government by property owners of the Greek city states, who as exclusive citizens could both vote and hold office; but in a wider sense, oligarchs came to be identified as any group who, whether through legal means or by force, sought to check the power of democracy.

Government during the later Mycenaean period (1600–1200 BC) was dynastic, controlled by a king (*wanax*) who occupied a centralized fortified palace and its surrounding countryside. And while Linear B tablets reflect cadres of other high political officials, rule was clearly in the hands of a supreme chief who claimed power through inherited privileges.

Myths and stories found in later Greek literature give the impression that local chiefs (*basileis*) controlled tribal organizations during the Dark Ages (*c.*1200–700 BC). Powet was probably in the hands of a single individual, and was passed on to male children. Whereas there were obviously a select few local princes who consulted the king, most government was not constitutional, but based largely on the ability of local potentates to muster subservient shepherds and farmers into successful military bands.

The emergence of more than 1000 Greek city states in the 8th century BC ushered in the first period of truly constitutional government in the Mediterranean – local communities were now often represented by independent landowners who sought political power commensurate with their hoplite infantry prowess and agricultural expertise. Yet, this transition from aristocratic government to rule by property owners was not automatic, but often characterized by periods of autocracy, as transitional tyrants for two or three generations – most often in the commercial, seafaring states near the isthmus or in the islands – might wrest control from noble families in the purported interest of the common people. In some areas of Greece – Thessaly and Sparta are good examples – vestiges of monarchy, coupled with consulting bodies of aristocratic families and supported by serfdom, continued for centuries.

By 700 BC many poleis were beginning to establish governments by property-owning citizens, which might constitute a third to half of the resident native-born male population. Aristotle later called such constitutions either "polities" ("polis governments") or "timocracies" – rule by those who enjoyed influence, prestige, and property. In fact, such timocratic governments were moderately oligarchic, allowing small landholders to vote on legislation proposed by elected senior officials.

By the 5th century BC the rights to participate in the assembly and hold office were extended to the landless poor at a few cities – most notably Athens – as part of a slow liberalizing Panhellenic trend that would be characterized by office-holding by lot, public works, navies, urban fortifications, and subsidized pay for jury service and assembly attendance. During the rise of democracy in the 5th century, the definition of oligarchy crystallized as a reactionary alternative to more egalitarian constitutions, and the two words democracy ("power of the people") and oligarchy ("power of the few") first appeared in the Greek language and in clear antithesis to each other.

In reality, it was often difficult to calibrate whether a city state was oligarchic or democratic, since most had councils and elective officials. Aristotle later attempted, without much success, in book 4 of his *Politics* to create a typology of constitutions, characterized by four variants of both oligarchic and democratic government. But "the few" and "the people" were relative terms – some "oligarchic" states might have very low property qualifications and a high percentage of citizen participation, while the offices of nominally "democratic" constitutions could de facto be staffed exclusively by more prosperous landholders.

By the late 5th and 4th centuries, and especially during the Peloponnesian War (431–404 BC), oligarchy took on a far more precise definition: rule of those with capital and in alliance with Sparta. Thus the great revolutions at Corfu and elsewhere during the war were not marked so much by disagreements over the voting franchise or the constitution per se, as by strife among larger landowners and businessmen against those without money. The former welcomed the intervention of Spartan infantry to protect their interests, the latter looked to the Athenian fleet to champion the cause of the poor, who saw democracy not so much as voting privileges but rather as entitlements and subsidies for the landless. Indeed, Aristotle concluded that oligarchy had come to mean simply "rule by the rich", democracy "rule by the poor".

The defeat of Athens (404 BC) did not result in a spread of oligarchies championed by the victorious Spartans. Rather, the increasing monetarization of the Greek economy and the corruption of census rubrics brought on by the demands of the war led to a rise in democratic government. States in Boeotia and in the northern Peloponnese increasingly liberalized their constitutions to include participation by most native-born residents, and often gathered neighbouring communities into federal leagues under democratic auspices that would survive into Roman times. Coups by both radical and moderate oligarchs at Athens, Argos, and Mantineia were often short-lived. The harsh nature of Spartan hegemony, and the insular nature of Spartan society, did little to encourage a return among the city states to oligarchic rule.

Most Greek thinkers, themselves aristocrats, preferred moderate oligarchies, as consistent with the traditional values of the old agrarian polis, and a bulwark against the financial and cultural liberalism spawned by imperial Athens. Thucydides felt the brief rule of 5000 property owners at Athens in 411 was the best constitution in the history of the state. Aristotle lamented the passing of the rule of a middling agrarian population that had avoided the extremes of both reactionary autocracy and radical democracy. The so-called "Old Oligarch" – author of an anonymous 5th-century BC political tract – described the reckless dynamism of Athens largely in terms of its abandonment of traditional oligarchic restraint. Plato's political ideas are confusing; he clearly did not favour democracy but instead looked to government based on either natural or enforced hierarchies.

In the later 4th century BC the wealthy of the polis continued to yearn for government by the few, and now looked not to traditional oligarchies, but rather to the growth of

Macedonian monarchy. Philip II and his son Alexander the Great sought to subsidize wealthy politicians in the Greek city states, promising local autonomy to oligarchic cadres who could maintain order, provide tribute, and furnish manpower for the Macedonian cause. The successors of Alexander in both Greece and Asia Minor continued to favour such oligarchies, which were increasingly narrow groups of wealthy urban elites, often absentee owners of estates in the countryside. Class strife in the ancient world is largely a Hellenistic phenomenon, and was waged by those dispossessed farmers who increasingly became the urban unemployed or rural serfs, and now lacked both the freedom and the rights that had existed under traditional oligarchy.

The nomenclature of Hellenistic government as it survives in the histories and on inscriptions is confused and often euphemistic. It can be assumed that reference to "the people" and "the council" usually meant a select few, who governed under the aegis of monarchy and on the basis of vast wealth. While there were still democratic councils among the federated leagues in Achaea and Aetolia, most city states were increasingly governed by elites owing allegiance to kings. Gone was any traditional idea of oligarchy as the rule by a substantial landowning minority of the town's residents, who were responsible entirely for a community's defence, foreign policy, and financial health. Popular rule in the Hellenistic age simply meant for most cities control by the indigenous rich in service to a foreign monarchy. No local oligarchies in the Hellenistic age enjoyed real autonomy.

After the Roman conquest of Greece (146 BC), most Hellenic provinces were run by local oligarchic councils who reported to a Roman executive proconsul. While deliberations were often by consensus vote, and while the language of constitutional government might suggest popular assemblies, in fact foreign executives, backed by the legions, retained the real power. In general, the Romans found that local elite oligarchies ensured that taxes were promptly paid and social unrest minimal.

After the breakup of the western empire (5th century AD) Greek oligarchic councils continued to enforce the law of the emperor at Byzantium. The Turkish occupation changed little, as Greek aristocrats now managed affairs under Ottoman auspices. The basis of Greek constitutions during the 19th and 20th centuries was in theory democratic, but in fact characterized more by extended periods of autocracy as local dynasts, dictators, and generals seized power from elected assemblies. Following a practice established since Classical times, Greek officials, who distrusted popular assemblies and sought to rule by the advice and consent of a few wealthy men, used the nomenclature of democracy, not oligarchy. After the 5th century BC the term oligarchy would for ever describe reactionary autocracy and plutocracy rather than the original, more liberal Greek notion of simple majority rule by moderate property owners.

Olive

The olive is a fruit-bearing tree that is imbued with a symbolic meaning and a practical value that make it of pivotal importance to the understanding of everyday life in Greece, of the socioeconomic realities of the country, and of ritual practices, beliefs, and customs. The olive is the national tree of Greece, while olives and olive oil are its national products.

The olive is one of the oldest cultivated trees in the world. The Greeks were among the first to engage in its systematic cultivation, in the Early Bronze Age, that is in the 3rd millennium BC, though archaeological evidence reveals that olive-oil production started much later, in the Late Bronze Age. Its extraction was facilitated by the introduction of the lever press, which in various combinations remained in use up to the 20th century.

Olives constituted an important ingredient in the diet of the ancient Greeks. It has been suggested that a wealthy household would consume approximately 200–330 kg of olive oil per year. It had many uses, and in antiquity it was considered to be a "luxury product". It was first used as a perfume or as an essential substance in the production of perfumes and ointments for bodily care, probably because of its therapeutic and cleansing qualities. It was also often used as a means to heal maladies; Hippocrates, the father of medicine, suggested more than 60 uses of olive oil for healing purposes. From the 6th century BC onwards, olive oil was introduced to food and acquired great economic significance. At around the same time it was also increasingly used for lighting. Olive wood was employed for building and in the making of various artefacts. Occasionally olive kernels and wood were also used as fuel.

The olive tree is evergreen and is characterized by its longevity and durability. These three distinct characteristics earned it a central position in Greek religion. Moreover, its sacred symbolism was derived from the great economic importance of its fruits and their products. It is for this reason that the olive tree was considered to be the sacred tree of the goddess of wisdom, Athena, who was said to have created it on the Acropolis in her contest with the sea god Poseidon for the control of Attica. The olive branch was a symbol of peace and victory and at the Olympic Games olive wreaths adorned the heads of victors. Similarly, olive oil was given as a prize to the victorious athletes at the Panathenaic Games. Because of its

Olive: range of varieties for sale in an Athens market. The olive remains the most enduring material ingredient of Greek culture.

symbolic value olive oil was frequently also used for ritual purposes. It was used to smear bodies before burial, offered in the form of libation to the dead and the gods, and fed the lamps in the temples.

The uses of olive oil in the Orthodox Christian tradition were not new inventions, but they reflected these ancient and solidly consolidated practices. Its symbolism was enhanced by the similarity of the Greek word for oil – *elaion* – to *eleos*, meaning "mercy". It thus symbolized God's mercy and grace and was used in the sacrament of unction for the anointing of the sick and for the forgiveness of sins. In liturgical practice oil was used for various kinds of anointing. It is the basic substance of the "chrism" used in baptism, confirmation, and holy orders. From the 7th century onwards coronation ceremonies involved anointing with oil. Olive oil is also used for the oil lamps that burn in front of icons, and many Greek Orthodox today, seeking miraculous healing, use this sanctified oil to anoint themselves. Due to its association with the strengthening of the body, in strict periods of fasting the Greek Orthodox abstain from oil, but not from olives, which are probably one of the most widely consumed food substances during fasts. Finally, olive oil of the best quality is often offered by the faithful to the church as a gift to the saints and to God.

According to historians, in the 12th century more olives were produced in the southern Peloponnese than anywhere else in the world. In the late Middle Ages, however, there is evidence that the systematic cultivation of olive trees was restricted, particularly in the main olive-producing areas of Greece, such as Crete. This was probably due to the unstable political and socioeconomic conditions, and to the prevalence of cereal and vine cultivation. Moreover, the development of stock raising in this period resulted in the replacement of olive oil by pig fat in food and in lighting.

During the period of Ottoman rule, expropriation of land and high taxes prevented any increase in the production of olive oil. It still remained a luxury product because of its high price, and its consumption was governed by strict economic restrictions, reflecting the social divisions of the day. By contrast, raw olives with bread occupied a central place in the nutritional diet of peasants, farm labourers, and of the poorer and middle classes of the Greek urban population.

The olive fruit and olive oil became important factors for the economic development of the newly founded Greek state. Olive groves owned by Turks passed to state ownership and, eventually, to private ownership for a price. Thus in the 19th and 20th centuries there was a noticeable rise in olive plantings and increased production of olives and olive oil. From that time onwards, olive cultivation became one of the most significant sources of income from the agricultural sector of the Greek economy. Just before World War II modern oil-processing factories were installed, which not only resulted in increased production of oil for domestic consumption but also for exports.

Olive trees with vines and citrus trees provide the arboricultural character of Greece today. Olive groves exist in most parts of Greece, since the trees can be grown in poor soil and on rocky terrain with little irrigation. The warmer and drier areas favour the production of olive oil, while the cooler areas favour the production of raw olives. Olives cover 17 per cent of the Greek cultivated land. There are more than 120 million olive trees, of which 95 million are used for the production of oil. The average annual production of olive oil is 250,000 tons. Crete produces the greatest quantity of olive oil (30 per cent), followed by the Peloponnese (26 per cent), Lesbos (10 per cent), and the Ionian islands (8 per cent); 450,000 Greek families are engaged in olive cultivation and the average annual consumption of olive oil is 18.5 kg per head, the greatest in Europe.

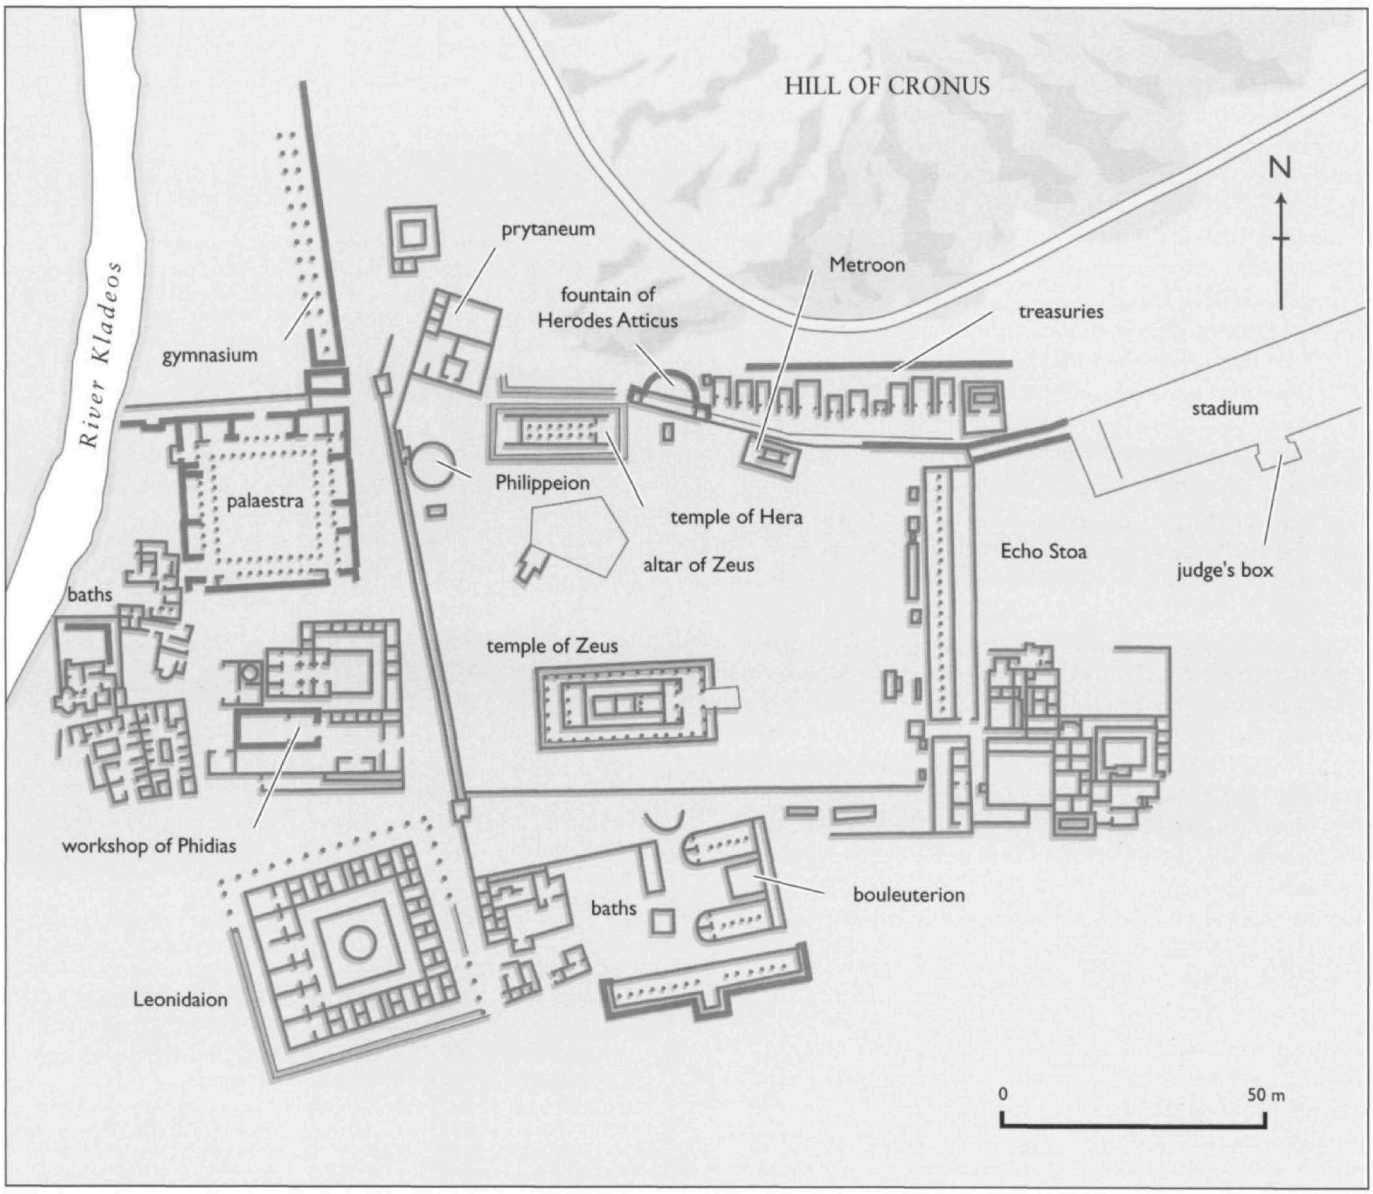
Olympia

Sanctuary in the Peloponnese

Olympia is situated in a valley at the confluence of the Alpheus and Cladeus rivers in Elis in the northwest of the Peloponnese. It attracted not only pilgrims and athletes to the sanctuary, but developed into a kind of fairground for traders, artists, and literary figures. Olympia at the time of the festival was said to be crowded, hot, noisy, and full of flies. There was a taboo against females, certainly married women, from participating in the festival. Girls, however, had their own festival there called the Heraia. The importance of Olympia, an otherwise insignificant place, may lie in its association with the cult of Zeus. Strabo also records that its reputation came from its oracle of the Earth Goddess.

The site was not identified during the Middle Ages, but was discovered by Chandler in 1766, albeit covered with some 4 m of alluvium from the changing courses of the rivers. French archaeologists under Maison started digging in 1829 and removed to the Louvre some of the metopes from the temple of Zeus. The later school of German archaeologists to work on



27. Olympia

this site include Curtius, Dörpfeld, Furtwängler, Kunze, Mallwitz, and Sinn. Many recent discoveries are changing traditional ideas about Olympia, especially dating.

The traditional belief is that there are Mycenaean remains as early as 1500 BC, that the first shrine to Zeus was built about 1000 BC, that athletics were first recorded in 776 BC, and that the games ended in AD 393 with the edict of the Christian emperor Theodosius I. Mallwitz, however, has argued that there is no convincing evidence for a Mycenaean sanctuary, but that Olympia became a sanctuary first in the 9th or 8th century BC and that athletics came later. The foundation date of 776 BC for the games is derived from the lost victory list of Hippias of Elis, but the archaeological evidence of the site, especially the appearance of wells in the eastern part near the stadium at the end of the 8th century BC, may point to a date closer to 700 BC. Recent inscriptions with the names of victors show that the games were still going strong in the 3rd and 4th centuries AD. Coins and other finds in the stadium seem to suggest that the games extended for at least a century longer than the traditional closing of AD 393, and that Christianity, far from destroying pagan cults, existed side by side with them.

The Altis was the walled, sacred area, a grove consisting largely of plane and olive trees. The chief shrine there was the great altar of Zeus, said to be 7 m high, but Olympia was not dedicated to Zeus alone, for Pausanias (5. 14. 4–10) records more than 70 altars in the Altis, although most of them are not directly connected to Zeus and the games, and very few of them can be located with any accuracy. The oldest shrine was that of Pelops. The major buildings in the historical period included the temple of Zeus, the temple of Hera, the precinct of the Earth Goddess, the precinct of Pelops, and the 12 treasuries, which were used by the city states as "bank vaults" and for the display of wealth. Outside the Altis *inter alia* were the council chamber for the Hellanodikai (officials and judges), the workshop of Phidias, and primitive bathing places. In the 4th century BC were added the Metroon, the Echo portico separat-

ing the Altis from the stadium, the Phillipeion erected by Philip II of Macedon (showing the political importance of Olympia), and outside the Altis the Leonidaion (the guest house) and southern portico. In the Hellenistic period the triumphal archway into the stadium from the Altis was built. Several baths date from the Roman period, as the site became more developed. A good water system was made possible by Herodes Atticus in the 2nd century AD with the construction of the monumental fountain known as the nymphaeum. A Christian basilica was built on the foundations of the workshop of Phidias. Other buildings are being discovered including the clubhouse in the southwestern corner of the site. The Altis was also used as a "Hall of Fame", where victorious athletes were allowed to set up statues of themselves. Bases of statues of Zeus (Zanes) were erected at the foot of the Hill of Cronus at the expense of athletes who had cheated.

Traces of three stadia remain to the east of the Altis on approximately the same site, a flat area at the foot of the Hill of Cronus. Stadium I was partly within the Altis and dates from the Archaic period, though little is known about it. Stadium II, dating from the late 6th century BC, had artificial embankments for spectators on the north and south. Stadium III was more elaborate and was located about 75 m to the east with additional embankments on the east and west together with a judges' box. The altar of Demeter can still be seen in the stadium. The palaestra and gymnasium were added in the Hellenistic period, but it has recently been suggested that the gymnasium was used not for athletic training, but for cultural purposes. Nothing remains of the hippodrome, although its location between the stadium and the Alpheus river, the elaborate starting device in the shape of the prow of a ship, and other features are known from Pausanias (6. 20. 10–19).

The most famous work of art, the monumental statue of *Zeus* (more than 13 m high) was made of gold and ivory by Phidias, and was considered one of the seven wonders of the ancient world. It stood in the entrance to the Doric temple of Zeus built by Libon, but no longer survives, having been transported to Constantinople in the 4th century AD, where it was destroyed by fire. The museum sculptures include the pediments and metopes of the temple of Zeus, the colossal head of Hera, the *Nike* of Paeonius, the *Hermes* of Praxiteles, clay sculptures of the head of Athena and of Ganymede and Zeus, thousands of bronze statuettes, bronze sheets with reliefs, and various bronze weapons, architectural bronzes, and tripods (the most common votive offering at Olympia).

Olympia was partly destroyed by the invasion of the Heruli in the 3rd century AD and the later invasions of the Slavs. An earthquake in the 6th century destroyed the temple of Zeus and other buildings. The changing courses of the Alpheus and Cladeus have covered parts of the site, especially the hippodrome (still unexcavated). Today Olympia is a tourist attraction, with a museum area (originally founded in 1886, but now a modern building). The stadium, as we now see it, is based on the stadium as it was thought to be in the 2nd century AD, with start and finish lines visible about 200 m apart. It remains unimpressive to look at (by comparison with the stadium at Delphi) with grassy banks, dusty track, and no seats for spectators (as it probably was originally), and is totally unsuitable for modern sports. For every modern Olympiad the Olympic torch is ritually lit at the site of ancient Olympia.

Summary

Located in the northwestern Peloponnese, Olympia is associated with the cult of Zeus. It probably first became a sanctuary in the 9th or 8th century BC. The festival of athletics (traditionally dated to 776 BC) may not have begun much before 700. Finds suggest that it continued well into the 5th century AD (beyond the traditional closing date of AD 393). Many buildings were destroyed by earthquake in the 6th century AD.

Olympic Games

The Olympic Games were the principal athletic games in the ancient world. First recorded in 776 BC, they were banned in

AD 393, but survived in some form until the early 6th century, and were revived as a global event in 1896.

Greek myth attributes the establishment of the Olympic Games to the Idaean Dactyls, the iron-working attendants of the mother goddess Adrasteia who are identified with the guardians of the infant Zeus, to Heracles, and to Pelops in celebration of his conquest of Oenomaus in a chariot race. The traditional date for their establishment in 776 BC may, therefore, indicate merely a revival, but nothing is known of their possible earlier history. They were held at Olympia, a sanctuary named for the presiding deity Zeus Olympios (i.e. of Mount Olympus). Although there is evidence at Olympia, in the western Peloponnese, for habitation from the Early Helladic period, in the Archaic, Classical, Hellenistic, and Roman periods it was only a sacred site (the altis) with an associated stadium and an increasing number of buildings for administration, training, and lodging. It was first under local Pisatan and from *c.*470 BC under Elean control.

In 776 BC the games consisted of no more than the stade race with athletes drawn from the surrounding area, the inaugural winner being traditionally a local baker, Coroebus. Other athletic events were added in the late 8th century BC, equestrian and boys' events in the 7th century BC, and further additions followed, including competitions for trumpeters and heralds in 396 BC. Many of the early victors were Spartan, but by the 6th century BC the games were truly Panhellenic, competitors travelling from all the Greek-speaking areas of the world and especially from southern Italy and Sicily. The games grew also in duration, from one day to six days in the Classical period. During the Hellenistic period there was no lessening of popularity, as Hellenistic monarchs vied with each other to add new buildings. Although the Roman conquest initially involved a vast diminution in the games' prestige, they now become open to at least some non-Greeks (the last known victor, of boxing in AD 369, was Varazdates, the crown prince of Armenia). In the late 1st century BC, however, king Herod of Judaea became president of the games and by a huge endowment encouraged a revival that was continued by subsequent imperial patronage: Augustus' right-hand man Agrippa repaired the temple of Zeus and both Tiberius and Germanicus won chariot races, while at games postponed for his own convenience (held probably in AD 67) Nero competed in and fraudulently won various events (including chariot racing and some unique musical and literary competitions). Still very popular in the 2nd century AD, the games suffered during the uncertainty of the following century and the sanctuary had to be fortified *c.* AD 268 because of the threat of the marauding Heruli. Held every four years without intermission from 776 BC until AD 261, they may possibly have been held only sporadically thereafter. Despite St Paul's enthusiasm for athletics, the games' combination of nudity and paganism must have made the growing number of Christians agree with the words of St Cyprian: "True Christians must shun with eyes and ears those vapid, dangerous, tasteless performances." They certainly would have come under the ban of the edict of Theodosius I in AD 393 that closed pagan cults and sites, but archaeological evidence suggests use of the stadium at Olympia until the early 6th century, and in some form they continued at Daphne, near Antioch, until AD 521.

Through most of their history they were the premier athletic festival. Next in rank were the Pythian Games, held quadrennially at Delphi in honour of Apollo and including many musical competitions, and the other two "crown games", the Nemean and the Isthmian, both held biennially in honour of Zeus and Poseidon respectively. The Olympic Games furthermore served as a model for many other festivals, some of which proudly proclaimed themselves "isolympic".

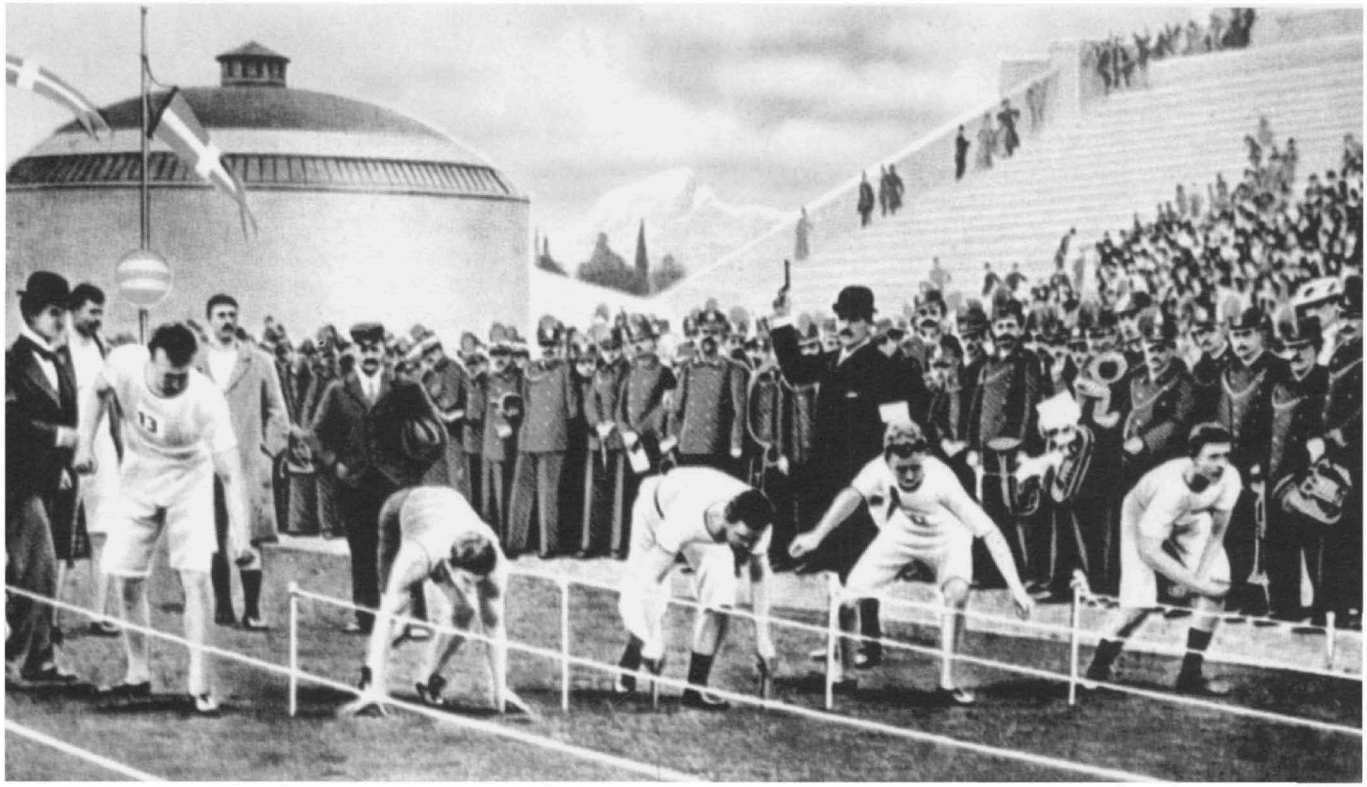
In the Classical period the first day of the celebrations was probably devoted to sacrifices, prayers, oath taking, and the checking of qualifications. Competition began on the second day. The sacrifice of 100 oxen (hecatomb) was the religious highlight of the third day, and the sixth day ended with further sacrifices and a celebratory banquet for the victors. In addition to the athletic competitions the festival gave visitors a huge fair with a wide array of entertainers, hucksters, and pickpockets.

Before the games Elean heralds proclaimed the Olympic Truce: this demanded safe conduct for all competitors and spectators travelling to and from Olympia and forbade any state to make war against the Eleans. Politics did, however, still intrude into the games, as Pheidon, tyrant of Argos, temporarily took over their organization in the early 7th century BC, and the Spartans turned the celebration of 428 BC into an anti-Athenian demonstration, while being themselves debarred from participation in 420 BC for their refusal to pay the fine imposed by Olympic law for attacking an Elean fortress.

Women, but according to Pausanias not girls, were banned even as spectators since athletes competed nude (there were separate games for girls held at Olympia in honour of Hera, but documentation is sparse). Athletes were required to train at home for at least ten months prior to the games, and during the 30 days of practising at Elis the poorest were weeded out by the judges since only the best would not do dishonour to Zeus. Judges were all Pisatan and later Elean and famous for their impartiality. Infringements of the rules for events resulted in beatings on the spot, disqualifications, and fines, the last of which were spent on statues (*Zanes*) erected in the sanctuary to give warning to others. Although prizes were merely garlands of wild olive, victors were generally richly rewarded by their home states. Since they could also win valuable prizes in kind and, increasingly in the Hellenistic period, monetary prizes at minor festivals, many were undoubtedly professional. Paid trainers became common from the 5th century BC and by *c.*50 BC athletes had formed their own trade union.

With the publication by the historian Timaeus, *c.*300 BC, of a synchronic list of Olympic victors (*Olympionikai*) the practice arose of dating other events by the Olympic quadrennia, Eratosthenes adding the refinement of subdivision into individual years (e.g. summer 774 to summer 773 BC is the third year of the first Olympiad). Despite problems of equating this system with the bewildering variety of other dating systems known in the Classical world, it survived well into the Byzantine period.

The first modern figure interested in a revival of the ancient games seems to have been Gustav Schartau, who held the *Jeux Olympiques Scandinaves* in Sweden in 1834 and 1836, but these were for winter sports. More serious revivals began in England and Greece. William Penny Brookes, a physician of Much Wenlock in Shropshire, established in 1850 his Annual Wenlock Olympian Games, which have since been held most years up to the present. These emphasized athletic events, but included also other games such as cricket, association football,



Olympic Games: starting line of the 100 m sprint at the first modern Olympic Games, Athens, 1896

and quoits. Other Olympic Games sprang up in imitation elsewhere in England (four already by 1870). In Greece the poet Panagiotis Soutsos first suggested a revival in 1835, but it was not until 1859 that, with money from the millionaire Evangelis Zappas, his efforts reached fruition in Panhellenic games which were held in what is now Athens' Plateia Koumoundourou; and even then governmental interference resulted in athletics being overshadowed by displays of industry, agriculture, and animal husbandry. The Zappas Games were held sporadically until 1889.

International Olympic Games are due to the vision of the Frenchman, Pierre, Baron de Coubertin. His original impulse came from reading Thomas Hughes's *Tom Brown's School Days* in 1875 and Hippolyte Taine's *Notes sur l'Angleterre*, whose remarks on English education suggested to him that an introduction of ball-games into the French educational system might enable the youth of his country to compete with the Prussians, who had made *Turnen* (gymnastics) a vital part of their curriculum. Becoming less chauvinistic, being increasingly in touch with Brookes, and, ironically, being inspired by the German excavations of ancient Olympia between 1875 and 1881, he conceived the idea of Olympic Games with athletics at their centre being held every four years, as in antiquity, but open to nationals of every country and held at different sites to promote the idea of world peace. In June 1894 he convened an international congress in Paris, at which the body that came to be the International Olympic Committee (IOC) was formed, under the presidency of the Greek Demetrios Vikelas, and the decision taken (after, it seems, some clandestine negotiations) to hold the first modern Olympic Games in 1896 at Athens (instead of London, the choice of the majority of delegates). The games were duly held in the ancient and now reconstructed Panathenaic Stadium, but, eschewing a mere antiquarian revival, they included such events as cycling, fencing, and lawn tennis and rewarded with medals the first three competitors rather than, with a vegetal crown, only the winner.

Summer games have been held quadrennially since 1896, but, unlike in antiquity, there have already been cancellations due to war (3 out of the first 13, which have, however, all been counted in the numbering of the Olympiads). Figure skating featured in the games of 1908 and various winter sports events were held in 1920, though not sanctioned by the IOC, but from 1924 to 1992 official winter games were held quadrennially (apart from the cancelled celebrations of 1940 and 1944) in the same year as the summer games: thereafter winter games were held in 1994 and 1998 and have been scheduled to take place in the future quadrennially between the summer games. Equestrian events have been part of the summer games in 1900 and since 1912, but in 1956 were held separately (at Stockholm rather than Melbourne). From 1912 to 1948 medals were awarded for different categories of architecture, literature, music, painting, sculpture, and even "Merit for Aeronautics" (one gold) and "Merit for Alpinism" (three gold). Although women first competed when a Greek unofficially joined the marathon for most of its course in 1896, they did not appear in appreciable numbers until the 1920s, partly because of de Coubertin who claimed, as late as 1935, that "their role should be chiefly, as in the ancient games, to crown the victors". About 245 representatives from 14 nations took part at Athens in 1896, since when numbers have grown, to more than 10,000 from 197 nations in 1996. Britain is the only

country that has not failed to send representatives to all the modern Olympic Games, including the irregular ones, since 1896 (Greeks did not participate in the winter games until 1936). The exclusion of professional athletes began to break down in 1962. Its practice had been due to both the mores of the times and the misconception that all ancient Olympic athletes had been amateurs.

All events at the first celebration in Athens were individual except for tennis doubles and gymnastic "teams" (rowing was cancelled due to rough seas), but association football, cricket, croquet, polo, rugby union, water polo, and the tug-of-war were introduced in 1900. Thereafter many sports and events have been included, as part of the official programme and as "exhibition sports", and many have been discontinued. Achievements by Greek nationals have been modest. With the exclusion of the poorly attended intercalated games at Athens in 1906, Greeks had won up to 1998 a total of 21 gold (including one in sculpture) and 60 other medals. Of these only one, a gold, has been won by a woman and none at the winter games.

The only ceremonial features of the modern games to have any ancient forerunners are the Olympic oath and flame. The latter is a deliberate reminiscence of the flame on the altar of Zeus that burned during the ancient festival and of ancient torch-relays, which were in fact more cultic than sporting: it was introduced in 1928 and first kindled at Olympia and brought to the site of the games by a relay of runners in 1936. De Coubertin is responsible for establishing the Olympic motto, creed, flag, and oath. The motto, "citius, altius, fortius" ("faster, higher, and more strongly"), he adopted from a Parisian schoolmaster, Father Didon, in one of whose schools the words are inscribed over the main entrance. The creed, emphasizing, in complete contrast to the ancient Greeks, that participation is more important than victory, de Coubertin claimed came from a sermon by Ethelbert Talbot, bishop of Central Pennsylvania, that was delivered in St Paul's Cathedral at the time of the games in 1908, but its wording is more probably the baron's own remembrance of a passage in Ovid's *Metamorphoses* (9. 5–6), whose context is erotic. The flag with its five interlocking rings dates from 1914 and was probably inspired by the two rings that symbolized the union of two French athletic associations: de Coubertin intended the six colours to represent the flags of the nations that had competed in the five games so far held (this, rather than continents, probably explains also the number of rings). The oath was devised by de Coubertin for the games in 1920.

Among the incalculable influences of the Greeks in the modern world the Olympic Games are probably the one of which the general public is the most aware.

Olympus, Mount

Mountain in Thessaly

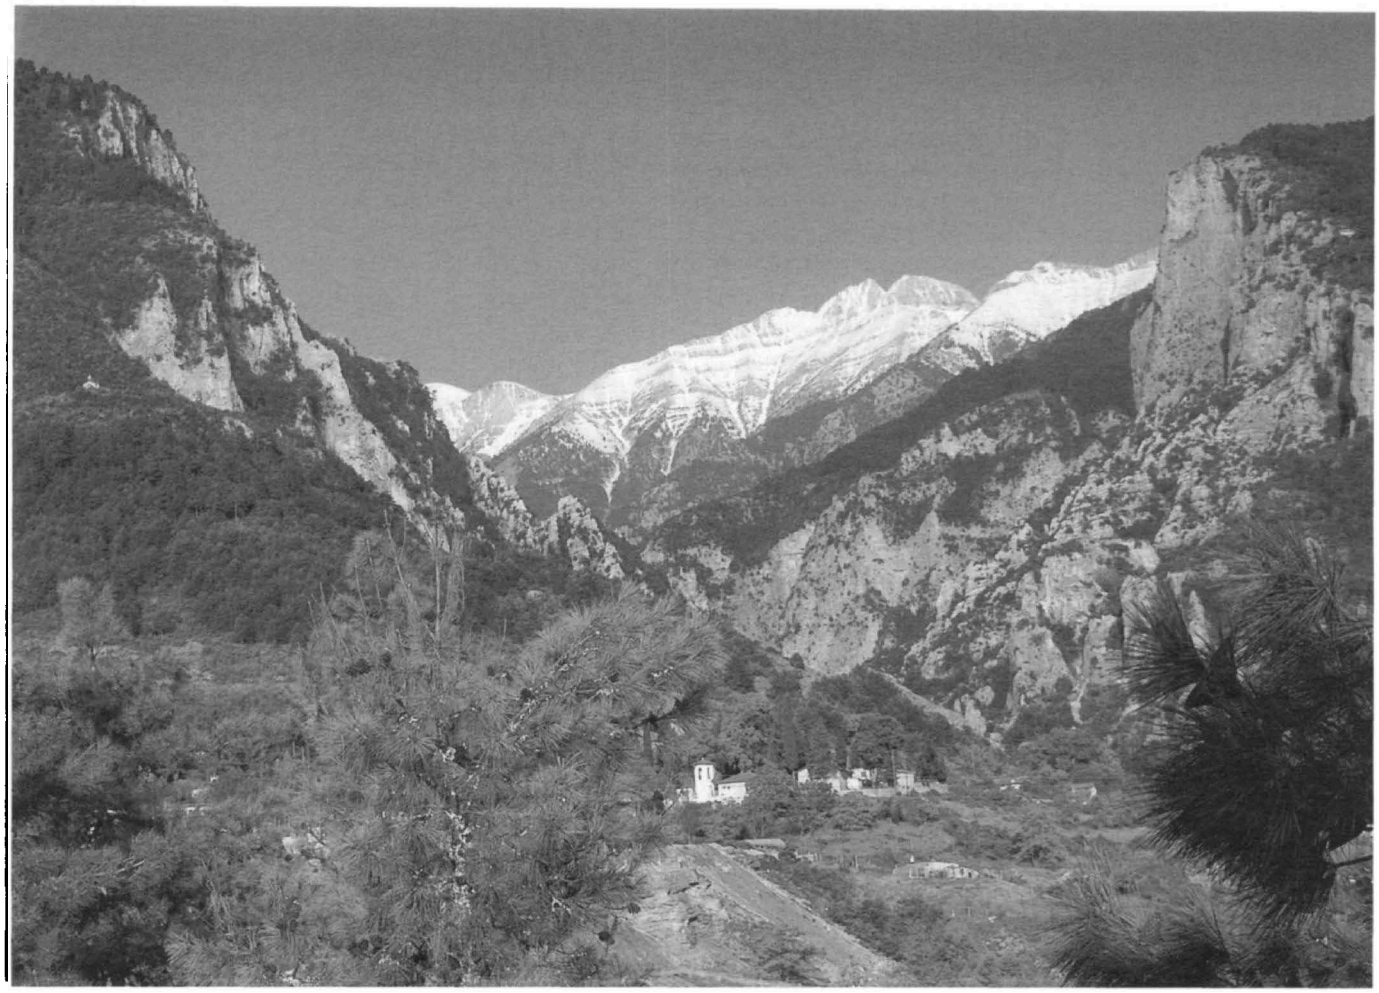
Olympus is the highest mountain in Greece and the second highest in the Balkan peninsula. It bears the ancient name "Thessalian Olympus" and is the deified mountain bridging Thessaly and Macedonia. It occupies the northeastern part of Thessaly and the southwestern end of central Macedonia, and straddles the boundaries of the counties of Larissa (province of Elasson) and Pieria. The mountain is shaped like a vault, having at its peak a plateau, from which other peaks rise by more than 2500 m. Above a gorge, some 600 m deep, the peaks rise of Mytikas or Pantheon (2,917 m), Stefani or the Throne of Zeus (2,909 m), Skala (2,866 m), and Scholio (2,911 m), forming a semicircle.

Olympus is a large mountain covering a relatively small area. Its width from east to west is no more than 25 km, from north to south 28.5 km, its perimeter 150 km, and its area 500 sq km. It is distinguished by its pointed peaks, its lengthy ridges, and its steep slopes that are traversed by deep gorges. Its main body, known as High or Upper Olympus, is distinguished from Lower Olympus (of which some specialists consider it to be a part) by the stream of Ziliana, the plain of Carya, and the river Elassonitiko.

The rock consists mainly of limestones and dolomites. From the streams that run down the mountain slopes only one has water throughout the year, the river Enipeas that passes through Litochoro; the rest are seasonal. The vegetation is limited. Typically alpine at 2,000 m and above, the lower zone is covered by forests, which in the higher regions consist of fir trees and in the lower of pines. The eastern side has more forests than the western. More than 1,700 plants have been registered in the area, i.e. about 25 per cent of the entire Greek flora. The fauna does not present any particular features. Some 32 different species of mammals have been identified as well as 108 bird species, while the mountain is famous for its many kinds of butterflies. In antiquity Pausanias reported the existence of lions on Olympus.

The climatic conditions are highly variable. At the foot of the mountain the climate is typically Mediterranean, while the northern and eastern slopes have greater rainfall. Average temperatures range from 0° to 20° C in the summer, and in the winter from -20° to +10° C. The mountain is covered by snow for about seven months of the year, usually from November to May.

Historically Olympus has been the target of various expeditions and was known as an ideal place for hunting (e.g. by



Mount Olympus, with several peaks over 2900m, is the highest mountain in Greece, seen here from the east

Sultan Mehmet IV). The botanists Theodor von Heldreich and Theodoros Orphanidis carried out a great deal of research on Olympus in the 19th century, while one ambitious expedition was undertaken by the German geographer H. Barth. In 1937 the first National Greek Forest Area was established on Olympus in order to protect the geomorphology, the fauna, and the flora of the mountain. Since 1981 this protected area has been incorporated in the "Programme on Man and the Biosphere" of UNESCO.

In ancient Greek mythology Olympus was considered to be the sacred mountain of Greece. After the victory of Zeus over the Titans, it came under the control of Zeus and became the home of the Olympian gods. Zeus' throne was believed to be at the highest peak, while the other gods resided on the surrounding ones. The mountain was also connected with Orpheus, who taught the Orphic mysteries and died there. It was also dedicated to the Olympian or Pierian Muses.

The name "Olympus" appears for the first time in the Orphic texts and is subsequently mentioned as such by all ancient Greek writers. It is generally held to be derived from a name used by the Aeolians, who lived on the western and southern shores of Asia Minor, and dates back to 1800 BC. The etymology of the word is uncertain.

Olympus was of great symbolic importance to the ancient Greeks. As the home of the gods, it symbolized immortality, high honour, and ideals. The epithet "Olympian" was given primarily to Zeus and thus signified grandeur and godliness. It occupied a central position in ancient Greek religion and cosmology, was connected with a specific philosophical world-view and attitude towards the world. The Olympian gods were the symbols of a particular *Weltanschauung*, which permeated ancient Greek culture as a whole. It is no wonder that, according to one view, while Delphi represented the *omphalos* (navel) of the earth, Olympus constituted its head (= mind).

In historical times the regions around Olympus were populated by various Greek tribes. Its mountainous routes were of the utmost importance during military expeditions, ranging from the period of the Persian Wars to the Roman conquest of Greece. At the foot of the mountain several significant cities were founded, including Dion and Pythion. The first human settlement on Olympus must have been established around 1000 BC near Hagios Vasileios and Mesonisi, where several tombs have been uncovered dating from 1000 to 700 BC. Further archaeological excavations and topographical research have unearthed numerous inscriptions, coins, and artefacts from various historical periods that point to relations with both Thessaly and Macedonia.

The great mythical value of Olympus has left an indelible impact upon the popular consciousness of the Greeks, who still consider it a majestic place. Olympus is also considered the

focal point at which ancient Greece meets modern Hellenism. Many legends have been created about the peak of Olympus touching the sky and therefore the divine. Numerous popular songs have been composed praising the mountain. Under Ottoman rule Olympus became the hiding place of many klephts and *armatoloi* and was extolled in demotic traditions. During the Greek War of Independence it was also a place where various military operations took place.

The location of Olympus almost at the centre of Greece has created an idiosyncratic system of socio-economic dependences. Up to the beginning of the 18th century its position in the economic life of the country was of no particular importance, but under later Ottoman rule it functioned as the guardian of Greek sociocultural traditions that remained untouched by foreign influences. While many villages have been depopulated due to the unfavourable conditions obtaining in the Greek countryside, the villages on or around Olympus retained their populations because of the various economic opportunities on the mountain. From the latter half of the 18th century onwards, there was a noticeable economic development in the area, due to the establishment of commercial ties between Thessaly and the greater Balkan area as well as Central Europe, which transformed the inhabitants of Olympus into the main bearers of commerce in central Greece. This financial prosperity went hand in hand with significant cultural developments, since many schools, libraries, wealthy mansions, churches, and monasteries were established around the mountain. Even today the greater Olympus area remains an important centre of various economic and cultural activities, and therefore a considerable tourist attraction.

NEKTARIOS DROSOS

Summary

The highest mountain in Greece (2917 m), Olympus lies on the borders of Thessaly and Macedonia. In mythology it was the home of the gods, and Zeus occupied the highest peak. It still has many legendary associations. During the Tourkokratia it preserved many Greek cultural traditions. In the War of Independence it was a focal point for banditry.

Olynthus

City in Chalcidice

Olynthus was located at the head of the Cassandra gulf on the Chalcidice peninsula, approximately 4 km inland from the sea. It was built on two flat-topped hills rising about 30–40 m above the surrounding plain. According to mythology, the city was named after Olynthus, a son of Heracles and Volve. Another myth refers to Olynthus as a son of the king of Thrace, Strymonas, who was killed during a lion hunt. Thus, Vraggas built the city of Olynthus to honour his brother's memory. The ending of the word Olynthus implies a pre-Hellenic provenance for it. Although the location of the city has been known since the 19th century, it was in the 1920s and 1930s that extensive excavations were carried out by the American Archaeological Mission led by David M. Robinson. The destruction of Olynthus in the mid-4th century BC has preserved a full ground plan as well as individual details of housing, providing unique information for the Classical Greek city.

In the Neolithic period a small settlement was established on the south hill of Olynthus, but Bronze Age remains are lacking. Occupation begins in about the 7th century BC. Herodotus (8. 127) and Thucydides (2. 99) reported that around 650 BC the district was inhabited by the Bottiaeans, a Thracian tribe, under whose rule the city of Olynthus remained until 479 BC. Together with other towns in the area, Olynthus supplied troops and ships to Xerxes in 480 BC, while during the Persian retreat from Greece (479 BC) Artabazus besieged and captured the city, suspecting a revolt. He then slaughtered its inhabitants and handed Olynthus over to Critobulus of Torone. Around that time new settlers from nearby Chalcidian communities immigrated to Olynthus, which thus became a Chalcidian city.

By the mid-5th century BC Olynthus was a relatively small city. As a member of the Delian League, it paid on average 2 talents of tribute from 454 to 432 BC, much less than other neighbouring Chalcidian cities (e.g. Scione paid 9, Mende paid 8, Torone paid 6). The archaeological remains from this period down to the last third of the 5th century BC are exclusively concentrated on the south hill. Two streets ran roughly north–south along the east and west sides of the hill separated from the brow by one or two rows of rooms. Two cross-streets running east–west have also been excavated, while public buildings were located at the north end of the hill. Moreover, a section of the fortification wall was uncovered in this area.

In 432 BC, facing Athenian aggression, Perdiccas, king of Macedonia, persuaded the inhabitants of a number of coastal Chalcidian cities to move inland to Olynthus and to form a single fortified city (Thucydides, 1. 58). This moving up (*anoikismos*) is thought to have given the impetus for the expansion of the old city of Olynthus to the flat-topped hill to the north, and for the laying out of a new grid-planned section of the city there. Olynthus thus became the chief city west of the Strymon and revolted against Athens.

The north hill was not inhabited until the *anoikismos* of 432 BC. This area, measuring 600 × 350 m, was laid out on an orthogonal plan, according to the Hippodamian town-planning system, with a few irregularities. Seven parallel "avenues"

5–7 m wide, running from north to south, were traversed by streets 5 m wide. Each of the blocks thus formed was 35.40 ¥ 86.34 m and usually included ten houses, grouped in two rows of five separated by a narrow alley. On the east side of the hill, however, the blocks were shortened to allow the roads to follow the topography of the hill.

The population of Olynthus numbered 15,000 inhabitants at the end of the 5th century BC. The houses at Olynthus, sometimes two-storeyed, were grouped around an open courtyard, with rooms on two or more sides. As in most ancient Greek houses, the courtyard was located in the southern part of the house with the portico and the main rooms to the north. The rooms had earth floors, unplastered walls, and very few or no features specifying their function. The houses at Olynthus are modest, lacking large common areas; exceptional are a few "villas" with mosaic floors which stood on the southeast slope of the hill (e.g. the Villa of Good Fortune, the House of the Comedian). Public buildings have been excavated both on the south and the north hills. The agora (marketplace) of Olynthus was located on the west side of the north hill and consisted of an open plaza (85 × 130 m), a stoa with shops, a building with a central colonnade (*bouleuterion*), and a fountain house. The three cemeteries of Olynthus were situated outside the city walls.

The city was fortified by a brick wall against which the first row of houses rested. Originally the city wall followed the contour of the hill. However, during the course of the 4th century BC, the city expanded to the east, creating a new suburb down on the plain. The agora occupied a free space where the old and the new settlements met.

The establishment of the Chalcidian League – a political union of certain cities of Chalcidice under the leadership of Olynthus – in 423 BC contributed substantially to the further development of the city. Following the end of the Peloponnesian War the development of the league was rapid. Around 390 BC it concluded a treaty with Amyntas, king of Macedonia, and by 382 it had extended its domination over the majority of Greek cities west of the Strymon and had even taken possession of Pella (Xenophon, *Hellenica*, 5. 2. 12). The league also issued its own coinage. In 382 BC Sparta was persuaded by an embassy from Acanthus and Apollonia, which was threatened by the rapid growth of the league, to send an expedition against Olynthus. Three years later (379 BC) the Lacedaemonians invaded Olynthus and the confederacy was dissolved. After the demise of Sparta, however, Olynthus re-established a league with 32 cities and became very powerful.

When the war between Athens and Philip II broke out in 357 BC, both powers sued for alliance with the league. Olynthus was at first in alliance with Philip, who offered the fertile region of Mygdonia as well as Potidaea to the Chalcidian League (356 BC). Subsequently, alarmed at the growth of his power, the Olynthians dissolved their alliance with the Macedonians and concluded an alliance with Athens (352 BC). Philip used as a pretext the Olynthians' refusal to hand over his brothers Arrhidaeus and Menelaus, who had taken refuge in their city, and razed Olynthus to the ground and sold the people into slavery for having broken their oath as his allies (348 BC). Demosthenes, the Athenian orator, delivered three Olynthiac speeches, urging Athens to send forces to protect Chalcidice. By the time the Athenian fleet reached Chalcidice, Olynthus and other cities of the Chalcidian League were being besieged. Olynthus was partially reoccupied after 348 BC, but a few years later most of the survivors were sent by Cassander to settle in Cassandreia in 315 BC.

ELENI ZIMI

Summary

A city in Chalcidice about 4 km from the sea, Olynthus was occupied from the 7th century BC and was ruled by the Bottiaeans until 479 BC. Its inhabitants were slain by the retreating Persians and the city was resettled as a Chalcidian colony and member of the Delian League. Perdiccas of Macedon in 432 BC persuaded the inhabitants of several neighbouring towns to move to Olynthus, thus increasing its size. From 423 it headed the Chalcidian League. In 348 BC it was destroyed by Philip II.

Onassis, Aristotle 1900 (or 1906)–1975

Shipowner

Aristotle Onassis is the most famous Greek shipowner of the 20th century. His name is synonymous with fame, wealth, and success; he is the archetype of the cosmopolitan, self-made, and talented entrepreneur. During the years when he dominated world shipping, from the mid-1940s to the mid-1970s, Onassis was a focus of publicity, often extravagantly presented by the world's mass media. His exuberant personality rendered him highly popular, a popularity that stemmed not only from his successful entrepreneurial activity, but also from his intense and glamorous private life.

Onassis was born the son of a tobacco merchant in the prosperous and cosmopolitan Greek community of Smyrna either in 1900 or 1906. The destruction of the city in September 1922 after the unsuccessful campaign of Greek forces in Asia Minor brought him to Greece along with hundreds of thousands of Greek refugees from the Ottoman lands. He stayed only one year in Athens before he followed the immigrant wave from the eastern Mediterranean to South America. Arriving in Argentina in 1923, he initially worked there as a telephone operator. His first business activity was related to his family business, and very soon he was importing tobacco from Greece; at the same time, he expanded his business in Buenos Aires, and soon produced cigarettes for women. Within a

decade he had accumulated enough capital to turn, in 1933, to shipping, an entrepreneurial interest that lasted until his death.

When Onassis bought his first two steamships from the London office of the Dracoulis brothers, world shipping (and consequently ship prices) were at rock-bottom levels. This was a time of negative growth rates in world shipping, with the exception of the Greeks, who took advantage of the crisis and bought ships when everybody else was selling. Consequently the Greek-owned fleet in the interwar period had become the second biggest tramp operator in the world after the British, carrying bulk cargoes between third countries. This was a fleet that had seen a continuous rise since the formation of the Greek state in the late 1820s. During this period traditional shipping families came mainly from five islands – Cephalonia, Ithaca, Andros, Chios, and Kassos – and kept chains of branch offices that stretched from the ports of the Black Sea to the main economic and shipping centre of the world, London. They formed an international and exclusive informal shipping "club". Up to World War I these shipping families carried grain from the Black Sea to western European ports, with coal as the main return cargo. The expansion to the Atlantic routes, on a more massive scale, took place during the war, when Greece was neutral and the closure of the Dardanelles meant the loss of the Black Sea grain cargoes. The sea route on which Greek shipping thrived, and in which it replaced the British fleet during the interwar period, was from Argentina to northern Europe; carrying cargoes of grain and returning cargoes from the UK with coal. Hundreds of Greek ships visited the river Plate during the 1920s and it was then that Onassis met Kostas Gratsos, an Ithacan from a traditional shipping family, and subsequently a close friend and collaborator. Following the tradition of Greek seafarers he named his first two ships after his parents: *Socrates Onassis* and *Penelope Onassis*. These were second-hand vessels, cargo steamships of Standard B type, built in 1919.

In Buenos Aires, however, Onassis learnt the practices not only of Greek shipowners but also of the Norwegians, the other big international tramp operators. Norwegian shipowners were involved in a new trade, oil, and the ships that carried it, tankers, and it was Onassis's insight that made him realize the potential of oil as the world's main energy source. In 1938 he ordered his first tanker in Gotnenburg and became the first Greek shipowner to enter this market. Various legal difficulties created by the Greek government of Metaxas in some European ports led him to hoist the Panamanian flag on this new tanker together with another ship of his fleet (the Panamanian flag was already used by other traditional shipowners such as Kulukundis). The advantages of this decision were evident within two years. The outbreak of World War II found Onassis's ships under flags of countries that remained neutral. Hoisting the flags of Panama and Sweden, his ships were free to travel anywhere and could earn high profits, since transportation needs were very great during the war.

The earnings that came from the operation of the fleet during the war formed the basis of his post-war development. If his ships had been under the Greek flag they would have been requisitioned by the Greek government and the responsibility for their operation would have been taken over by the Allied forces, as happened with the Greek-flag ships. Onassis was one of the few who could exploit the opportunities offered by neutrality during the war. His involvement in shipping convinced Onassis that Buenos Aires was no longer the best place to be, and during the war he transferred his business to New York. It was there that he was introduced to the circles of traditional Greek shipowners, many of whom had also just moved to New York from Greece and London because of the war.

Greek shipowners kept a very tight international business and social circle; through their business they had formed international maritime networks based on Greek identity and Greek culture. Kinship, island, and ethnic ties – all of which implied trust in business apart from contributions to the actual organization and function of the shipping firm – provided the same advantages as membership of an elitist private club: access to information about the market, chartering, sales, and purchases of second-hand ships; shipbuilding, ship-repairing, and scrapping; financing from credit institutions; Premium and Insurance (P&I) clubs; and links with all other aspects of the shipping industry through access to London, the world's main maritime market. The intrusion of Onassis, a "foreigner", into the shipping world brought a much-publicized conflict with the leading figure of the Greek shipping community, Manolis Kulukundis, particularly on the controversial subject of the American-built ships, the Liberties, that were made available after the war to shipowners of allied governments on state guarantee. But Onassis took care to become a member of the community by the traditional Greek method: in 1946 he married the younger daughter of Stavros Livanos, a prominent Greek shipowner from Chios, and was thus "officially" admitted to the international Greek shipping family. An important aspect of this exclusive shipping clique that has played a major role in the growth of the fleet has been the constant competition and imitation of each other's practices even within individual families. In 1947 the other big shipowner and "foreigner" in Greek shipping circles, Stavros Niarchos, married the elder daughter of Stavros Livanos.

It was in these immediate post-war years that Onassis, together with Niarchos, was the first shipowner seriously to enter the tanker market. At this time the destroyed shipyards of Germany and Britain were looking for contracts that could contribute to their reconstruction. Onassis became one of the pedestals of this reconstruction and in 1949 he placed an order for the building of 16 tankers in the West German shipyards of Howaldswerke on very favourable terms. The opportunity to enter the tanker market was given by the Norwegians: because of foreign currency shortages, from 1948 to 1951 a ban was placed on the import of ships in Norway. Norwegian shipowners, who had been heavily involved in tanker shipping during the interwar period, were thus unable to benefit from the trade boom created by the Korean war in 1951, leaving the door open to Onassis, Niarchos, and other Greek shipowners to enter the tanker business.

Traditional families had always saved the profits of existing operations to buy a new ship; in so far as they depended on credit, it was usually limited to the guarantees that the mortgage on the ship provided and was paid off as quickly as possible. The ships they operated were largely tramp ships involved in the dry-cargo market. By contrast, Onassis and Niarchos entered the tanker market by using credit rather than cash for

the purchase of ships, and they guaranteed their loans with five- to ten-year charters from large American oil companies. This method of financing had first been used by the Norwegians in the interwar period. American banks could not refuse credit to previously unknown clients who made such compelling cases for loans.

By competing with each other, these two leading shipowners further developed ship-financing methods: rather than ordering one tanker at a time, they started ordering whole new series of tankers, backed by a single charter. Ordering a series of vessels at one shipyard reduced costs and also guaranteed employment in the yards for a number of years. The shipbuilders were able to exploit the economies that the increased scale of production provided and thus were able to offer reduced prices. Onassis was also the first to realize that costs could be reduced if the carrying capacity of a ship was increased. This realization encouraged him to become the first shipowner in the world to build a "supertanker": *Tina Onasis*, built in 1953, with a tonnage of 45,320 deadweight was considered a technological achievement. The tactic that Onassis used to enter the oil market was soon followed by many traditional Greek shipowners. Even more important for Greek-owned shipping, however, was the fact that Onassis and Niarchos succeeded in penetrating the US financial markets, by securing finance for their projects, and thus paving the way for other Greek shipowners.

In less than a decade Onassis became one of the biggest independent tanker owners. His entrepreneurial spirit, however, and international orientation brought him into direct contact with the oil-producing countries, and consequently into trouble with the oil-consuming countries and US multinational interests. By signing an agreement with Saudi Arabia, he provoked the wrath of the oil companies and created an international scandal. According to the agreement, Onassis was to transfer tankers of 500,000 GRT to the Saudi Arabian flag, and pay a certain amount per carried ton to the Saudi Arabian government. In return, the Saudi Arabian government agreed to give priority to Onassis's tankers in the loading and transportation of oil. It is not difficult to imagine what effect an independent Saudi Arabian tanker shipping company would have on the interests of oil companies and the countries they represented. The reactions were immediate: the US State Department protested to the Saudi Arabian government, and the British government brought the issue before the European Organization of Economic Co-operation (which claimed that the contract would cause discrimination against other maritime nations). Onassis was attacked on all fronts: US and European oil companies refused to charter his newly built tankers; his newly acquired whale-hunting fleet was attacked by Peruvian warships in the Pacific Ocean (partly motivated by Peruvian whaling interests); and the American government demanded taxes of 20 million dollars. Not surprisingly, the Onassis–Saudi Arabian agreement was never enforced; but luck turned this financial crisis to an extremely profitable outcome: the closure of the Suez Canal in 1956, which increased the world tanker demand and hence the freight rates, came at a time when Onassis was the only shipowner who had a large number of tankers free for charter. Thus, he not only avoided bankruptcy but also strengthened his financial status and further increased his fleet.

Despite the fact that Onassis's name was associated with tankers, his fleet also consisted of cargo ships and bulk carriers. This protected him from the risk of depending on a sole charter market. Besides, his interests were not restricted to bulk shipping: in 1950 he had already created one of the biggest whale-hunting fleets in the world. Moreover, among his investments that gave him weight and reputation was the acquisition in 1953 of the famous hotel and casino Hôtel de Paris in Monte Carlo. For a short period Onassis tried unsuccessfully to enter the shipbuilding industry, acquiring the Scottish shipbuilder Harland & Wolff. Banking was another sector in which Onassis was interested: he bought a small bank in Switzerland, the Banque de Dépôts, which was sold after his death.

During the 1950s he invested heavily in Greece. In 1957 he purchased the Greek national airline for the huge sum of 35 million dollars. The company was renamed Olympic Airways and within a short time it expanded its network of domestic and international destinations, contributing to the development not only of the tourist industry but of Greece as a whole. Onassis invested a great deal in the development of Olympic, although he never considered it his main business, unlike his son Alexander who was dedicated to it. In the late 1960s he proposed to the Greek government a 700-million-dollar project, which included the building of a refinery, investment in the aluminium industry in cooperation with the Aluminum Company of America, and the construction of an electricity-generating company. This project, which was partly in collaboration with Niarchos, was cancelled by Onassis in 1972, for reasons that were never made clear.

Factors that contributed much to the entrepreneurial success of Aristotle Onassis included his talent to recruit good advisers and loyal employees and his ability to communicate with them and take advantage of their ideas and proposals. Kostas Gratsos, who came from a traditional shipping family and was effectively his right-hand man, not only gave him the benefit of his valuable experience but also saw that his ships were manned by highly skilled seamen from Ithaca, one of Greece's traditional maritime islands. Onassis's talent for selecting and trusting able young men proved valuable even after his death, and many of his faithful executives and employees continue to stand up for his interests to the present day.

Onassis's private life was as colourful as his business career. In 1946 he married Tina Livanos, the younger daughter of Stavros Livanos, one of the biggest shipowners of the Greek-owned fleet in the 1950s. Tina, who was more than 20 years his junior, gave him two children, Christina and Alexandros; but their marriage lasted only until 1958. For the next decade Onassis's name was linked with the world-famous Greek soprano Maria Callas in what proved to be a long-lasting passionate affair that marked both their lives. But Aristotle Onassis again shook the international social circles by his marriage to Jackie Kennedy, widow of the assassinated American president, which took place in October 1968 on Skorpios, his private island in the Ionian Sea. Onassis's extraordinary raison d'être came to a halt five years later. The death of his son Alexander at the age of 25 in an aeroplane accident in 1973 was a tragedy from which he never recovered and he died in Paris two years later.

At his death, apart from his deposits in 217 banks around the world, his own bank in Switzerland, 25 per cent of Harland & Wolff, his island of Skorpios, his skyscraper in New York, and his fleet of 56 ships of 2.5 million tons deadweight, the rest of his wealth was estimated to be about one and a half billion US dollars. This consisted of investments in European, Latin American, and US companies in finance and banking, industry, real estate, shipping and transport, the construction industry, tourism, and other general enterprises. Onassis's entrepreneurial talent was still there, even after his death, and survives to the present day, as reflected in his will and in his choice of executors.

His daughter Christina inherited half of Onassis's assets while the other half went to the Alexander Onassis Foundation, set up in 1975 and named after her dead brother. Christina was in control of the business for a short period but she entrusted the running of her property to a group of Onassis's collaborators, who have continued since her death in 1988 to manage it for her daughter Athina. The Alexander Onassis Foundation remains one of the largest and most active foundations in Greece; under the management of a team of executives whom he chose, it continues to run successfully the fleet and other profit-making organizations as well as a wide range of charitable activities that he planned.

Aristotle Onassis, "Ari" as he was popularly known, personally created the myth of the Greek tycoon, and 25 years after his death his legend still makes headlines. Books, films, and documentaries on his life are still being produced. He epitomizes the Greek entreprencur par excellence. It is certainly no coincidence that Anthony Quinn, the actor who impersonated Kazantzakis's hero Zorba the Greek, was also the one chosen to play Onassis on screen.

Biography

Born in either 1900 or 1906 in Smyrna, Onassis fled to Athens after the Asia Minor disaster and emigrated to Argentina in 1923. There he imported tobacco from Greece until he had enough capital in 1933 to turn to shipping. He took advantage of the slump, and later of the need for transport in World War II, and invested in supertankers for oil in the 1950s. In 1957 he bought the Greek national airline. His wealth was legendary. He was married first to Tina Livanos and secondly (after a long affair with Maria Callas) to Jacqueline Kennedy. He died in Paris in 1975.

Onomastics

Onomastics is the study of names and naming practices. In this article, names are defined as personal names (place names are a different, though related and interesting, study), and Greek personal names are names borne by Greeks, whether in Greece itself or elsewhere in the world where Greeks have settled. In antiquity, as today, that imposes a very wide geographical scope, for already by the 8th century BC Greek cities were sending colonies abroad, in a diaspora which would leave Greeks settled on the Black Sea, in Asia Minor, north Africa, Sicily, south Italy, and beyond. Names always reflect the concerns and values of society, and are responsive to political, cultural, and religious influences. Changes over time are to be expected, but it is important also to register that there have always been regional variations, at any one time, within the Greek-speaking world.

Modern interest in the collection and study of ancient Greek personal names began in the early 19th century. Almost all the evidence available at that time came from literature, which, even when it includes historical works, can paint only a partial picture of a society. The picture, however, was about to be transformed by the discovery and publication of documentary evidence provided by inscriptions, papyri (for Graeco-Roman Egypt), coins, and artefacts. Documentary evidence is important because it gives the names of relatively ordinary people, and because it is found in all parts of the Greek world, and not just the main centres of literary output, above all Athens.

Inscriptions on stone, by far the greater part of documentary evidence, record citizen lists, decrees, treaties, and judgements but also the more personal tombstones, religious dedications and curses, and the manumissions of slaves. New documentary evidence continues to be discovered, published, and analysed, but it is already clear that the names of upwards of half a million individuals have survived, and tens of thousands of different names. From the 8th century BC the volume of documentary texts increased steadily, reaching its first peak in the Hellenistic age. It is during this period that the fundamental features of ancient Greek naming practices can be observed and documented. It is, however, worth noting that two earlier sources, Mycenaean texts and the Homeric poems, push back the history of Greek onomastics, albeit partially, by a further 500 years.

Dating mainly from the 13th century BC, and written in Linear B, a pre-alphabetic script comprising ideograms, numerals, and syllabic signs, Mycenaean records have been found at Mycenae, Thebes, Tiryns, and Pylos on the mainland, and Knossos and Cydonia in Crete. There are many uncertainties in interpreting the names in these documents, because the spelling is ambiguous and because, being inventories, they supply no context, but Mycenologists are agreed that the basic formations of Greek names as described below were already in place, including familiar names such as Theodora and Alexandra. The same is true of the Homeric epic poems, the *Iliad* and the *Odyssey*, which are generally agreed to be the culmination of an oral tradition which may reach back to the 13th century BC. It is, however, interesting to note that the names of the main actors in the drama – Priam, Hector, Agamemnon, Menelaus, Helen, Cassandra, Odysseus, Penelope – thought of today as among the most famous of

"Greek" names, did not continue in use in the Archaic and Classical periods. They enjoyed a revival under the Roman empire, especially outside Greece, in Italy and in parts of Asia Minor.

Greek naming conformed to the Indo-European pattern found throughout most of Europe until relatively recent times, by which a child received one given name. In public contexts, and for legal purposes, the given name was followed by the name of the father (patronymic), very rarely by that of the mother (metronymic). In certain circumstances, an indication of citizenship (ethnic) would also be given. These three elements – given name, patronymic, and ethnic – are the fundamental elements of nomenclature. The last two are also the building blocks of a much later development, family names or surnames.

In antiquity, as today, there was a tradition of naming the firstborn son after the paternal grandfather, and the second after the maternal grandfather (there is less ancient evidence for the naming of daughters). In leading families whose tenure of public office is recorded, it is sometimes possible to trace this pattern over two or three hundred years. Conservatism in namegiving ensured the preservation of names even after the concepts embodied in them had passed away, sometimes against the tide of new forces.

The patronymic generally took the form of the father's name in the genitive case (thus, Alexandros Philippou); but in areas of the Aeolic dialect (especially Lesbos and the facing coast of Asia Minor, and Thessaly and Boeotia on the mainland) the patronymic adjective was used (and applied to wives as well as children), formed by making an adjective out of the father's name. This usage was common in Homer (e.g. Ajax Telamonios, Ajax the son of Telamon); a second form found in Homer, in which the father's name is given a termination with patronymic force *-ides* (Hector Priamides, Hector son of Priam), survived in the historical period, for example Simonides and Bacchylides, but as an independent form deprived of patronymic force.

While the patronymic was important in identifying and sometimes legitimizing the individual, its use varied according to place and context. The 2nd-century AD writer Pausanias (2. 7) commented that the citizens of Sicyon in the Peloponnese recorded on their tombstones the name but not the patronymic of the deceased. From this statement it might be inferred that the use of the patronymic was standard everywhere else, but tombstones, which survive in their thousands, show that in most parts of western Greece and in Boeotia the patronymic was not generally recorded, while in nearby Thessaly it usually was.

Use of the ethnic also varied, according to context. The purpose of nomenclature is to identify, and at home an individual did not need to indicate origin. The city or regional ethnic was, therefore, used only when abroad. By contrast, in a city with an internal political organization of demes, such as Athens, Rhodes, or Eretria in Euboea, the demotic was given. At Athens, in the late 6th century, Cleisthenes' reforms required that the demotic should replace the patronymic (*Athenaion Politeia*, 11. 4), but by the 4th century it had become standard practice to give both. Thus, at Athens, "Alcibiades son of Cleinias, of the deme Scambonidai", abroad "Alcibiades son of Cleinias, of Athens".

The Greek grammarians knew two ways of classifying names. They were either "simple" or "compound" in formation, and, as to content, they were either based on the names of gods, "theophoric", or they were secular.

Simple names consisted of a noun or adjective, alone or with a suffix: for example, from the adjective *aristos* ("excellent", "best"), the names Aristos, Arist-ion, Arist-ullos, etc., feminine Arista, Aristo, Arist-ulla, etc. Compound names were formed by combining nouns, adjectives, verbs, or adverbs in various patterns. Thus, Aristo-teles, Arist-ippos, Aristo-kles, Aristo-boulos, Aristo-damos. The order could be reversed: Aristo-nikos or Nik-aristos. Compounds were often turned into a so-called "hypocoristic" form which could be shorter (for example, Kleommas from Kleomachos) or longer (Sophroniskos from Sophron). Women's names could take neuter as well as feminine terminations, and covered broadly the same range of form and content as men's, including military and political connotations, for example Alexandra, Stratippa, Demostrata. Abstract names such as Harmonia ("harmony"), Eukarpia ("fertility"), Glukera ("sweet") did exist, but seem to have originated as slave names.

Within these broad rules, the Greeks showed almost limitless inventiveness; some components, such as *polis* ("city") appear in more than 50 different forms. The following are just a few examples: parts of the body (*kephalos* "head", making Kephalos, Kephal-ion), animals (*leon*, "lion", making Leon, feminine Leaina, Leont-iskos, Aristo-leon; *hippos*, "horse", making Hippo-stratos, Strat-ippos, Hippo-krates, Krat-ippos, Fil-ippos), plants (*ampelos*, "vine", making Ampelos, Ampel-ion, Ampel-ides), political institutions (*demos*, "sovereign people", making Demo-sthenes, Demo-stratos, Arche-demos, Dem-archos), defence or protection (the verb *alexo* making Alex-andros, Alexi-demos, Alexi-polis). Though usually laudatory, attributes could also be (at least to us) pejorative, and yet were passed down from generation to generation: thus, *aischros*, "ugly", making Aischr-ion, Aischr-a, *gaster*, "stomach", making Gastron.

Theophoric names could take the adjectival or the compound form. The most common of all Greek names were the adjectival forms based on Apollo (Apollonios), Dionysos (Dionysios), and Demeter (Demetrios); but a greater range was provided by compounds in which the name of the god was followed by *-genes/geneia* (birth), *-dotos/dota* and *-doros/dora* (giving/gift), *-philos/phila* (loved/loving), *-kles/kleia* (renown), *-phanes/phaneia* (manifestation), etc. Thus, from Zeus, root Dio-, Dio-genes/Dio-geneia, Dio-dotos, Dio-doros, Dio-philos, Dio-kles/Dio-kleia, etc.

Theophoric names could be formed from cult titles of gods, and from lesser deities such as nymphs and river gods; the river Asopus in Boeotia, for example, gave rise to names such as Asop-ios and Asopodoros, which are found only in Boeotia and Athens. There was also the generic type from *theos* ("god"): Theo-genes, Theo-dotos, Theo-doros, Theo-kles, etc. The arrival of new divinities was duly marked in nomenclature; thus, from the late 4th century BC, worship of the Egyptian goddess Isis gave rise to Isi-doros, Isi-dotos, Isi-genes, etc., that of the god Sarapis (later spelling Serapis) to Sarap-ion, Sarap-ias, Sarap-is, etc.

The first major disturbance to the pattern of Greek nomenclature came with the arrival of the Romans who had a wholly

different system of nomenclature, with three names, *praenomen*, *nomen*, and *cognomen*. After the Romans conquered Greece, Greeks receiving Roman citizenship would adopt the *praenomen* and *nomen* of the donor (a conquering general, later the emperor or a governor); in this way, names like Julius and Flavius first made their way into Greek nomenclature. The third name, the *cognomen*, was usually Greek: thus, Tiberius Julius Alexander, Titus Flavius Alcibiades. The Romans indicated filiation in a brief formula which came between the *nomen* and the *cognomen*: for example, G(aius) Julius G(aii) f(ilius) Caesar. Greeks sometimes adopted this system, but often simply appended the patronymic to the *cognomen*. A new name-form developed, especially in Asia Minor, with the suffix *-ianus* (e.g. Herodianus from Herodes) which sometimes gave the name a patronymic force.

Christianity was destined to make a permanent impact on Greek nomenclature, but the change was neither sudden nor simple. Several different currents fed into the main stream. Some "Christian" names were in fact Jewish, for example John (Joannes), Anna, and Maria. In time, but not much before the 4th century, names incorporating new values appeared, such as Eusebius and Euphemia. Of the old names, the neutral theophoric names such as Theodora and Theophilos were retained, and some new compounds formed which had not occurred before, such as Theo-doulos (slave or servant of God), comparable to Christo-doulos (servant of Christ). More potent factors were at work, however. The appeal to parents by the 4th-century writer John Chrysostom to name their children after saints and not ancestors is a reminder of the inherent conservatism of naming, but also a background for the renewal of old pagan names with a new authority. Saints and martyrs were as likely as not to bear "pagan" names such as Demetrius, Dionysia, and Alexandra.

During and after the struggle between Christianity and paganism, Roman names, by now absorbed into Greek nomenclature, continued in general use. After AD 212, when citizenship was granted to all free inhabitants of the empire, Aurelius was the normal *nomen*; after the reign of Constantine (whose own name became a common "Christian" name after his conversion to Christianity), it was Flavius. In the correspondence of Libanius, in the 4th century, the names of recipients show a mixture of Roman names such as Marcus, Proclus, Modestus, Priscianus, and Ioulianus; old Greek names such as Andronikos, Alexandros, Dionysios, and Leontios; and a certain number of distinctly Christian names such as Eusebius, Eustathius, Euphemius, and Ambrosius. A century later, in the correspondence of the Christian Isidorus of Pelusium, Christian names such as Eulogius, Eulampius, Cyrillus, and Serenus account for a greater proportion, but there are also surprising survivals such as Isidorus, Serapion, and Apollonius. Overall, by this period, a general simplification in nomenclature had taken place, the patronymic had largely disappeared, and the ethnic fallen into disuse.

Invasions and political quarrels marked the end of the Roman empire, within which the Greek-speaking world was contained. The "Greek" world survived in the east, in the Byzantine empire. There began a period of transition in nomenclature. Biblical names and those with pious meaning, which marked the ascendancy of Christian values, remained in use, but names of new rulers, such as Basileios, Leon, Alexios, also enjoyed a vogue. Family names began to be adopted, but only by ruling families. By the 13th century, however, the personal names Ioannes, Georgios, Demetrios, and Maria had established a lasting ascendancy. By that time, too, it was usual for monks to adopt a new name on entering the monastic life, and a class of names developed which was reserved for them, e.g. Gerasimos, Isaias, Iakovos, Makarios, though some continued to bear pagan names such as Dionysios, and even Hermes and Alcibiades.

The two main influences in post-Ottoman Greek nomenclature are Christianity and antiquity. Examples of the former are Ioannes/Yannis, Demetrios/Dimitri, Nicholas/Niko, Spiridon/Spiros, Konstantinos/Kostas for men, Eleni, Anna, Maria, Demetra, Konstantina for women, and of the latter, Aristoteles, Sokrates, Xenophon, Demosthenes, Leonidas, Miltiades, which were never forgotten but widely given from the 18th century onwards. Both male and female names are often familiarized by the addition of a hypocoristic termination such as *-aki*, *-oula*, or *-ita*, for example Petraki from Petros, Elenitsa from Eleni. The importance of the personal name is shown by the custom of celebrating name-days (the festival of the saint in question) rather than birthdays.

Hereditary family names or surnames developed sporadically from about AD 1000, at first mainly among ruling families, whose family names were often derived from locations, towns, and monasteries. The widespread use of surnames dates only from the War of Independence (*c.*1832). Many surnames take a patronymic form, with the terminations *-opoulos* or *-ides* (e.g. Konstantinopoulos, Apostolides), or are derived from trades (Metaxas, "silk weaver", Petalas, "blacksmith"), or physical characteristic (Kephalas, "head"). It is primarily in surnames that distinct local variations are to be found, reflecting past history, often occupation by foreign powers. Italian, especially Venetian, occupation left its mark in both personal and family names in Crete, the Ionian islands, and the Cyclades. Many surnames in Cephalonia, for example, have the termination *-atos* (Marinatos, Laskaratos), the Italian *-ato*. Surnames in *-oglou*, reflecting the Turkish "son of" and equivalent to Greek *-opoulos*, are particularly common among Greeks from the Pontic area of Asia Minor.

Opera and Operetta

Modern musical drama, like other forms of European classical music, was transmitted to Greece primarily through the Ionian islands, which were ruled successively by Venice, France, and Britain during the Ottoman domination of the mainland. Yet ancient and even medieval Greek precedents for sung drama are not lacking. Classical tragedies were originally performed with melodies by their authors that were sung for centuries. After the decline of ancient theatre, some of its musicodramatic elements persisted in the imperial ceremonial, popular entertainments, and Orthodox worship of Byzantium. Nevertheless, despite the efforts of some commentators to find evidence for the existence of Byzantine musical theatre in such texts as the hymns of Romanos, only a single sacred drama from around the late 14th century has come to light, the strongly liturgical character of which has been affirmed by Symeon of Thessalonica and modern scholars. Contemporary Greek musical drama may therefore be linked to antiquity only indirectly through the medium of Italian opera, the late Renaissance creators of which were deeply influenced by the humanist rediscovery of Classical tragedy.

The earliest documented stagings of Italian opera in the Ionian islands were mounted in 1733 at the San Giacomo theatre in Corfu. Operatic performances by visiting Italian troupes became increasingly frequent over the next century, during which theatres were also constructed on the islands of Zakynthos (1813) and Cephalonia (1838). While it appears that local musicians did not participate to any significant extent in the production of opera before 1840, from the early decades of the 19th century Ionian-born composers were setting Italian libretti to music. The doyen of this first generation of native composers was Nikolaos Halkiopoulos-Mantzaros (1795–1872), whose early one-act comedy *Don Crepusculo* of 1815 is the oldest extant Greek opera. Invited to Naples for study in the 1820s by Zingarelli, Mantzaros later returned to Corfu where, in addition to composing further operas and the music for the Greek National Anthem, he exercised considerable influence as a teacher. By the middle decades of the 19th century operas by such Greek composers as E. Lampelet, P. Carrer, and S. Xyndas were being performed alongside works by Donizetti and Verdi not only in the Ionian islands, but in Italy itself. Around this time Ionian composers and a few Italian expatriates introduced modern Greek themes to opera in a series of historical works based on the mainland's revolt against the Turks. These paved the way for the première in Corfu of Xyndas's *The Parliamentary Candidate* (1867), the first opera composed to a Greek libretto. Development along these lines continued until the outbreak of World War II, after which the musical culture of the Ionian islands went into a serious decline that was compounded by the destruction of several theatres in the earthquake of 1954.

The introduction of opera to mainland Greece occurred on 4 July 1837 when a group of Italian tightrope walkers employed an orchestra of ten to stage the first act of Rossini's *The Barber of Seville*. Despite the complete omission of Rosina's role due to the lack of a female singer, this performance was so enthusiastically received that an Italian opera company arrived the very next month to mount the entire work. After 1840 royal patronage and growing audiences stimulated increasingly frequent visits to Athens, Patras, Piraeus, and Syros by Italian and later French troupes, all of whom were evidently unaffected by the protests of Greek cultural conservatives incensed by what they perceived to be the immorality of many libretti. The mainland's growing operatic scene also soon attracted the attention of Ionian composers including Carrer, whose patriotic opera *Markos Botsaris* – which includes in its first act a lament sung by an old klepht ("O Yero Demos": Old Demos) that proved to be so popular that it virtually became a folk song – was previewed in Athens before the royal family in 1858 and premièred in Patras in 1861. S. Samaras, N. Lampelet, D. Lavrangas, and other members of the Ionian school would subsequently dominate Greek opera until the first decade of the 20th century. Ionians were also instrumental in the creation of the first Greek opera troupes at the end of the 1880s, one of which survived long enough to tour Egypt and Turkey. A more durable Athenian company, the *Helleniko Melodrama* founded by Lavrangas, inaugurated its existence with performances in 1900 of Puccini's *La Bohème*. These touched off an unprecedented wave of enthusiasm for opera that was sufficient to allow the troupe to serve as Greece's main operatic ensemble until the creation of the present National Opera (*Lyriki Skini*) in 1939.

Opera in the Italian tradition was gradually eclipsed on the mainland during the second decade of the 20th century by the rise of Greek operetta. Although French companies had been staging performances of operetta in Greece since the 1870s, the appearance of native operetta may be attributed more immediately to the Athenian revues of the early 1900s. The success of these pastiches of pirated foreign melodies encouraged the impresario I. Papaïonannou to found the *Hellinike Operetta* in 1909 to produce entire Viennese operettas in Greek translation. Other companies were soon founded, and in 1914 the veteran opera composers Samaras and Theophrastos I.

Sakellarides (1883–1950) wrote the first Greek operettas. The latter, who was the German-trained son of the famous cantor John Sakellarides and Papaïoannou's principal conductor, composed more than 103 musical works for the stage including the enduringly popular *O Vaphtistikos* (The Godson, 1918). His main compositional rival was the bass Nikos Hatziapostolou (1879–1941), who wrote music combining elements of French operetta with contemporary Athenian popular song. From the première of Hatziapostolou's *I Moderna Kamariera* (The Modern Chambermaid) in 1916 until the late 1920s, operetta reigned as the chief musical entertainment of Greece's westernized bourgeoisie. Other composers of operetta during this period included the classically trained Lavrangas, Lampelet, and Yiannis Konstantinides, who wrote popular music under the pseudonym Kostas Yiannides.

As the urban Greek public shifted its allegiance to operetta, Manolis Kalomiris emerged at the head of a so-called National School of composition to challenge the supremacy of Italianate classical music. While continuing the later Ionians' use of folk material in such operas as *To Dachtylidi tis Manas* (Mother's Ring, 1917), Kalomiris employed it in a manner derived from contemporary central European music. Greek opera thereafter began to fall along a spectrum running from the works of the National School to pieces firmly within the western mainstream such as *Soeur Béatrice*, composed in 1918 by Dimitri Mitropoulos (1896–1960) on a text by Maeterlinck. Despite the general decline of opera and operetta in Greece after World War II, T. Antoniou, A. Logothetis, Mikis Theodorakis, and many other Greek composers have continued to write significant musical dramas for production both at home and abroad.

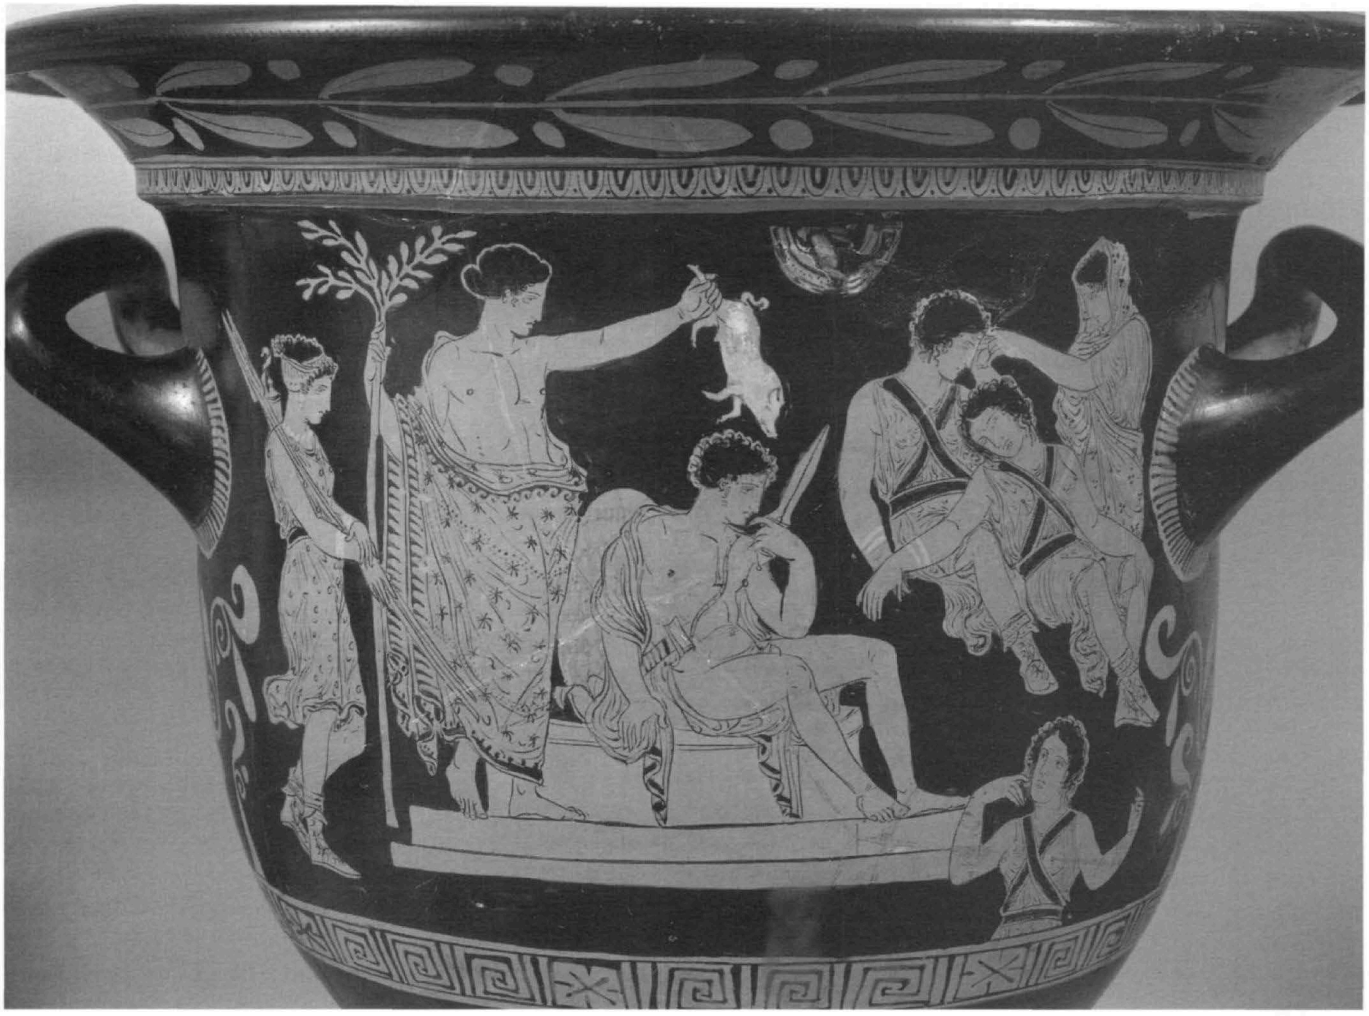
Oracles

Oracles were both utterances of (usually) gods, with or without an intermediary and in response to human questions, and the places where such utterances were made. At reputedly the oldest Greek oracular site, that of Zeus at Dodona in Epirus, the god was believed to make his response known through the rustling of the leaves of a sacred (probably Valonia) oak or the cooing of a dove (probably a ring-dove) perched there, which signs were interpreted by priests. By the 5th century BC, however, priestesses (later at least called "Doves") under the inspiration of Zeus simply gave affirmative or negative responses to questions scratched by enquirers on lead tablets, of which about 80 still survive (the most legible is in the museum at nearby Ioannina).

Far more is known about the oracle of Apollo at Delphi, which probably originated in the late 9th century BC (references to an earlier oracle of another deity on the site are subject to much modern debate). After a possible stage when its oracles, similarly to those at Dodona, merely involved interpretations of the rustling of the leaves of a laurel tree, already at the beginning of the Archaic age a local woman known as the Pythia was believed to act in a trance as Apollo's mouthpiece.

The procedure was as follows. Originally just once a year (according to Plutarch, *Moralia*, 292e), on Apollo's birthday, but from perhaps the 6th century BC on the seventh day of every month (except for the three months of winter when Apollo was believed to be among the Hyperboreans), consultation could take place, provided that the ominous behaviour of a goat sprinkled with cold water was favourable. Authorities (the Delphic Amphictiony) gave precedence first to Delphians and then favoured states and individuals. This was presumably often won by such costly gifts (most notably by the Lydian king Croesus) that some states even built treasuries at Delphi to house them (the best-preserved today is that of the Athenians). All enquirers had first to place on an altar an inordinately expensive cake (*pelanos*) as fee. Accompanied by the resident representative of his city (*proxenos*), the enquirer passed over the threshold of the temple, made blood-sacrifices, and entered the inner sanctuary, where he kept silence as a priest (*prophetes*) put the previously supplied question to the unseen Pythia, who was seated upon a tripod, and converted her response into intelligible, though often ambiguous, hexameters. The geology of the site and toxicology respectively prove untenable the ancient reports that the Pythia's trance was induced by mephitic vapours emanating from a chasm or by the properties of laurel leaves: it was probably merely self-induced by an uneducated and pious old woman of great religious susceptibility. The *prophetes*, we may assume, formulated responses on the bases of common sense, the desires of the enquirers, and Delphic interests (although the "Medizing of Apollo" during the Persian Wars has been much exaggerated, the oracle did later fall under the influence of both Philip of Macedon and the Aetolian League). A much cheaper and more common form of oracle at Delphi, and one that came to be practised on other days of the month, was cleromancy, by which one of two presumably differently coloured beans was drawn to give an answer of "yes" or "no".



Oracles: Attic red-figure krater showing Orestes as a suppliant at the shrine of Apollo in Delphi, 4th century BC, Louvre, Paris

Despite rivals, most notably the oracles of Zeus at Dodona and, from the 5th century BC, Ammon at Siwa in the Egyptian desert, the most famous oracle in the Archaic and Classical ages was that at Delphi. Although the vast majority of consultants were individuals, it played also a prominent political role (Sparta even maintained a standing commission of ambassadors called Pythii to transact Delphic business). Some evidence suggests that in early times it was consulted over the removal of unpopular rulers, but later it was never involved in internal politics. Although its public importance became most apparent in the belief of virtually all states that Apollo's approval was essential in the planting of colonies, it also both pronounced on the advisability of waging war and was involved in arbitration between states. In the 4th century BC, however, most public consultations were on cultic matters, and even these became rare after *c.*300 BC. In the Hellenistic period its functions were largely lost in the revival of local oracles, especially those of Asia Minor. Quintus Fabius Pictor enquired of Delphi in 216 BC about the proper rituals for ensuring victory over the Carthaginians, but after the Punic Wars the Romans usually had sufficient confidence in their own abilities to dispense with Greek oracular aid including Delphi's.

Other oracles offered a considerable variety in consultative practices, including the use of male spokesmen for the god, such as the *thespiodos* of Apollo's shrine at Claros in Asia Minor who drank from a sacred spring. At some sanctuaries priests interpreted "divine" signs such as those apparent in the flames (empyromancy) on Zeus' altar at Olympia. There were also oracles that dispensed with intermediaries, often giving their answers by lot (as with the beans at Delphi) and even dice but most notably by means of incubation, which was practised most commonly by those suffering from disease, insanity, or injury. In this, during a ritual sleep at a sanctuary, consultants were believed either to be healed by a god (often Asclepius) with or without divine helpers or sent a dream that prescribed treatment (Aristophanes describes in detail one such night at the Asclepieum in the Piraeus at *Plutus*, 653–747). Physicians were frequently in attendance subsequently to effect the cure. A bizarre, unmediated but non-medical parallel is afforded by the oracle of Trophonius at Lebadea in western Boeotia. Here the enquirer, after lengthy and elaborate preliminaries, had to thrust himself into a claustrophobic subterranean pit, where the chthonic deity made revelations to him and whence he emerged terrified and barely conscious to be questioned by priests and restored to sanity by relations (graphically described by Pausanias, 9. 39. 5–14).

Although Plutarch (d. after AD 120), himself a priest at Delphi for the last 30 years of his life, wrote on the decline of

oracles (*De Defectu Oraculorum*, *Moralia* 409e–438e), inscriptions from the 2nd and 3rd centuries AD on the building of the oracle of Apollo at Claros prove its continued popularity for public consultations by neighbouring states. During this period too various charlatans sought to exploit human gullibility by oracle-mongering. The most notorious of these was Alexander of Abonuteichos in Paphlagonia, whose tricks, involving a live snake apparently attached to a lifelike artificial head (whose jaws he could manipulate) and a hot needle to remove the wax seals of consultants' written questions, are hilariously excoriated by Lucian (*Alexander* or *False Prophet*).

Some well-established pagan oracles certainly survived into the early Byzantine period (the emperor Julian consulted several, including Delphi and Dodona, before embarking on his war against the Sassanian Persians). However, their anti-Christian utterances, many of which had been collected by the Neoplatonist Porphyry in his lost *On the Philosophy of the Oracles*, hastened their suppression. Christians associated them with demons and witches, built churches on their sites, and even forged oracles, such as one of Apollo confessing that his temple at Cyzicus was now the home of the Theotokos. Although Constantine I closed the Asclepieum at Aegae in Cilicia, pagan incubation survived into the 5th century AD, and the practice itself continued throughout the Byzantine period (and has not completely died out today), Christian saints simply supplanting the older gods.

During their heyday the authority of oracles was such that no certain case of disobedience is known. Even among philosophers only the Epicureans denied their claims. Nevertheless, since typically an oracle did not initiate action but either merely expressed approval or disapproval or chose between alternatives put to it by consultants, it could be manipulated into giving apparent blessing to a dubious enterprise. Even the pious Xenophon was chided by Socrates for asking Apollo to which gods he should sacrifice before setting out as a mercenary on the expedition of Cyrus instead of enquiring if he should join it at all (*Anabasis*, 3. 1. 5–7). Bribery was also practised, but not as often as ancient authorities claim.

Collections of oracles had less authority except in the case of the most famous, the Sibylline oracles. Originally a single prophetess, the word sibyl (probably not Hellenic and therefore suggesting the existence of pre-Greek prophetesses) had become at least by the 4th century BC a generic term for such women throughout the Greek world and later beyond. They were believed to prophesy in the normal manner either under the influence of a god (Apollo for Virgil's sibyl in *Aeneid* 6) or through their own inspiration. Collections are first heard of in connection with the books offered to Tarquinius Priscus (traditionally king of Rome 616–579 BC), the last three of which he bought and had preserved in his new temple of Capitoline Jupiter. Upon its destruction in 83 BC a collection was made from scattered copies, and this was still being consulted as late as AD 363. The surviving Sibylline oracles, in Greek hexameters, date from the 2nd century BC to the 7th century AD and are of mainly Jewish origin with some pagan and some Christian material, which last claims the Sybil as an independent witness to the Christian faith, supports Christian morality, attacks paganism, and prophesies the suppression of certain pagan cults.

The Chaldaean oracles, again written in hexameters and surviving only in fragments, were traditionally ascribed to a father and son named Julian in the 2nd century AD. These offered a philosophical guide to how in a dualistic world believers might empty themselves of evil matter to ascend to a triune deity consisting of a monadic Paternal Intellect, a dyadic Second Intellect, and the Cosmic Soul, which was identified as Hecate. They were much used by the Neoplatonists (especially Porphyry and Iamblichus), fascinated Psellos in the 11th century and were known to Plethon in the 15th.

Among Byzantine collections of oracles is one written in iambics, purportedly by the emperor Leo VI (886–912), which predicted civil war in Constantinople and the rise of a saviour monarch. It had considerable popularity into the Tourkokratia, when messianic prophecies continued to appear. An interesting example of these appears in the massive *Book of Oracles* (containing both fulfilled examples and others awaiting fulfilment), which Païsios Ligarides dedicated in 1656 to tsar Alexis Michajlović who he wrongly predicted would be the liberator of the Greeks from Ottoman rule.

Oral Tradition

Oral tradition, since it is by definition not fixed by writing or recording, is continually in a state of change: rather like

language itself, it is transmitted from person to person and created afresh in the course of every such transmission. There are two indirect routes to knowledge of oral tradition before our own day. The first is by way of authors who explicitly record tales or literature that reached them by word of mouth, or who depict the performance of oral texts. The second is by way of literature that we may judge for stylistic or comparative reasons to have oral origins.

Thus, although the oral literature and history of early Greece are unknowable to us by any direct means – we can have no real evidence that precedes the first written texts, those of Hesiod, Homer, and Archilochus – all three of these still have much to tell us, indirectly, of the oral literary milieux from which they evidently derive.

Hesiod tells us (*Works and Days*) of his victory in a poetry competition in the course of funeral games; it has been supposed that the *Theogony*, his other surviving genuine work, was the winning poem. Evidently other winning poems, in other similar competitions, were not necessarily written down. It has also been hypothesized that the Homeric poems were composed for competitive performance of a similar kind. Hesiod describes the origin of his poetic inspiration as a gift by the Muses; this is typical of the solutions offered by oral poets for the difficult question why some people are able to compose long narrative poems while others are not. His livelihood as a farmer – if we accept the autobiographical framework of *Works and Days* as true to life – is by no means unusual for epic poets in other cultures.

The two great Homeric epics say nothing at all about their own origin, except for brief invocations of a "goddess" or Muse. It was traditionally held, in later Greece, that they were composed for oral performance. Many have thought that the repeated scenes in the *Odyssey* in which singers perform at feasts are depictions of how the two epics themselves were performed. The use of stylized and repetitious formulas throughout these epics was imitated, with varying accuracy, by later authors of Greek and Latin literary epics, but it was viewed as little more than a curious quirk of the Homeric style until, in the 1930s, Milman Parry showed that these formulas were the building blocks with which long oral narrative poetry is typically, and necessarily, composed.

Parry's demonstration drew on his fieldwork among the oral epic poets of modern Bosnia. Equally important for those who wish to use the Homeric poems as historical sources was the evidence gathered by Parry and his co-worker, Albert Lord, demonstrating the rapid transformation of epic poems in the course of successive performances. It has been gradually accepted that poems recorded in the 8th century BC (or the 7th, as many now believe) could scarcely retain any accurate and identifiable historical detail concerning events of around 1200 BC, the traditional dating of the fall of Troy. The language and the social background would also predominantly reflect the period at which the epics were recorded.

In 5th- and 4th-century BC Greece the *Iliad* and *Odyssey* had become classics, learned by heart by many schoolboys. There were professional reciters whose business was to perform Homer; the main character of Plato's *Ion* is in this trade. Traditions of that kind can continue for a long time: the Sanskrit poems of the *Rig Veda* were transmitted similarly for many hundreds of years. In its fundamental aims, of accurate recitation and literal transmission, such a tradition differs entirely from those in which oral epics were originally composed.

The earliest non-epic Greek poetry now surviving is that of Archilochus. His iambic poems, and those of Hipponax, belong to a tradition of ritualized insult and obscenity that is not visible in the Homeric poems but for which there is some independent evidence from Classical Greece.

The Homeric poems do depict oral performances in various lyric genres that were soon to turn into written literature. The mythological and praise poetry of athletic games and banquets, as described in the *Odyssey*, may seem closer in style and occasion to that of Simonides and Pindar than to that of Homer himself. Wedding songs, depicted in the *Iliad*, are recorded in writing from Sappho onwards. Funeral laments are also described in the *Iliad* and *Odyssey*, and these have been a major genre of Greek oral poetry at many later periods. Working songs, too, have remained a feature of oral tradition: some later ones, such as the Rhodian "Swallow song", are directly recorded in Classical texts.

Thus, between 700 and 550 BC many poetic genres were turned over to literary composition and written transmission. In the 5th century BC prose was to follow. The sources of Herodotus' information, and of Thucydides', were almost wholly oral, the reliability of their narratives naturally varying – as oral tradition generally does – with the length of the period over which the information had been transmitted. History, from this point onwards, was written; records of local and genealogical history, in particular, help to show us how much had until then depended on oral transmission and collective memory. What of the stories of the gods? Greek mythological storytelling, although serving as a source for Hesiod, Homer, Pindar, and many other poets, may always have existed as a prose genre and as such remained essentially oral. Its wealth, even in Roman times, can be judged from the rich records of local mythology gathered by the scholar Pausanias of the 2nd century AD . A storyteller depicted in Longus' *Daphnis and Chloe*, a novel of about the same date, told an apposite mythological tale to the two lovers, and was rewarded for it (generously!) with a kid.

In Classical and Roman times epic narrative probably disappeared completely as a genre of Greek oral poetry. Later, it was to reappear. The 15-syllable "political" metre, whose earliest use may possibly have been in laments, emerges as the vehicle of Byzantine Greek popular verse, of which the best-known example is the *Digenis Akritis* epic. Like certain other medieval European epics, this was several times recorded in writing, in versions so radically different from one another that oral tradition (rather than a manuscript stemma) must be what separates them. The historical background to *Digenis Akritis* is the prolonged warfare between Byzantines and successive Muslim powers on the Anatolian plateau from the 10th to 12th century AD. Armenian, Turkish, and Arabian oral epics deal with the same historical nexus. Common features are the highlighting of local nobility rather than distant royalty, and the importance of intermarriage between opposing families – as in the parentage of Digenis, "the twice-born", himself.

There is much additional evidence for oral poetry and its context to be found in Byzantine literature. Examples include such major works as the *Chronicle of the Morea* – not neces-

sarily oral in origin but linguistically, stylistically, and metrically close to oral texts and quite at odds with the classicism of high Byzantine culture.

The political verse is still ubiquitous in modern Greek oral poetry, *tragoudi*. Several genres can be distinguished nowadays, none of which attains epic length. They include the short-lived and still-imitated *rebetika* that were once symbolic of the criminal subculture of Athens. Typical, though, are poems of 12 to 40 lines, usually described by folklorists as "ballads", often evoking a figure or an incident of established tradition and thus already familiar to the audience. Some legends that recur in these ballads are shared by several neighbouring cultures. "The Bridge of Arta" tells of a wonderful structure that could not be successfully completed until the architect's young wife was immured in it: this story is known in all the Balkan countries – in Romania, for example, it is familiar as "Master Manole". Specifically Greek are the *klephtika*, tales of the brigands or freedom fighters of Turkish-ruled Greece; and Digenis Akritis remains one of the heroes of the songs that can still be heard in oral performance in parts of modern Greece.

Orchomenus

City in Boeotia

Orchomenus, cited by Homer as a paradigm of a wealthy city (*Iliad*, 9. 381), is often qualified as Minyan. The eponym Minyas is a shadowy, almost non-existent figure, but the place was real enough, and its reputation justified, at least in the Mycenaean period.

Situated in the northwest corner of the Copais, Orchomenus dominated the whole of this quadrant of Boeotia. Settlement was more or less constant from the Neolithic period. The most striking surviving monument is the Mycenaean tholos tomb (14 m in diameter) called the Treasury of Minyas. Also from the Mycenaean period isolated finds of pottery and fresco fragments have been found on the lower slope of the hill into which the tholos tomb was set. From the area of the convent east of the tomb have come numerous wall painting fragments. The economy of Mycenaean Orchomenus seems to have depended on crops grown in the Copaic basin. The Mycenaeans – like their British successors of the 19th century AD – constructed a system of hydraulic works to control the waters flowing into the basin in order to render the larger part of it free for cultivation. The canals were directed to a number of swallow holes – *katavothrai* – on the eastern shore and in the northeast corner of the Copais, which was protected there by the island fortress of Gla, which was both a control point – since the northeast bay of the Copais is the only part of the basin not visible from Orchomenus – and a refuge. Gla was abandoned at the end of Late Helladic IIIB. This suggests that the drainage works of Minyan Orchomenus were no longer functioning, the bureaucracy which maintained them having broken down. Nothing is known about relations between Mycenaean Thebes and Mycenaean Orchomenus: the legends concerning the war between Orchomenus and Thebes are more likely to reflect events during the 6th century BC than those of the Bronze Age.

In Archaic Boeotia there were still two major spheres of influence, one around the western half of the Copais under Orchomenus, the other covering the rest of the territory and more loosely tied, with no obvious dominant state. The power and influence of Orchomenus in the Archaic period may be reflected in the tradition that Orchomenus was a member of the Calaureian Amphictiony. This association was based at a sanctuary of Poseidon on the island of Calaureia (Poros) in the Saronic Gulf, for which evidence goes back to the 7th century BC. Eventually, Orchomenus, as it tried to extend its control to the east, and Thebes, moving westward, ran into each other, the result being the confirmation of Theban supremacy over the rest of Boeotia. This was assured by the fourth quarter of the 6th century, and is reflected not only in the literary traditions, but in contemporary inscriptions.

However, the new Boeotian League which emerged towards the end of the 6th century under the leadership of Thebes was by no means an autocratic association. One sign of this is the appearance late in the century of a distinctive Boeotian coinage, which means that there was not only an accepted common standard, but also a common economic policy. That the policy was consensual is shown by the facts that not only Thebes but at least nine other member states had their own mints, and that Orchomenus, although reduced, was allowed to issue its own small denomination coinage with a distinctive symbol of grain(s) of corn on the obverse, rather than the otherwise general Boeotian shield.

During the Persian invasion of 480/79 BC, Orchomenus joined Thebes and most of the rest of Boeotia in Medizing. In the period after the Battles of Tanagra and Oenophyta (456

Orchomenus: Church of the Dormition, built in 874 according to a Bulgarian style similar to that of Hagia Sophia at Ohrid

BC), when Athens dominated Boeotian affairs, Orchomenus may have been a member of the Delian League, but by 446 it had become a place of refuge for disaffected Boeotians of the oligarchic persuasion, who eventually defeated an Athenian force at nearby Coronea and threw the Athenians out of Boeotia.

Orchomenians fought on the left wing in the victorious battle of Delion (424), but it appears that, as the 5th century drew to its close, Orchomenus was being gradually stripped of its power and influence, with Thebes growing progressively more dominant within the Boeotian League. By the end of the century Orchomenus had lost control of Chaeronea and Lebadea, and was contributing only two of the 11 federal Boiotarchs.

It is not surprising that Orchomenus became a centre for anti-Theban sentiment. During the Corinthian war (which began in 395) it seceded to Sparta, and was protected by a Spartan garrison until at least 375. After the King's Peace (387/86 BC) Orchomenus, like the other poleis of Boeotia, formally regained its independence.

After the expulsion of the Spartan garrison from Thebes in 379/78, the Thebans gradually re-established themselves as the dominant power of Boeotia, and confirmed their status at the battle of Leuctra (371 BC). The Theban-led Boeotian League established the Basileia, games in honour of Zeus Basileus at Lebadea, which had formerly been dependent on Orchomenus. This Zeus was the original patron deity of Orchomenus, and the location of his sanctuary on the hill of Profitis Elias was an open provocation to the Orchomenians, and a public proclamation to all who passed by – since the hill is clearly visible from the road to Delphi – of the political pretensions of the Boiotoi, that is, the Thebans. The Thebans went even further, and in 364 razed Orchomenus.

This destruction was not permanent, as Theban power waned after the death of Epaminondas, and hostility between Thebes and Phocis drew closer to open warfare. Orchomenus was functioning again as early as 359 BC, and during the Third Sacred War it was mostly in the hands of the Phocians. But at the end of this war (346 BC) Philip II of Macedon handed Orchomenus back to Thebes, when it seems to have been destroyed and the population dispersed.

However, after Chaeronea (338), Philip restored the city, and Alexander the Great even commissioned an engineer (Crates) to drain the Copais, but this enterprise was not completed, and Orchomenus never really recovered its former stature. During the Hellenistic period it fell upon bad times, was compelled to borrow money – which it had difficulty repaying – and relied increasingly on the generosity of individual citizens for its public operations. It is clear that under the Romans Orchomenus had shrunk to the status of a village, which indeed it has remained until relatively recently.

After antiquity, settlement persisted at the foot of the hill Akontion, focusing on the villages of Skripou and Petromagoula (now joined into one and called Orchomenus).

The outstanding monument surviving from this period is the church of the former convent of the Koimisis tis Theotokou (AD 874), one of the earliest cruciform churches in Greece. Its builders used blocks from an ancient temple and the nearby theatre (4th–3rd centuries BC).

Aside from the tholos tomb, theatre, and church, the most impressive remains are traces of city walls on the Akontion hill and, on the acropolis proper, fortifications built by the Macedonians late in the 4th century BC. No certain trace has been found of a Mycenaean palace, or of the sanctuary of the Charites – the Graces – whose cult Pindar mentions in *Olympian* 14, nor of the supposed tomb of Hesiod.

ALBERT SCHACHTER

Summary

A city in western Boeotia 11 km northeast of Lebadea, Orchomenus was important in the Bronze Age and famed in myth, but in historical periods was subordinated to and by Thebes. Its outstanding monuments are from the Bronze Age (the "Treasury of Minyas", a tholos tomb; the fortress of Gla in the northeast corner of Lake Copais), the early Hellenistic period (a theatre), and the 9th century AD (church of the Dormition).

Orgiastic Cults

The term *orgia* designated certain ceremonies and religious rites, with particular reference to initiation into a specific cult. Usually there were secret rites that had a symbolic function. The term "mystery" is also used. As Walter Burkert remarks, ancient mysteries were a kind of personal religion, since the initiation depended upon a person's decision to participate in a cult, and its practice enforced hope and belief in prosperity and future life. Such cults usually consisted of a variety of activities, such as purifications, processions, sacrifices, and dramatic enactments. The word mystery (*mysterion* in Greek) comes from the verb *myein*, meaning "to close". The *mystai*, those who participated, were required to keep their mouth closed and not to reveal secrets to those who had not been initiated. The word "orgiastic" in its modern sense probably best describes certain cults, particularly towards the end of the Hellenistic time, when a fusion of religions from various origins took place. The most important cults of this kind were Eleusinia, Thesmophoria, Dionysia, Orphica, Cabeiria, and mysteries for the worship of Cybele, Isis, and Sabazius.

The general idea of passing beyond the limits of morality in as many directions as possible lies behind the existence and performance of many orgiastic cults. Moreover, the psychological need to ritualize all possible polarities of human nature, so as not to be excluded from a community but rather belong to one, is another factor that explains the wide reception they had in antiquity. Herodotus (8. 65) speaks of 30,000 people attending mysteries. The roots of many orgiastic cults are hidden in the mists of prehistory, since they developed from rural festivals that celebrated the power of nature and fertility. The notions of death and resurrection are associated with many principal figures of the mysteries, for example, Dionysus, Persephone, Adonis, Attis, Osiris, and the Mithraic bull.

The Eleusinia were a mystic cult centred around the myth of the rape of Persephone, daughter of Demeter, by Hades, and the search of the mother for her daughter. The explanation of the natural phenomena and the human hope for rich agricultural production and fertility were treated in a symbolic manner. A series of purification rites took place. Many citizens of Athens were initiated in these mysteries, and although there is some uncertainty as to what went on, there are plenty of literary and archaeological sources to help us reconstruct the image of the Eleusinian mysteries. They continued to exist throughout the Roman period, until the 4th century AD, when the emperor Theodosius abolished them.

The Dionysiac cults, which had more of an orgiastic character in the modern sense of the word, included much wildness and extravagance. The cult of Dionysus had many festivals, for example, the City and the Rural Dionysia, the Anthesteria, and the Oschophoria. Besides the official celebration in honour of the god, there were also private celebrations that involved ecstatic worshipping of the god and going beyond one's self. The phenomenon of maenadism, as described in Euripides' *Bacchae*, is one example of extravagant rites that, even if they are mythical, still retain the element of self-transcendence that orgiastic cults promoted. Women in a state of ecstasy abandoned their homes and joined frenzied dances on the mountains swinging thyrsi and torches. This cult involved as a sacramental meal the devouring of an animal as it was bleeding. There is evidence of *orgia* of this type on Mount Parnassus by women controlled by Apollo who admitted Dionysus to Delphi and assisted the establishment of his cult in a milder form.

The Orphic cult promised life after death, and was related to oriental and Egyptian ideas of the afterlife. It involved many expiation rites. The worship of Cybele, or the Great Mother, is the result of much religious syncretism. The orgiastic character is strongly associated with her due to the institution of eunuch priests, the self-castrating Galloi. As with the Eleusinian mysteries, there is a mythic narrative corresponding to the ritual practice. Attis, the young lover of the goddess, was castrated and became her follower. Various rites were associated with the worship of Cybele, such as the *taurobolia* (slaughter of a bull) and *kriobolia* (sacrifice of a ram), perhaps dating from the 2nd century AD, when the initiate had to be drenched in the blood of a sacrificed bull or ram.

The Cabeiria was a mystery cult that took place in Samothrace and acquired importance second only to the Eleusinian mysteries. Ancient writers talk about the cult of the "Great Gods" in Samothrace. It is possible that the Great Mother of the Gods as well as Hecate and a certain Zerynthia Aphrodite were worshipped in Samothrace. Archaeology reveals that the shrines were active until the 3rd and possibly 4th century AD. As at Eleusis, the two important stages were those of preparation and initiation. But whereas in the Eleusinian mysteries one had to wait for at least a year between the two, in Samothrace they could be achieved on the same day. All the initiation rites occurred at night. The most important buildings found are the Anaktoron, where the initiation took place, built in the 1st century BC (but replacing an earlier structure), the Hiera Oikia (sacristy) where all the preparations were made, the Arsinoeion, built between 289 and 281 BC by Arsinoe, the wife of Lysimachus, a place for sacrifices and gatherings, and the actual shrine (Hieron). Many votive offerings have been excavated as at Eleusis, and it is possible to see the ruins of a theatre.

Cults associated with foreign gods such as Mithras, Serapis, and Isis were important in Greek religious life until late antiquity. Orgiastic cults continued to exist even after pagan times and within Christianity, and some blended into Christian ceremonies, although there was conscious opposition, particularly by Church Fathers. After the establishment of Christianity, many of the places that were important for ancient mysteries were destroyed, as happened at Samothrace.

Origen AD 184/85–254/55

Christian writer

As a native of Alexandria, Origen encountered the thought of Philo and the Valentinian "Gnostics", though he does not admit to learning much from either. He may have succeeded Clement as the head of the Catechetical school, and one of his works, the lost *Stromateis*, derived its title from his predecessor. He also found time to study with a teacher of Greek philosophy named Ammonius. This may be the same Ammonius who taught the Neoplatonist Plotinus, but those who identify the Christian Origen with Plotinus' fellow pupil of that name are merely cherishing an indifference to the facts. Origen's talents earned him first the patronage, then the enmity, of bishop Demetrius of Alexandria, and he migrated from the province to Caesarea, where his friends conferred on him the rank of presbyter. The breach with Alexandria was now irreparable, but in Caesarea Origen became an indefatigable teacher and a celebrated author, enjoying both the friendship of an empress and the general admiration of the Church.

Origen was the earliest Christian writer to make use of the Old Testament in Hebrew rather than Greek. The six columns of his *Hexapla* contained the Hebrew text, a transliteration of this into Greek characters, the Septuagint, and the later Greek translations or revisions made by Symmachus, Aquila, and Theodotion. Since he maintained the authority of the Septuagint against well-founded criticism, his object was more probably to establish the text of this than to replace it with a more accurate translation. Nevertheless, having had a "Hebrew" teacher, he acknowledged the Jewish canon (Eusebius, *Historia Ecclesiastica*, 6. 25), and his commentaries and homilies, which cover most of this and our New Testament, did not extend to the Apocrypha. The purpose of his exegetic writings was to bring every part of the Bible home to the thoughts and lives of his contemporaries; whereas his heretical precursors had appealed to uncanonical gospels, he applied the tools of allegory to the scriptures, introducing a distinction between the body, soul, and spirit of the text (*De Principiis*, 4. 2. 4 etc.). He argued that the spiritual sense was present everywhere, and might sometimes be the only one, as in the Song of Songs; but the bodily or literal sense was not discarded except when it appeared to condone absurdities, immoralities, or defections from the apostolic faith.

This faith he upheld at the greatest length in his eight books against the dead philosopher Celsus; they presented Christianity both as the heir of Judaism and as the philosophical antidote to the errors, pains, and vices of the world. This work, perhaps composed to mark the thousandth anniversary of Rome in 248, is largely orthodox, but in his earlier *De Principiis* (On First Principles), the first Christian experiment in systematic theology, he allowed himself more freedom in speculation. He appears to have held, for example, that our souls lived in a higher state with God before they descended into this world, where they must undergo a purifying chastisement for their sins (*De Principiis*, 1. 4 etc.). This process after death will be extended to the body, and, though each must attain perfection in his own time, the whole created order will eventually be saved (*De Principiis*, 2. 8–11 etc.). These views, whatever they owe to Platonism, rest on a fundamental tenet of Greek theology, that no one ever suffers more from God than he or she deserves. Equally seminal for Orthodox doctrine was his teaching on the Godhead, for he was the first to say that in this Trinity or triad of three hypostases the Spirit and the Son are coeternal with the Father, though their existence and activity depend upon his will (*De Principiis*, 1. 2, *Commentary on John*, 2. 10, etc.).

Origen undoubtedly saw himself as an exegetic theologian, whose reading of the scriptures was conditioned by the teachings and traditions of the Church. While he is glad from time to time to find a friend in Plato, he never takes a philosophical statement as his starting point or advances a conjecture that cannot be grounded on some sacred text. He takes it as an axiom that God the Word is present in every sentence of the

scriptures (*Philokalia*, 5), and says that in his use of philosophical tools he was "spoiling the Egyptians" to enrich his own understanding (ibid. 13). Even his anthropology could not be independent of his Trinitarian doctrine. The Spirit first converts us by addressing the rational element, next the Son instructs our souls in virtue, and finally the Father gives us everlasting life, wherein the spirit and the soul will be united to the proper kind of body (*De Principiis*, 1. 3. 8 etc.). The germs of the threefold mystical way – the purgative, the illuminative, and the unitive – are discernible in this scheme, but it neglects the body less than many later speculations. The Spirit is our sole guide while our body is still at war with us; when this has been refined by immortality, we can be at last "one Spirit" with the Lord.

Among his disciples Origen numbered Eusebius of Caesarea, who profited greatly by his scholarship, and Gregory of Nyssa, who adopted his universalistic theory of salvation. In Gregory's time, however, it was already necessary to borrow silently, for Origen stood accused of many heresies: for example, of believing in the transmigration of souls, of denying the resurrection of the body, and of making the second person of the Trinity inferior to the first. His heresies were exposed in the *Ancoratus* and *Panarion* of Epiphanius of Salamis, who seemed disposed to condone the anthropomorphite heresy rather than follow Origen in abandoning the literal sense of scripture. He charged him with denying not only the bodily resurrection, but the fall of man in Adam, and his tract in defence of the Septuagint suggests that he saw an insidious purpose even in the *Hexapla*. Origen was condemned in 553 by the Second Council of Constantinople, and in consequence most of his writings were destroyed. All that survives in Greek is a number of homilies, passages from the *Commentary on Matthew*, the greater part of the *Commentary on John*, the *Contra Celsum*, the treatises *On Prayer* and *To the Martyrs*, the newly discovered *Dialogue with Heraclides*, and the *Philokalia*, a compilation of excerpts made by Basil the Great and Gregory of Nazianzus. We depend on the Latin renderings of Jerome and Rufinus for most of the rest, including the *De Principiis*; but in the West the uncertain status of the Constantinopolitan Council has allowed such theologians as von Balthasar to pay more open tribute to his *Commentary on the Song of Songs*, a seminal work of Christian mysticism. Jerome's regard for Origen and Rufinus turned to hatred under the spell of Epiphanius, but it was Origen's example that inspired his Latin translation of the Old Testament from the Hebrew. In eastern Christianity Origen's influence, where perceptible, is a testimony to his intellect, his honesty, and the many abiding merits of his work.

MARK EDWARDS

Biography

Born in Alexandria in AD 184 or 185, Origen was educated at the catechetical school under Pantaenus and Clement and learnt philosophy from Ammonius. He may have succeeded Clement as head of the school before moving to Palestine in 215. He wrote extensively about textual criticism, exegesis, and systematic theology and was ordained a priest. Recalled to Alexandria, he was later banished and settled at Caesarea. He died at Tyre in 254 or 255.

Orphism

The term "Orphism" is somewhat ambiguous, as it is not clear exactly what it refers to. The ancients never spoke of Orphism but only about Orpheus, the presumed author of Orphic books, and of certain Orphic rites. A book became Orphic simply by being ascribed to Orpheus. The question of whether Orphism existed as a religious movement or merely as a set of beliefs described in the Orphic literature remains controversial. The rise of Orphic ideas and the nature of Orphic practices remain obscure despite some recent discoveries. The unifying factor, Orpheus, is a mythical figure of Thracian origin whose

main characteristic was a unique gift for music. This characteristic features in a number of ancient stories about Orpheus; he is said to have enchanted Hades with his song so that his prematurely dead wife Eurydice returned to life (cf. Plato, *Symposium*, 179d); to have taken part in the Argonauts' expedition and outsung the Sirens (cf. Pindar, Pythian 4. 167f.); and to have been beheaded by Thracian women while his head continued to sing (*Symposium*, 179d, *Republic*, 620a).

Through his achievements Orpheus appears as a great shaman – somebody whose spirit can affect the whole of nature, from plants and animals to souls and even gods or Hades. These achievements are often the subject of the Orphic poems, usually hymns or longer poems of theogonic or cosmogonic content, most of them now lost or only partially preserved. Such Orphic poems presumably started to circulate from the 6th century BC and they became popular in 5th and 4th centuries BC, as the testimony of various authorities suggests (e.g. Euripides, *Hippolytus*, 952ff.; Plato, *Republic*, 364e, *Cratylus*, 402b, *Philebus*, 66c, *Laws*, 829e). A relatively recent find, the Derveni papyrus, discovered in a tomb in northern Greece and dating from the late 4th century BC, contains a commentary on an Orphic theogony and proves that such Orphic poems were in circulation already in the 5th century BC. In the 6th century AD Damascius *(De Principiis*, 123–24), discussing the Orphic account of the beginnings of the world, talks of three Orphic theogonies, of which he had only indirect knowledge. According to the core of Orphic cosmogony Chronos, the primordial divinity, gives birth to Aether and Chaos and they generate a world-egg.

The link between these poems and a cult of Orpheus is difficult to determine. The Derveni papyrus, buried and burned with an unknown Greek, makes even clearer the close linking of religious practices to a specific text. Orphism seems to have been very much a book religion. Plato talks of purveyors of purifications and rituals which bring deliverance from unrighteousness, claiming that these people perform rites in accordance with books by Musaeus and Orpheus *(Republic*, 364e–365a). The most ancient testimony to Orphic practice comes from Herodotus. With reference to the prejudice against introducing woollen articles into temples or being buried in them, Herodotus says that this is an Egyptian custom and "in this they agree with the practices which are called Orphic and Bacchic, though they are actually Egyptian and Pythagorean" (2. 81). Herodotus is not the only one who identifies Orphic with Bacchic rites. In Euripides' *Hippolytus* (953) Theseus uses the verb *baccheuein* for Orphic rites. Archaeological evidence further supports the close relation between Orphic and Bacchic rites, and Orpheus often figures in artistic depictions of predominantly Dionysiac themes. Orpheus is sometimes said to be the initiator of the cult of Dionysus (Hecataeus), but at other times he is presented as having neglected the worship of Dionysus after his journey to Hades, instead venerating the sun (Aeschylus, *Bassarai*) for which his punishment was his assassination by a group of Thracian women. We hear of active *Orphikoi* in Athens and in southern Italy in the 5th century BC and we know of their distinctive views (e.g. Aristotle, *De Anima*, 410b28f.), but little is certain about their rites. Ancient sources speak of Orphic rites (*teletai*), though without giving precise information (Aristophanes, *Frogs*, 1032, *Rhesus*, 943; Plato, *Protagoras*, 316d), and also of participants in these rites (*Orpheotelestai*) (e.g. Theophrastus, *Characters*, 16. 11). Presumably the mysteries referred to, at least in some of those occurrences, are the Eleusinian mysteries. In some sources Orpheus is mentioned as their founder (Diodorus Siculus, 1. 23. 2f.), and Orphic mysteries are sometimes identified with the Eleusinian mysteries (Pausanias, 1. 37. 4). Orphic ideas indeed permeated the Eleusinian and also the Theban mysteries of the Cabiri. Orphics were particularly concerned with the purity of the soul, which was deemed to be imprisoned in the body. This purity was sought through an ascetic way of life with strict rules, especially about diet, such as abstinence from meat (Euripides, *Hippolytus*, 952–55; Plato, *Laws*, 782c–83c), but also from eggs, beans, and wine. Orphics believed in an afterlife and the transmigration of the soul, a feature which brings Orphism closer to Pythagorean ideas rather than to the Eleusinian mysteries. There is a certain common ground between Orphism and Pythagoreanism and perhaps some rivalry between them, to judge from such contradicting testimonies as that according to which Pythagoras and the Pythagoreans were the true authors of Orphic poems and that Pythagoras was indebted to Orpheus.

Orphic literature proliferated in the Hellenistic and the imperial eras. In the religious syncretism of late antiquity the name of Orpheus continued to fascinate, but now there was even less concern for demarcation between Orphic and other religious cults. A significant revival of interest in Orphic literature occurs with the Neoplatonists. Orpheus was now not only an inspired poet but also a theologian. The Orphic poems were interpreted allegorically and, under this interpretation, were held to be in accord with the doctrines of Platonic philosophy. The Orpheus legend had a considerable impact on Christianity. Although the Orphic rites were dismissed, the story of Orpheus charming nature with his music was interpreted as a prefiguration of Christ charming human souls with his teaching (Clement, *Protrepticus*, 7. 74. 3–6). Christ in his role of the Good Shepherd is said to be the new Orpheus (Eusebius, *Laus Constantini*, 244. 14–31). The figure of Orpheus which is often found in catacombs stands for Christ, who can also be depicted as Orpheus himself.

The Byzantines knew of the Orphic literature, which they still ascribed to Orpheus. The Orpheus legend was used as a metaphor of the power of poetry and music (Theophrastus of Ochrid, 1. 353. 3, cf. Arethas, *Scriptat Minora*, 2. 5. 27–6. 3, and Nicetas Choniates, *Orationes*, 129. 26–29). Psellos referred to Orphic rites (*Philosophica Minora*, II, opusc. 19. 48), while Anna Komnene contends that he emulates Orpheus in moving the souls of her readers (*Alexiad*, 1. 7. 14–20). In the 15th century Plethon showed vivid interest in the Orphic texts and Ficino translated some of them into Latin.

In modern Greek literature the presence of Orphism is striking. The impact of Orphic doctrines can be detected already in Palamas, but Orphism becomes prominent in the work of A. Sikelianos, who was very much inspired by ancient mystery religions. Orphic ideas permeate his early poems (e.g. his *Elaphroiskiotos*), but they become central in a series of lyric poems entitled *Orphica* (written between 1927 and 1942). Later in his life Sikelianos, engaged in the composition of tragedies, wrote *The Last Orphic Dithyramb* or *The Dithyramb of the Rose* (1932), a dialogue between Orpheus

and the chorus, which was actually enacted in Athens in April 1933.

Orthodox Church

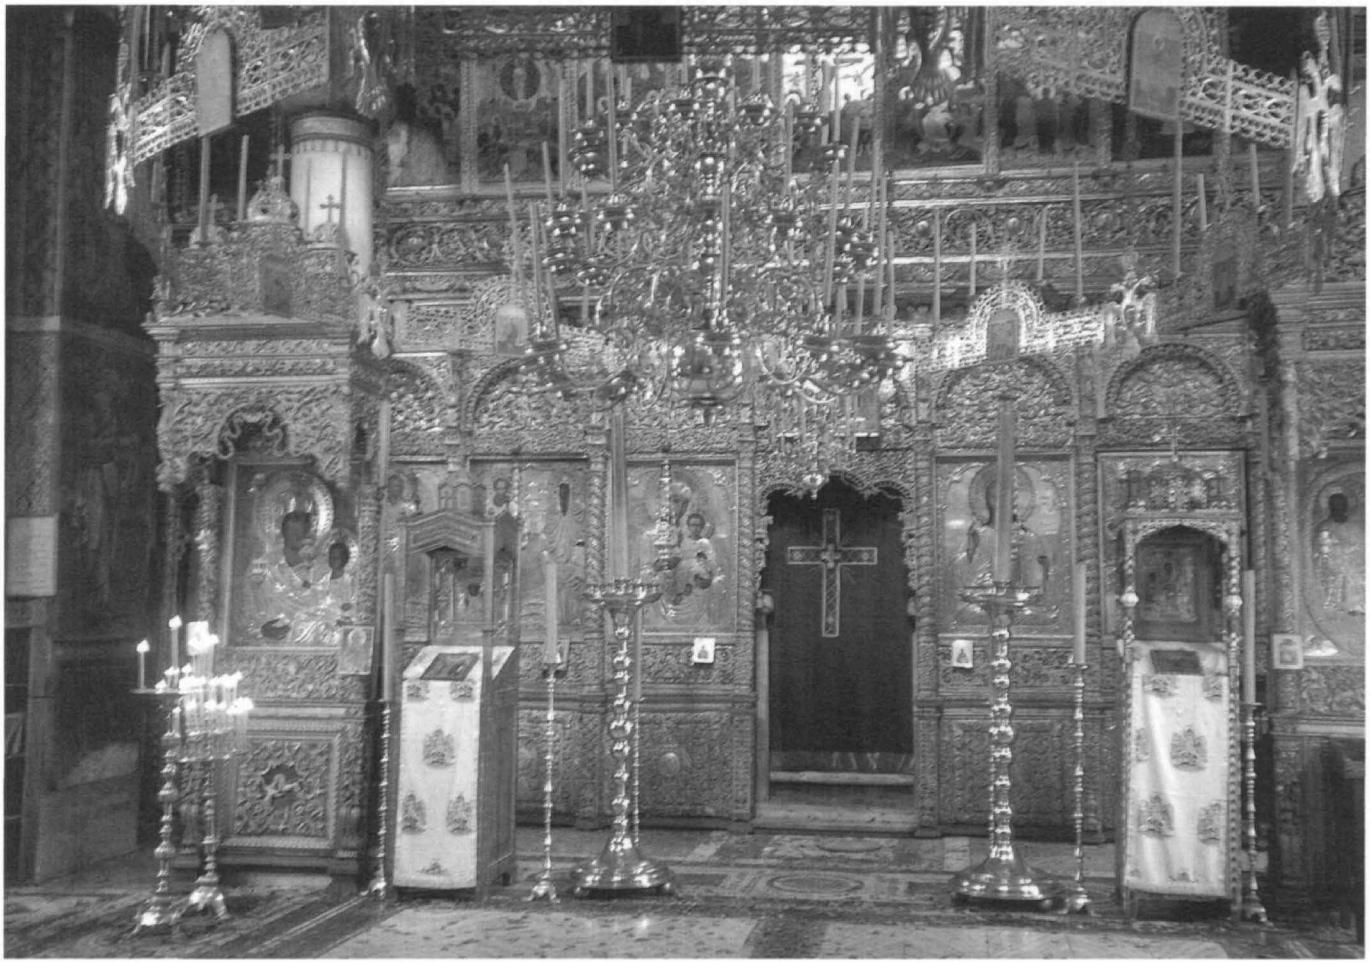
The Orthodox Church appears externally as a communion of self-governing jurisdictions – in 2000 the patriarchates of Constantinople, Alexandria, Antioch, Jerusalem, Moscow, Bucharest, Peć and Belgrade, Sofia, Georgia, and the archbishoprics of Cyprus, Athens, Warsaw, Tirana, and Prague (covering both the Czech and Slovak Republics). They are held together formally by mutual acceptance of each other's orthodoxy and canonical legitimacy; a common adherence to the decisions of the seven ecumenical councils, as also to the principle of conciliar and synodal government of the Church (going back to the apostolic council in Jerusalem) in general; rejection of the 8th-century (794) Frankish and 11th-century papal addition of the *filioque* ("and from the Son") to the affirmation in the Niceno-Constantinopolitan creed of 381 that the Holy Spirit proceeds from the Father; strong commitment to tradition, which includes both the Bible and much subsequent patristic teaching; and consequent opposition to any individual – whether the pope or other believers – altering or reforming that tradition without the consent of the ecclesial body at large.

Most important internally is a common manner of worship, centred around the eucharistic liturgies of St Basil and St John Chrysostom, but including numerous other service books, largely preserved as elaborated by the 9th century at the monasteries of Mar Saba near Jerusalem and the Stoudios in Constantinople. This shared tradition of worship represents for the Orthodox both a foretaste of God's kingdom and its already present reality. Even at a superficial level, committed Orthodox Christians almost certainly spend longer in ecclesial worship than most other Christians. Five examples of services of worship may illustrate some distinctive elements in the Orthodox tradition.

The *Chairetismoi* ("Salutations"), in the service books reserved to matins for the fifth Saturday in Lent, are in the Greek world sung partially on the four previous Friday evenings as well. The theological explanation for the service's popularity would be in terms of wonder at the Incarnation and devotion to the Mother of God. Furthermore, the rhetorical poetry is among the best in medieval Greek and still accessible to many Greeks today. Central to the service's creation historically, however, is the *Akathist* hymn (the title indicates that all remain standing throughout), written to celebrate the miraculous deliverance of Constantinople during the sieges by the Avars and Persians in 626, and by the Ummayads in 674 and 717–18. The central refrain – "To you, the general who fought for us, your city offers a hymn of victory" – retains such deep emotional resonance for Greeks that it is customarily chanted at moments of national exaltation or danger. Thus, whereas the service books transmitted to the Rus contained but one such service a year, today in the Greek world the hymn is central to five, an illustration of the close link between Orthodoxy and the history of those peoples who in their majority still adhere to it.

The matins service on four successive evenings from Palm Sunday announces Christ's arrival as bridegroom of the Church. Each believer acknowledges the absence of a wedding garment and hence unreadiness to join the wedding feast. No one who attends these services can doubt that Orthodox Christians share the common Christian insistence on personal responsibility. It is equally evident, however, that this is seen not primarily in terms of ethical norms (such as the Ten Commandments) but as an existential commitment and response to God (or lack of it), through such figures as the chaste Joseph and the unchaste but devoted harlot, the avaricious traitor Judas, and (on Good Friday) the repentant thief.

Western Christians have criticized Orthodox believers both as negligent of moral rules and as overly ascetic: the nub of any difference lies in the emphasis on personal response to God and one's neighbour, on the pattern of such parables as that of the Pharisee and the Tax-Farmer, the Prodigal Son, the Good Samaritan, and the Last Judgement, which are probably the Gospel passages most deeply etched in the ecclesial and individual consciousness of Orthodox Christians. Sin is seen less than in the West as a series of transgressions, and more as a falling-short from what is the best in human behaviour. This in turn is nothing less than the pattern set by Jesus, the Son of God incarnate. What God seeks of us then is what his Son



Orthodox Church: interior of the katholikon of the monastery of Chilandari, Mount Athos. Every available surface is decorated to create an image of heaven on earth

demonstrated on earth, namely fully human behaviour at the limit. This means sharing in the self-offering of his ministry, not acquring a sense of righteousness through the fulfilment of moral law.

The "Lamentation" service on Good Friday is the second most popular service in the Orthodox world. From Good Thursday the focus shifts to Jesus' Passion. Good Friday matins, sung late on Good Thursday, hymns Christ's action in redeeming us from "the curse of the law". There is also repeated emphasis on Jesus in his passion being simultaneously one of the passionless Holy Trinity. Furthermore the whole natural world is seen as participating in astonishment at the mystery of divine acceptance of such humiliation. The nub of the Lamentation itself, however, lies where Jesus' humanity joins with ours. We identify with someone who is betrayed by a friend; unjustly accused and condemned by his own people; condemned again, beaten, and executed by soldiers of a foreign power; and whose beloved ones, chiefly his mother, lament the deprivation of their most precious relationship through his death. The Orthodox Good Friday services dwell much less on the details of physical suffering than on the existential pain caused by death.

The fourth service, Paschal matins, is the most popular of all. Jesus' human experience was one of life lived, and in the end suffering endured, at its limits. What followed, namely the women's and then apostles' witness to his resurrection, implied something beyond a merely human drama, namely that God has involved himself in the human condition in order to encounter and heal its most basic problems. These are seen to be human subjection to physical, psychological, and conventional ethical law, with an ultimate end in physical death. The purpose of God's action is seen as making it possible for human beings to replace this bondage by a free and loving relationship with him and with other human beings, such liberation to be crowned by a life of eternal communion. Hence the Paschal hymn's repeated proclamation of Christ's defeat of death by death giving life to those in the tombs.

The Eucharist, less dramatic or obviously popular, has had the most continuous influence. It is not a meeting of individuals for common worship but the coming together of the local community to enter into communion with God, which explains why, in contrast to Western custom, there can be only one liturgy celebrated in any church by any priest on any one day. Each community is local but also universal, because through its presiding bishop it is in unity with all similar communities in the same thank-offering of praise.

The worshipping community approaches God both as creators in God's image, building, painting, adorning, preparing, serving, reading, and singing in the church; and as participants in its prayer of thanksgiving, praise, and self-offering.

God's response to this Eucharistic worship with the offering of the holy gifts of bread and wine, fruits of nature transformed by human hands, is, by giving himself, to bring those who pray into communion with him, revealed as three persons in an eternal communion of love, who calls human beings into communion among themselves as with God. This represents an even more fundamental sense in which human beings have been created in God's image, and can come to be in his likeness also.

It is from within the tradition of worship that one can best understand why certain issues that have exercised Western Christians have not much exercised Orthodox believers, whereas others are considered so vital that not a word may be added to or subtracted from the traditional formulation.

The Orthodox tradition did not develop a doctrine of predestination because it seemed at variance with Christ's ministry and the free response that this self-evidently demands from every human being. Neither is it seen as compatible with a loving Father, nor also is any concept of juridical satisfaction. Equally, long Western "either–or" debates on justification have frequently bemused Orthodox Christians, since to them the purpose of human life is to move into an ever closer relationship of communion with God.

It is indeed on the doctrine of God that Orthodox theology has concentrated. The first two ecumenical councils, of Nicaea (325) and Constantinople (381), elaborated a creed that is above all Trinitarian. In the earlier part of the 4th century St Athanasius of Alexandria taught that only if Jesus were as fully God as his Father could it be true that God had become man so that man might become God. In its latter part the Cappadocian fathers, St Basil, St Gregory of Nazianzus, and St Gregory of Nyssa, developed the doctrine of three persons and hypostases of God sharing a unity of nature. As St Basil expressed it, that unity of nature did not take priority: unity derived rather from the hypostasis of the Father, in a personal relationship of birth-giving with the Son and a personal relationship of procession with the Holy Spirit. In modern terms this means that ultimate reality lies in the eternal free and loving relationship of the divine persons, all three of whom are genuine subjects, not in the divine nature. The implications of this for life and liturgy have been illustrated above.

During the 5th to 7th centuries there were fierce disputes over the relationship between the divine and the human in the Son of God incarnate. The Council of Ephesus (431) determined that, since Jesus was Son of God at birth, Mary should be described as *Theotokos* or "Mother of God". The Council of Chalcedon (451), without denying that there might be legitimate use of one-nature language, elaborated what is for the West the classic statement of a two-nature theology. This caused ongoing schism in the East. The Fifth Ecumenical Council, in Constantinople (553), tried to bridge the divide. By accepting that a person of the Godhead had suffered in the flesh, it emphasized the priority of the divine person in relation to the two natures. This might have but did not heal the division, which had become ecclesial, dividing non-Chalcedonians from Chalcedonians in separate jurisdictions. Nor did the desperate attempt by emperors in the 7th century to assert that there were indeed two natures but only one will in Christ. Ultimately, and after the effective martyrdom of St Maximos the Confessor, one of the greatest Orthodox theologians, his view prevailed in the Sixth Ecumenical Council in Constantinople (680–81), namely that Christ, together with his divinity, had a fully human nature, including a human will and mode of activity.

If the Fifth Ecumenical Council conformed to imperial plans, the Seventh, held in Nicaea (787), like the Sixth, represented the defeat of a previous imperial position imposed through persecution on an important section of the Church. Iconoclasm had been resisted above all by monks and women within the empire, and by the Church as a whole outside it. In justifying the veneration of icons, St John of Damascus emphasized that it was through matter that God had worked out mankind's salvation and that veneration for the person materially depicted was intended not for the material object but for the person represented. Later opponents of iconoclasm pointed out that since the Son of God had become incarnate he could be pictured. This had the beneficial consequence of balancing concern regarding the exact relationship between the divine and human natures in Christ with a vision of Christ as one of the divine persons, who had become human.

There were other beneficial consequences. The Orthodox Church became pre-eminently a Church with a positive and indeed Eucharistic attitude to matter, encouraging its use in harmony with God and his creation, rather than for utility or self-gratification. The relevance of such an attitude in relation to our century's ecological crisis is evident. Then again, while the conciliar tradition had long antedated Constantine, and while he himself in presiding at Nicaea had worked to achieve a decision representing a genuine consensus by the episcopate, it was inevitable that emperors would use their power and quasi-religious status to impose their view. After iconoclasm emperors could be and were more easily resisted, if they presumed to take doctrinal initiatives.

Theological debate did not end with the seven ecumenical councils. There are at least two more that are considered by many Orthodox to aspire to ecumenical status. The first is the council held in Constantinople (879–80) under patriarch Photios, when all, including the papal legates present, decided against any credal insertion (meaning the Frankish *filioque*). The other is the council in Constantinople (1341) that supported the Athonite monks led by St Gregory Palamas in their distinction, taken from the Cappadocians, between God's nature or essence, incommunicable to human beings, and his outgoing energies, which could be and are received by humans, sometimes indeed in experiences that resemble the Transfiguration of Christ. A remarkable feature of the 13th to 15th centuries is the strong bond that linked those who shared this "hesychast" theology across ethnic boundaries in a comradeship and service to the cause of Orthodox Christianity, buffeted as it then was by Islam from the East and the papacy from the West.

Apart from the distinction between God's essence and energies, the theological initiative from the 13th century to the 19th lay with the dominant West. Many Orthodox were attracted by elements of Western thought and spirituality but the combination of military and jurisdictional aggressiveness prevented their general acceptance. Jurisdictional expansionism by the papacy was indeed even more effective than particular doctrinal or ritual disagreements in spreading and cementing the schism. Latin military success in Antioch in 1100 and in

Constantinople in 1204 entailed the replacement of an Eastern by a Latin hierarchy under papal jurisdiction. This was unacceptable to local Christians.

If the later papal claim to universal jurisdiction has created the greatest problems between the traditional centres of Christendom, other jurisdictional disputes have not been far behind. The doctrinal history of the 5th and 6th centuries was scarred by rivalries between Constantinople and Alexandria, Rome and Constantinople, Alexandria and Antioch. And if its missionary efforts among the Slavs and resistance to papal ecclesiastical imperialism made the patriarchate of Constantinople generally acceptable as the moving force in Orthodoxy for several centuries, especially effective in nurturing emergent Muscovy, this did not remain true for ever – Moscow itself, effectively autonomous from 1448, was acknowledged as an autocephalous patriarchate in 1589. Still less was it true during the emergence of nation states in the 19th century, which led to autocephalous national jurisdictions, bitter nationalist hostility between Orthodox Christians, and indeed secular control of many Orthodox Churches.

Again, if the Orthodox were the first Christians to object to Rome's ecclesiological hegemonism, they were slow in developing theological alternatives and have been positively remiss in implementing them. It was in mid-19th-century Russia that Alexey Khomyakov argued for *sobornost* or "conciliarity" as the basis for an Orthodox ecclesiology. This has been theoretically accepted but too often practically ignored or limited to such a narrow group as to lack meaning for the body of the Church as a whole.

Today jurisdictional disputes still mar the worldwide witness of Orthodoxy. The patriarchate of Constantinople's coordinating role as primus inter pares is agreed, but little else. The diaspora from the Orthodox heartlands remains largely though not totally split along ethnic lines and jurisdictional disputes exist in several traditional Orthodox lands as well. Most important, the fundamental equality of bishops is often sacrificed in practice to theologically questionable direction by central patriarchal or archiepiscopal bureaucracies, while within their own dioceses many bishops display a parallel indifference to the spirit of conciliarity. There are also Orthodox countries where the weight of history leads many bishops and ordinary believers alike to assimilate responsibility to Christ and the Church with national loyalties.

If in jurisdictional and ecclesiological terms the Orthodox Church falls short of its own standards, it remains true that its witness in the 20th century has been notable. Few Christian Churches at any period could point to numbers of martyrs surpassing those under Soviet rule. None has faced the full force of a totalitarian state for so long, without external support, and yet survived. Since about 1960 there has been a remarkable revival of monasticism, of missionary spirit, and of theological reflection among the Orthodox in many parts of the world, while, contrary to some Western prejudice, Orthodoxy has not in general proved an obstacle either to democracy or to the civil society.

It was inevitable that Orthodox participation in the theological debate of the 20th century would lead to some reformulation, but not that Orthodox Christian theologians should be so creative or influential. Theological revival had begun in 19th- and early 20th-century Russia; after the Revolution of 1917 a series of powerful Russian theologians, patristic scholars, and pastoral leaders worked in the West, among them Nikolai Berdayev, Sergei Bulgakov, Georges Florovsky, Vladimir Lossky, Alexander Schmemann, John Meyendorff, and metropolitan Antony of Sourozh, who has also attempted to realize the vision of Orthodox ecclesiology in his diocese.

From the 1960s there has been a contribution to the restatement of Orthodox theology both by converts to Orthodoxy, such as Olivier Clement and bishop Kallistos (Ware), and by theologians from other Orthodox lands, especially Greece. Best known abroad are Christos Yannaras and John Zizioulas, whose attitude to the West differs although their theology, both belonging to the Cappadocian tradition of acknowledging the free and loving communion of the persons of the Holy Trinity as the fundamental reality on which all else should be based, is related. As metropolitan of Pergamum, John Zizioulas is the foremost exponent of Orthodox ecclesiology and ecology alike. This last has been strongly supported by two successive patriarchs of Constantinople, Demetrios and, since 1991, Bartholomaios. Metropolitan Anastasios of Tirana has set a notable example through the manner in which he began rebuilding the Church in Albania, a witness all the more valuable for coming at a time when a revived combination of religion and nationalism has become as dangerous to Orthodoxy as it was a century ago.

The Orthodox attitude to the worldwide ecumenical movement, despite the enthusiastic participation of the late patriarch Athenagoras, and the help it gave to Churches then under persecution behind the Iron Curtain, has been ambivalent, suspicious of politicization but effective in attempting to develop points of theological consensus. There are also dialogues with all the major communions, which proceed at the same deliberate pace as dialogue among the Orthodox themselves. Although there have been important agreements on specific issues, it is unlikely that dialogue will bear rich fruit until the Orthodox see their way towards a gradual implementation of their ecclesiology in practice and are able to work out the relative weight of history and theology in the interpretation of tradition. It is clear, however, that many Orthodox, not least members of the international youth movement Syndesmos, are looking in these directions.

It is also clear that the Orthodox combination of humanity, as for instance in the tradition of a married priesthood, forgiveness of divorce, and, in the recent debate, acceptance of contraception, with a liturgical, ascetic, and theological outlook uncompromised by modernism and self-proclaimedly based on Christian tradition, has drawn forth an answering chord from many Christians in the West, after centuries of ignorance and contempt.

Orthodoxy and Hellenism

The encounter between Orthodox Christianity and Hellenism (traditional ancient Greek culture) was an event of great significance not only for European but also for world history. The intense, multi-faceted, and longsranding meeting of two different currents ranged from open hostility to dynamic interaction. Yet, it should be pointed out from the outset that in the so-called Helleno-Christian synthesis these currents were by no means equal partners, for Christianity was always in control of the situation. The appropriation or the rejection of the various elements that made up Hellenic civilization was carried out in most cases on the basis of Christian criteria and expediencies without taking into consideration the relevant Hellenic perspectives. This also explains the systematic Christian persecution of paganism in the Byzantine era as well as the understandable reactions of the followers of the Hellenic tradition.

Christianity, though initially a Jewish movement that originated in Palestine, soon came into contact with the prevailing Hellenic culture of the day, as evidenced by the "Hellenists", i.e. the Greek-speaking Jews, who might have adopted Hellenic customs as well (Acts 6: 1; 9: 29; 11: 20). Tension arose on the part of Jewish Christians when Gentiles were admitted to Christianity and the Christian Church started to expand in the non-Jewish world. Paul's confrontation with Hellenism at Athens provoked indifference and mockery (Acts 18: 32), for to preach Jesus crucified as the power and the wisdom of God was certainly a folly to the Gentiles (1 Corinthians 1: 23). These events marked the very early meeting of the emerging Christianity with the Hellenic world. Up to the era of emperor Constantine I (324–37), the Christian attitude towards Hellenism was conditioned by Christianity's delicate position in the Roman empire. The main intention of the Christian Church was to establish and legitimize itself in society as well as to evade Roman hostility and open persecution. Thus Hellenism was not initially the prime enemy, and Christian writers took varying stands on it. For example, in the 2nd century there were several Christian apologists (e.g. Justin Martyr, Athenagoras), who, among other things, tried to defend the new faith against the objections of the learned followers of Hellenism. Their interest also lay in discovering

Orthodoxy and Hellenism in harmony: a cenobitic brotherhood on Mount Athos

the positive aspects of Hellenic philosophy (e.g. Platonism) and incorporating them into Christian theology. In other cases, there were more systematic critiques and denigrations of Hellenic philosophy and religion from a Christian perspective (e.g. by Hermias, Theophilus of Antioch, Tatian, Clement of Alexandria, Origen, Athanasius of Alexandria). These attacks were in some cases caused by the reactions of pagan writers (e.g. Celsus, Lucian of Samosata), who tried to refute and ridicule Christianity.

The institutionalization of Christianity in the 4th century marked a decisive further development in its relationship with Hellenism. Paganism, as embodying the Hellenic religion and world view, was systematically criticized and attacked by Christian political and religious leaders. Despite some short-lived but unsuccessful pagan revivals (e.g. under emperor Julian, 361–63), the future of paganism was its inevitable extinction. Yet the 4th century also signified a turning point in the Christian appreciation of Hellenism. Secular wisdom, based on Hellenic philosophy, was deemed useful for Christian purposes. The Cappadocian Fathers, namely Basil of Caesarea, Gregory of Nyssa, and Gregory of Nazianzus, managed to incorporate Hellenic philosophy into the elaboration of Christian doctrine in their struggle against the various heresies. The articulation and systematization of "revealed Christian truth" was made possible through the use of the vocabulary of Hellenic natural philosophy, of words such as *logos*, *hypostasis*, and *ousia*. In this way, they successfully synthesized philosophical speculation with Christian teaching and dogmatics. The metamorphosis of Hellenic thought into the Christian framework involved simultaneously a critique and rejection of Hellenic myth, polytheism, and practice. Basil of Caesarea is known for his speech to Christian youth on how to profit from the Hellenic tradition by avoiding its erroneous doctrines and pitfalls. In general, the Cappadocian strategy proved to be an important and productive innovation in the development of Christian thought that was followed by many theologians in the following centuries. From this perspective, the development of early Christian doctrine was seen in terms of a process of "Hellenization".

In the Byzantine period the noun "Hellene" was used in a pejorative sense mainly referring to paganism, but also to denote a polytheist of any sort. Although the Hellenic language and culture were present throughout Byzantium, the simultaneous opposition to paganism persisted as well. The Church always feared any potential revivals of pagan rites, traditions, and world views. The Hellenic element in certain views of Origen was condemned by the Fifth Ecumenical Council in 553. The search for truth and certainty in Hellenism was also condemned by the Seventh Ecumenical Council in 787. The Church viewed suspiciously any preoccupation with the Hellenic tradition, especially if such study was pursued independently of the ecclesiastical tradition. Byzantium experienced such a Hellenic renaissance from the 9th century onwards; the philosopher John Italos was condemned in 1082 for serious deviations from Orthodox doctrine, while Michael Psellos was also suspected of being influenced by Hellenism. The charge of "professing Hellenism" was often brought in Byzantium to condemn specific doctrines derived from ancient

tradition, such as cosmology and anthropology. And the revival of the Hellenic tradition in the last days of Byzantium produced an important pagan thinker in George Gemistos Plethon, who hoped that the Hellenic religion would eventually replace Christianity. Nevertheless the term "Hellene" was used by the Byzantines to define themselves after the 13th century, despite the fact that the Church still disliked it. Yet the Orthodox critique of Hellenism was not blind and indistinctly articulated. Rather, the Byzantine Orthodox appropriation of Hellenism has been carried out in a gradual, careful, and very eclectic way on the basis of Christian principles. It is thus no accident that the portraits of several Greek philosophers (e.g. Socrates, Plato, Aristotle, Plutarch) are found in wall-paintings of some churches in the greater Balkan area and even on Mount Athos.

Under Ottoman rule the Church remained the principal bearer and promoter of the Byzantine tradition (*Romiosyni*) and its attitude towards Hellenism. It is true that an awareness of the ancient heritage existed among the Greek population at both a higher and a popular level throughout the Tourkokratia. The wide-ranging Hellenic revival, however, in pre-independence Greece, which was influenced by western interest in Hellenic antiquity, went hand in hand with a neglect of or even a critique of the Byzantine heritage in the context of the Greek Enlightenment. These events alarmed the Church, which feared an undermining of its authority and faced the threat of irreligion and atheism. It is no wonder therefore that in an encyclical of March 1819 patriarch Gregory V described the practice of giving Orthodox children Hellenic names as inappropriate. The same problem was encountered in the 19th century when religious decline and indifference towards Christianity were attributed to the widespread worship of antiquity. During that period there was also an antithesis between those who saw discontinuity in Greek history and those who supported the view that the Greek nation had continued uninterrupted throughout the ages. This controversy also touched on the debated correlation of Hellenism with Christianity, and the Hellenic and the Romaic models of identity, and was temporarily solved through the development of Greek historicism (e.g. in Konstantinos Paparrigopoulos's monumental *History of the Greek Nation*, 1864–75), while the term "Helleno-Christian" was first coined in 1852 by Spyridon Zampelios.

The relationship between Orthodoxy and Hellenism in modern Greece is an unresolved issue, and a matter of increasing complexity due to the serious problems of identity and orientation that Greek society continues to face. Apart from the difficulties with the West, an ideal synthesis of the Hellenic tradition with the Byzantine Orthodox Romaic heritage still remains a desideratum. Beneath the official rhetoric of the Church and the state about the allegedly harmonious Helleno-Christian synthesis, there lie a number of varying and even contradictory evaluations of both Hellenism and Orthodoxy, which attest to the persisting dichotomies of modern Greek culture. Thus, the various ways in which Hellenism and Christianity are correlated in modern Greece can be summarized in the following eight categories.

In the first place, there exists an extremely negative view of Hellenism from an Orthodox perspective and an emphasis on the incomparable superiority of Christianity. Hellenism is in principle viewed as an enemy and no more than a few harmless elements from the Hellenic tradition are accepted. This negative evaluation of Hellenism, especially on the basis of moralistic criteria, was expressed at the turn of the 19th century by the hieromonk Athanasios Parios, who reacted against the Hellenic revival of the day. Such a mentality was evident later in the thought of the popular preacher Apostolos Makrakis (1831–1905), who argued against the re-establishment of the Olympic Games. Today it is exemplified by the metropolitan of Florina, Avgustinos Kantiotis, who fears a pagan renaissance and who manifests an extreme reaction to any remnants of the Hellenic tradition. For example, he is not only against giving Greek Orthodox children Hellenic names, but against anything that is reminiscent of Greece's heathen heritage. These views are also held by most Greek Orthodox fundamentalists.

In the second category there is a more positive and balanced appreciation of Christianity's encounter with Hellenism and their dynamic interaction in history. This general perspective is shared by the official Church as well as by various ecclesiastical and theological circles. Such an Orthodox policy towards Hellenism does not rule out the possibility of an eventual conflict with it, especially when certain Hellenic remnants appear independently of the predominant Christian context. This is the main reason for the Church's disapproval of the *Anastenaria*, the fire-walking rituals in northern Greece.

The third category refers to the most positive correlation between Christianity and Hellenism and their smooth historical continuity, which is the line officially propagated by the Greek state, by the Church, and by the politicians. In the context of this mythology, the harmonious synthesis of these two traditions is extolled, for having given rise to the Helleno-Christian civilization, an unprecendented worldwide cultural phenomenon. In this case, all differences between them are minimized and considered unimportant, while the Helleno-Christian ideology is also incorporated in the national expediencies of the Greek state.

The fourth category has to do with the Neo-Orthodox current, which criticized the aforementioned attempts to correlate Christianity with Hellenism and suggested a specific approach to this question. The Neo-Orthodox objective was to find the diachronic features of the Greek way of life over a span of 3000 years, patent and latent alike. Thus, apart from any discontinuities between Hellenism and Christianity, there is a great span of Hellenicity that remains to be discovered and instrumentalized in contemporary Greece.

The fifth category refers to the practical, unofficial correlation of Hellenic/pagan and Christian elements in popular worship and rituals all over Greece. In many cases, the Church tolerates this fusion between official and popular religiosity provided that the non-Christian elements do not function independently. Such survivals were earlier used by ethnologists to demonstrate the continuity of Greek culture from ancient to modern times.

The sixth category deals with the private, idiosyncratic, and particular interpretations of the relationship between Hellenism and Christianity on the part of various intellectuals, artists, and men of letters (e.g. Kostis Palamas, K. Tsatsos). These are usually syncretic views, which have little in common

with the official state and Church ideology and belong to the personal worldview of these individuals alone.

In the seventh category we encounter various Hellenocentric currents, which promote the incomparable superiority of Hellenism over Christianity and criticize the latter as a Jewish religion. Christianity is accepted in some cases only if it discards its Jewish past and is Hellenized entirely in order to become truly the national religion of the Greeks.

In the last and eighth category there are various neopagan groups that emphasize the unbridgeable chasm between Christianity and Hellenism. They feel that they are in danger from the predominant Orthodox milieu in Greece, they intend to revitalize the Hellenic religion, and they ask for more freedom to express their ideals and visions.

This typology with regard to modern Greece attests to fundamental contradictions in the heterogeneous culture of the country. Despite the official propaganda and rhetoric by both Church and state, it is obvious that modern Greeks appreciate in quite varying and even contradictory ways their Hellenic and Christian past and the formation of Greek identity, which is still rent by major internal cleavages. In addition, the manifold influences coming from the West exacerbate this conflict and contribute to the serious identity crisis of modern Greeks in the contemporary global environment.

Orthodoxy and Nationalism

The interconnection between Orthodoxy and nationalism constitutes a much-discussed and debated issue, especially in the light of the radical changes in eastern Europe, the collapse of Marxism-Leninism, the conflicts in the former Yugoslavia, and the rise of previously suppressed ethnic groups. National awakening in eastern Europe including Greece has sought in the past as well as in recent times a necessary religious legitimation, for religion has often been used to harden national boundaries and to forge national aspirations. This poses the question of the relationship of the emerging nationalism to Orthodoxy. Nationalism in this context should be distinguished from ancient and later forms of patriotism, from love of one's own country, and from related visions and struggles. Nationalism as a modern phenomenon belongs to the new set of secular values that were germinated by the Enlightenment and the French Revolution and have been evident in the Balkans since the second half of the 18th century. There are a number of different ideas about Orthodoxy and nationalism in Greece today, promoted either by the Church and the state or by different religious, political, and intellectual circles.

Historically speaking, nationalism was always extraneous to Orthodox Christianity, which aimed to transcend racial boundaries and ethnic identities (cf. Galatians 3: 28) and become a universal religion (cf. Matthew 28: 19–20). The fact that Orthodoxy and Greek national identity are now closely related does not mean that this was always the case. The situation was quite different in the Byzantine empire, when Orthodoxy was officially used, among other things, as a means to unite this multiethnic sociopolitical unit. For this reason, nationalism has been repeatedly condemned by the Orthodox Church as a serious deviation from the authentic Christian spirit. Such a condemnation came from a synod of Eastern Orthodox patriarchs in Constantinople in August 1872, which castigated "phyletism" (nationalism) as a heresy. This calls into question a widespread opinion in modern Greece about the intimate relationship between Orthodoxy and nationalism, which regards Orthodoxy as the sole factor in safeguarding Greek ethnic identity under Ottoman rule and as the champion of nationalism. Such views, which are part of state propaganda and national mythology, often obscure the diversity of historical facts. Under Ottoman rule the supranational Orthodox Church, along with the communities and the family within the *millets*, preserved various ethnic identities mainly by distinguishing Christians from Muslims. This was a distinction of a religious and not of a national character. The Byzantine supranational ecumenicity was preserved by the spirit of the Orthodox Church, its great monastic centres, such as Mount Athos, and the Phanariots. Hence, the nationalization of the Orthodox Church is a much later phenomenon, while in certain Balkan areas (e.g. in Romania) the Orthodox Church, in isolation from the West, has clearly retarded national awakening.

The first serious encounter of the Orthodox Church with the nationalistic ideas coming from western Europe occurred during the Greek Enlightenment (1774–1821). The Church as well as the nobility of the Phanariots envisaged a restoration of Byzantium emerging from the fall of the Ottoman empire. What they had in mind was a supranational unit of Orthodox Christians, for example in the form of a Balkan Confederation or Commonwealth. In no way did they anticipate the foundation of a separate national Greek state such as the western powers and various Greeks, influenced by the Enlightenment, intended to bring about. This is the reason why the Church, in collaboration with the Sublime Porte, was generally against the spread of revolutionary ideas, which were given a strong impetus by the French Revolution, among Ottoman subjects. For the same reason, several Orthodox prelates did not regard the outbreak of the Greek War of Independence favourably.

Among the many influences of the Enlightenment on Greek thought were changes in the perception of history. Popular attention was directed away from the shared past of the Orthodox Christian peoples that had emerged after the fall of Byzantium to the search for a particular historical lineage in a remote and even mythical past as a means of distinguishing different peoples. In the case of the 18th-century Greeks, this meant their direct continuity from ancient Greece. In the area of political discourse, there was also a major change. The concept of the subject was replaced by the liberal notion of the citizen incorporated into a new sociopolitical and economic unit, the nation state, which led to the disappearance of localism and traditional communities.

All these profound changes, which were intensified by the French Revolution, had a destructive impact upon the tradition of the Byzantine Orthodox Commonwealth during the 19th century in the wake of the break-up of the Ottoman empire and the foundation of the modern Balkan nation states. The enmeshment of nationalist sensibilities in politics and religion even affected Mount Athos, a monastic centre where several ethnic traditions had coexisted harmoniously for centuries. It signified also the integration of Byzantium into the frame of specific national identities and aspirations, a development contrary to the spirit of that multiethnic empire. In the case of Greece, this happened after the foundation of the independent Greek state in 1832. The Orthodox Church was subjected to the state and was transformed into a national Church through a unilateral proclamation of its autocephaly after its separation from the patriarchate of Constantinople in 1833. Apart from this, it was later used in the service of a major nationalistic plan, the "Great Idea" (*Megali Idea*), that is, the restoration of the Byzantine empire and the liberation of many occupied lands (e.g. in Asia Minor) from the Ottoman yoke. The Greek Church, weakened by its structural defects and socially marginalized by the state, tried to acquire new ways of remain-

Orthodoxy and Nationalism: officers of the Greek Air Force take part in a religious procession on Mount Athos

ing vital and socially active. As a result, in attempting to revive the polymorphous role that it had played during the Ottoman domination, the Greek Church identified fully with the expansionist plans of the state and abandoned its traditional supranational character. This transformation took place in radical and diverse ways during the 19th century and continued into the 20th century as well.

Orthodoxy and nationalism are correlated in modern Greece in various ways. Mention must be made first of the specific perspective through which several Orthodox circles have viewed their history since the 19th century. In order to create an unbroken continuity from the past and to demolish the threat of Panslavist propaganda, they considered Byzantium and its civilization as "Greek" or as predominantly Hellenized. Such an interpretation of Byzantine history has triggered several heated debates. While the existence of Greek culture in the Byzantine empire cannot be denied, its "Greek character" should not be understood from a modern nationalistic viewpoint, for the Byzantines never considered themselves as Greeks in this sense.

Similarly, certain Orthodox circles in modern Greece think of the Orthodox *millet* during the Tourkokratia as Greek from a contemporary nationalistic perspective. The Greek control of the *millet-i-Rum* notwithstanding, this included Serbs, Romanians, Bulgarians, Vlachs, Albanians, and Arabs as well. The patriarchate of Constantinople, mainly in Greek hands, promoted various elements of Greek culture, but it was not the centre of a Greek polity. In many instances, it tried to dilute Greek elements by incorporating them into a wider Orthodox identity. The aforementioned supranational and unifying character of the Church, imbued with the Byzantine tradition, remained crucial throughout this period, though in the long run it too fell victim to the inescapable forces of nationalism.

Another specific aspect of the correlation between Orthodoxy and nationalism can be observed in the idealized interpretation of Greek history as a whole that has been introduced by some modern Greek theologians and intellectuals (e.g. by the Neo-Orthodox current). They have tried to identify the alleged diachronic principles and constants underlying Greek Orthodox civilization as distinct from that of the West. But their emphasis upon the uniqueness, exclusiveness, and superiority of Greek Orthodox culture has served as a basis for promoting nationalistic sentiments and ideologies. In addition, their demonic view of the West creates a mentality of separatism, isolationism, and fear ill-suited to today's global environment. Orthodox singurality is thus used as a remedy for the many defects of contemporary Greek society in comparison with the West.

Additional nationalistic features can be observed in the way certain Orthodox circles and individuals, usually fundamentalist-orientated, consider Greek Orthodoxy. They think that Greek Orthodoxy is a more authentic form of the original

Christian tradition, because the New Testament and many patristic texts were written in Greek. Consequently, they consider that Greek Orthodoxy is superior to other related faiths (e.g. Russian/Slavic Orthodoxy) and the Greek nation as the "new Israel" with a monopoly of the truth, a burdensome heritage, and a universal mission to save the world. Orthodoxy is thus considered the most crucial element in Greece's superiority over other peoples.

The most significant manifestation of the correlation between Orthodoxy and nationalism in modern Greece can be seen in the numerous ways that the Church and state collaborate. Although there is often tension in their relations, both of them usually legitimize one another and try to preserve their coexistence. The Church is officially hailed as a crucial protector of Greek national identity. The state is also interested in gaining from the promotion of Orthodoxy worldwide (e.g. in the Orthodox patriarchates of the east, in many former Eastern bloc countries), which is asumed to be the bearer of Hellenism and of national interests as well. Public opinion is influenced by this and tends to conclude that without Orthodoxy Greece cannot survive. Furthermore, the alliance between Greeks and Serbs in the recent Yugoslav war was also due to their common Orthodox tradition. Such policies have often provoked neighbouring peoples (e.g. in Albania) into fearing an expansion of Greek nationalism through the influence of Orthodoxy.

Through its enmeshment in nationalism, the Church looked for other ways of remaining socially influential, despite the fact that its social presence today is limited by its largely conservative and reactionary policies. On the one hand, the Church has created its own mythology and promoted its image as a bastion of Greek national identity throughout history. An aspect of this mythology is the widespread theory that the Greek nation (*ethnos/genos*) and Orthodoxy were identified under Ottoman rule. Such a theory is often used to consolidate the diachronic unity between Orthodoxy and Greek national identity and to oppose a separation between Church and state. On the other hand, the Church's involvement in Greek nationalism proved to be very useful from another perspective. Thus the Church was able to counterbalance its numerous structural defects and polish its tarnished public image. And its strong participation in national issues (e.g. the Macedonian question) alleviates to some extent the negative image it usually conveys in other areas.

The use of Orthodoxy to promote Greece's national interests has been criticized by several Greek Orthodox theologians and intellectuals. Yet the vision of a renewed Orthodox Commonwealth in the Balkans, far removed from national differences and divisions, seems to belong to a distant past due to the inescapable forces of nationalism. It is thus highly unlikely that the future in the Balkans will include a universal Christian empire with one emperor and one patriarch ruling jointly according to the Byzantine model. The development of historical realities since the 19th century has seriously challenged and finally destroyed this Byzantine ideal. The fact that Orthodoxy and nationalism are inextricably intertwined in a variety of ways in modern Greece therefore serves to show that such a common Balkan Orthodox future is illusory.

Ostracism

One of the most remarkable and at the same time controversial institutions of the Classical Athenian democracy was ostracism, a procedure whereby once a year any citizen (usually a leading politician), could be banished by a vote of the people. The term itself derives from the method of voting, which involved writing the name of the victim on a potsherd (*ostrakon*).

In the sixth prytany of every year the assembly voted by a show of hands whether or not to hold an ostracism; if it decided to do so, the ostracism took place in the Agora during the eighth prytany. The citizens voted by tribes in an enclosure, and if at least 6000 votes were cast, the man who received the highest number was obliged to leave Attica within ten days. He suffered no loss of citizenship (*atimia*) or property rights, but could not return to Athens for a period of ten years. The main ancient account of ostracism is found in the *Athenaion Politeia* (chapter 22), which attributes its introduction to Cleisthenes in 508/07 BC. Both attribution and date have been questioned, since ostracism was not in fact used for another 20 years; and a fragment of Androtion (Jakoby, *Fragmente de griekischen Historiker*, 324 fr.6, in Harpocration s.v. Hipparchus) has been taken to indicate an alternative tradition, that ostracism was introduced shortly before 487. However, the text of Androtion is very uncertain, and the *Athenaion Politeia* version is to be preferred. Later sources, notably Aelian (*Varia Historia*, 13. 24), record that ostracism was originally held in the Boule (council) and that Cleisthenes was himself the first victim of his own procedure, but this third tradition is also to be rejected.

The purpose of ostracism was to end rivalry between politicians that could potentially be harmful to the interests of the state. According to the *Athenaion Politeia*, Cleisthenes' original intention was to prevent future tyrannies, and it was subsequently aimed against those who were too powerful. Its early victims, indeed, were "the friends of the tyrants": Hipparchus son of Charmus (487), a relative of the tyrant Hippias; Cleisthenes' nephew Megacles (486), a member of the Alcmaeonid family that was suspected of attempting to betray Athens to the Persians at the battle of Marathon; and probably Callias son of Cratius (485), another supporter of Hippias. One sherd bearing Callias' name has a drawing of a Persian archer on the reverse. However, it is unlikely that ostracism, even though it was introduced in the aftermath of the fall of the Pisistratid tyranny, was designed specifically as a check on the tyrants, for which more direct and secure action could have been taken, and this seems very much like an inference from the identity of the first victims. Rather, it will have been introduced by Cleisthenes as part of his political struggle against Isagoras.

Later victims of the 480s were also connected with the Persians, at least by the voters: Xanthippus, the father of Pericles (484), had married into the Alcmaeonid family, and one *ostrakon* bears an elegiac couplet possibly associating him with their curse; Aristides (482) appears on another which claims he was a "brother of Datis the Mede"; while other *ostraka* refer to their victims as Alcmaeonids and "one of the traitors". But both Xanthippus and Aristides were recalled early under an amnesty passed in 480 before the Persian invasion. Other prominent victims of ostracism were Themistocles (*c.*470), Megacles again (sometime in the 470s; 4647 of the Ceramicus *ostraka* bear his name), Cimon (461), the elder Alcibiades (*c.*460), and Pericles' rival, Thucydides son of Melesias (443). The last man to be ostracized was the demagogue Hyperbolus (probably 416); the practice subsequently fell into disuse, though the law remained in force, and was replaced by the *graphe paranomon* (indictment for unconstitutional activity).

Over 10,000 *ostraka* have been found, on the Acropolis, in the Agora, and in the Ceramicus cemetery, and these record the names of over 130 different men. This suggests that there were no lists of candidates; and while those actually exiled will regularly have been ostracized for their political policies, other citizens clearly featured in the voting as a result of personal enmities. Indeed, Plutarch records the occasion when a voter wished to cast his *ostrakon* against Aristides, because he was tired of hearing the latter being called "the Just" (*Aristides*, 7. 7). That this citizen was unable to write the name of his victim is evidence for illiteracy in Classical Athens, although the procedure seems to presuppose widespread literacy. One find, of 191 *ostraka* on the Acropolis with the name of Themistocles, also has a bearing on this question, since they are written in only 14 hands, but furthermore is clear evidence for a concerted campaign against him by political opponents.

The fourth speech in the corpus of Andocides purports to be an oration delivered at an ostracism. The occasion is, however,

historically impossible, and it is extremely unlikely that speeches were made on the day of the voting. It is stated in section 6 of this work that ostracism was used only in Athens, but in fact there were similar procedures in other states, including Argos, Megara, and Miletus.

Otho 1815–1867

King of Greece

Otho, the son of Ludwig I of Bavaria, of the house of Wittelsbach, was selected by the three guarantor powers, Great Britain, France, and Russia to be the first king of Greece at the age of 17 by the London Protocol of February 1832. As he was still a minor, during the first two years of his reign he was guided by a three-member regency appointed by his father, namely Armansberg, Heydek, and Maurer.

Otho landed at Nauplia, the Greek capital, in January 1833 and was enthusiastically received after the ravages of a civil war that followed the assassination of Count Ioannis Kapodistria. Ludwig of Bavaria played an active part in making appointments of leading Bavarian officials for service in the Greek kingdom, thus prejudicing the country's independent status and alienating the Greeks from the Bavarian dynasty.

The regents set about creating a centralized and secular state with rationally designed institutions. For instance, they unified the legal system, the administration, and the army and in 1833 they created a Greek national Church, subordinating it to state rule, and severed its administrative ties with the Patriarchate of Constantinople. However, this programme was perceived by the civilian and military leaders of the 1821 revolution as a restriction of their privileged position. Moreover, the enormous task of state-building, which fell initially upon the regents, later on proved far beyond Otho's mental capabilities.

In December 1834 the nation's capital moved from Nauplia to Athens, and the following year King Otho became of age and the regency was terminated. Nevertheless, the Bavarians Count von Armansberg and Rudhardt served successively as heads of governments (in 1834 and 1837 respectively). The Greek army was still extensively manned by Bavarian officers and this period has been dubbed "Bavarian rule".

King Otho's Roman Catholic faith became an additional source of irritation for the Greeks. This was later compounded by the absence of an heir, who was expected to join the Greek Orthodox Church, and entitled Russia to interfere in Greek affairs as defender of Eastern Orthodoxy. Otho married Amalia of Oldenburg in 1836. One of the high points of his reign was the founding of the University of Athens in 1837, an institution which filled all Greeks with expectations of national progress.

Once of age, King Otho, sovereign by divine right according to his own perception of monarchy, sought to take control of government by interfering in its daily business. He wished to neutralize the effect of party activities by sending party leaders as Greek diplomats abroad and by short-lived alternating alliances with all Greek parties. As the parties were under the patronage of Great Britain, France, or Russia, his policy also incurred the favour or hostility of the respective "protecting" power. He was ultimately forced to yield to a general demand for a constitution by a revolt staged in Athens on 3 September 1843.

The constitution of 1844 was a compromise between the king and the political parties and put an end to Otho's absolute regime. The period of his constitutional reign began with Alexander Mavrokordatos, the leading figure of the English party, as Prime Minister for a few months. Ioannis Kolettis, the leader of the French party, followed for a period of three years, until his death in 1847. Through his close collaboration with Kolettis, Otho was able to control parliament and obtain a stable if ineffective government. After Kolettis's death the monarch assumed personal control of state affairs.

The king inherited from Kolettis the idea of Greek irredentism, the *Megali Idea* or "Great Idea", the driving principle of his personal foreign policy. As a destabilizing factor in the regional balance of power, Otho further alienated the Great Powers. The Crimean War in 1853 between Russia, and the western allies, Great Britain and France, over the integrity of the Ottoman empire, constituted a test for Otho's foreign policy. Otho and the Greek nation could not turn down the opportunity for territorial expansion. Despite the opposition of France and Great Britain, the king personally encouraged insurgency in Thessaly and Macedonia. The outcome was an occupation of the country by France and Britain between 1854 and 1857 and the establishment of a pro-ally government in Athens under Mavrokordatos. Otho's resistance to foreign pressure earned him tremendous popularity. However, the Russian defeat was a setback for Greek national hopes and the king's irredentist activities.

British enmity towards King Otho persisted throughout the remaining years of his reign and undermined his authority. During the same years university students and young intellectuals challenged Otho's absolutist methods of government and questioned the sincerity of his nationalism in a spirit of liberalism. An abortive attempt on Queen Amalia's life in 1861 was

followed by a revolt of the garrison in Nauplia in February 1862, which was suppressed by force. While the king toured the country to placate anti-dynastic sentiments, a rebellion spread from western Greece to the capital and on 10 October 1862 a revolutionary committee under Dimitrios Voulgaris declared the end of Otho's reign.

Thereafter Otho lived in exile in Bavaria, emotionally attached to Greece, and died in 1867. His reign is usually viewed in comparison to that of his successor, King George I. Posterity has tended to emphasize Otho's pedantry, stubbornness, and authoritarian methods of government. However, for his persistent irredentism he has been acknowledged as a patriotic ruler with the best interests of his country at heart, ready to stand up to foreign coercion. Finally, his state-building programme, with its distressing as well as its beneficial implications, has left a lasting contribution to the modernization of Greece.

KATERINA GARDIKAS

Biography

Born in Salzburg in 1815, the second son of Ludwig I of Bavaria, Otho was chosen at the age of 17 by the guarantor powers to be the first king of Greece. He landed at Nauplia, the capital, in January 1833. In 1834 the capital was moved to Athens. The country was ruled by a three-man regency until 1835. Otho ruled absolutely until 1844 when he was forced to accept a constitution. He married Amalia of Oldenburg in 1838 but she produced no heir. He was deposed in 1862 and lived in exile in Bavaria until his death in 1867.

Ottoman Period (Tourkokratia)

1453–1821

Tourkokratia, which literally translates as "Turkish rule", is the term used to designate the period during which the core territories that today comprise the Greek state were under the control of the Ottoman empire. Usually the dates given for this period are 1453–1821, that is, the year of the fall of Constantinople to the time of the first battles of the Greek War of Independence in the Peloponnese.

These dates are not wholly accurate, however. The year 1453, while by far the most symbolically evocative and memorable, was simply the moment that marked the definitive end of a centuries-long period of transition from Byzantine to Ottoman rule in Anatolia and southeastern Europe. The 1453 fall of Constantinople (described in the excellent eyewitness Greek accounts of Doukas, Chalkokondyles, Sphrantzes, and Kritoboulos) was merely the last of a long series of Byzantine defeats at the hands of the Ottomans. From at least the time of the 1204 sack of Constantinople during the course of the Fourth Crusade, the Byzantine empire could be said to have been in a serious state of "decline"; territorial losses had been suffered at the hands of invading Turkomans as early as the 11th century, most notably at the 1071 Battle of Manzikert, following which the Byzantines lost control over much of Anatolia.

Under Osman (1280–1324), founder of the Ottoman dynasty, all territory surrounding Bursa was taken by the Ottomans; Osman's son Orhan (1324–59) took Bursa itself (1326) and went on also to capture Nicaea (1331), Nicomedia (1337), and Scutari (1338). Orhan's successors, Murad (1360–89) and Bayezit (1389–1402), consolidated and expanded Ottoman rule over central Anatolia, and moved into Europe. By the time of Mehmet II's (1451–81) conquest of Constantinople, the city was the sole remaining island of Byzantium in a vast sea of Ottoman holdings.

Similarly, 1821 is not an entirely accurate date to give as the end of Turkish rule of Greece. It marks rather the very beginnings of independent Greek rule in the region. The vast bulk of territory now contained within the Greek state remained under Ottoman control long after 1821. Epirus, Greek Macedonia, and the island of Crete were gained in the course of the Balkan Wars, Thrace in the aftermath of World War I; the Dodecanese islands were joined to the Greek state only as late as 1947.

Throughout the course of the 19th century the dominant guiding principle of the Greek nation state was the *Megali Idea* ("Great Idea"), a grandiose irredentist-expansionist programme that envisioned the recapture of Constantinople from the Turks, the recreation of the Byzantine empire, and the extension of Greek territories to include all Greeks. As the Greek prime minister John Kolettis put it in an 1844 speech to parliament, "The Greek kingdom is not the entirety of Greece, only a part of it, the smallest and poorest part of Greece." This ideology unwisely propelled Greece into war with Turkey in 1897, in which Greece suffered a humiliating defeat. Some 25 years later Greece again went into battle with the hopes of liberating further supposedly Greek territories from Turkish control. The result in this case was the psychologically and physically devastating Asia Minor "catastrophe" of September 1922, in which the Armenian, Frank, and Greek districts of Smyrna (Izmir) were destroyed and over 30,000 Christians killed, and as a result of which the Greek military presence in Asia Minor was completely eradicated. Four months later (January 1923) a treaty was negotiated providing for the exchange of populations between Greece and Turkey. The result was that some 1.5 million Orthodox Christians were sent from Turkey to Greece in exchange for 350,000 Muslims living in Greece. Arguably, the final end of Toukokratia came only with this definitive death of the *Megali Idea*.

That the period of Ottoman domination was so long (no matter how one chooses to demarcate its beginning and its end) brings to the fore one central question regarding the history of Greece and the Greek people, namely, how did so disparate a group of peoples emerge from so lengthy a period of foreign rule, with some sense of national identity and group cohesiveness intact? That is, how were notions of "Greece" and "Greekness" cultivated, propagated, and disseminated over the course of Tourkokratia?

The answer, of course, is complex, and involves questions both of Hellenic continuity and of assimilation and change.

The assumption of continuity between modernday Greece and the Classical period is now widespread, but it is, historically speaking, a fairly recent formulation. The notion that contemporary Greeks were the direct descendants of the Classical Greeks, most particularly those of the 5th century BC, was first articulated by Georgios Gemistos Plethon in the 15th century, just years before the fall of Constantinople to the Ottoman Turks. During this early period of Tourkokratia, however, the notion of continuity with the Classical past was a minority one. When, with the fall of Constantinople, many of the Greek community's intellectuals emigrated to the west (most notably to Venice and its holdings), the idea of Hellenic continuity went with them. For the first three centuries of Tourkokratia, the dominant factor in the unification of the Greek people was not a sense of continuity with the Classical past, but rather with the more recent past age of Byzantium. Thus the Orthodox Church was the central institution in the consolidation and propagation of ideas of Greek communal unity.

Political as well as cultural factors contributed to the establishment of the Orthodox Church as the pivotal instrument of Greek cultural survival during Tourkokratia. The Ottoman conquest brought the far-flung Greek populations of the south Balkans and the Levant under the jurisdiction of a single ecclesiastical authority, the ecumenical patriarchate. During the Ottoman period, the ecumenical patriarchate, according to the Ottoman bureacratic system, enjoyed wide-ranging authority (both ecclesiastical and secular) over the Greek Orthodox populations of the Ottoman empire. Moreover, the ecumenical patriarchate had jurisdiction over all other Orthodox Christian populations of the empire – which included Arabs, Albanians, Bulgarians, Romanians, Serbs, and Vlachs. This remained an accepted feature of the Ottoman hierarchical structure until the 18th and 19th centuries, when these other Orthodox populations came to resent not just Ottoman dominance, but Greek Orthodox hegemony as well. This administrative arrangement meant that the patriarch was, in effect, the ruler of an empire within an empire. Indeed, he enjoyed the imperial privileges of raising taxes and administering justice, along with a host of other secular as well as religious interventions in the lives of his Orthodox subjects.

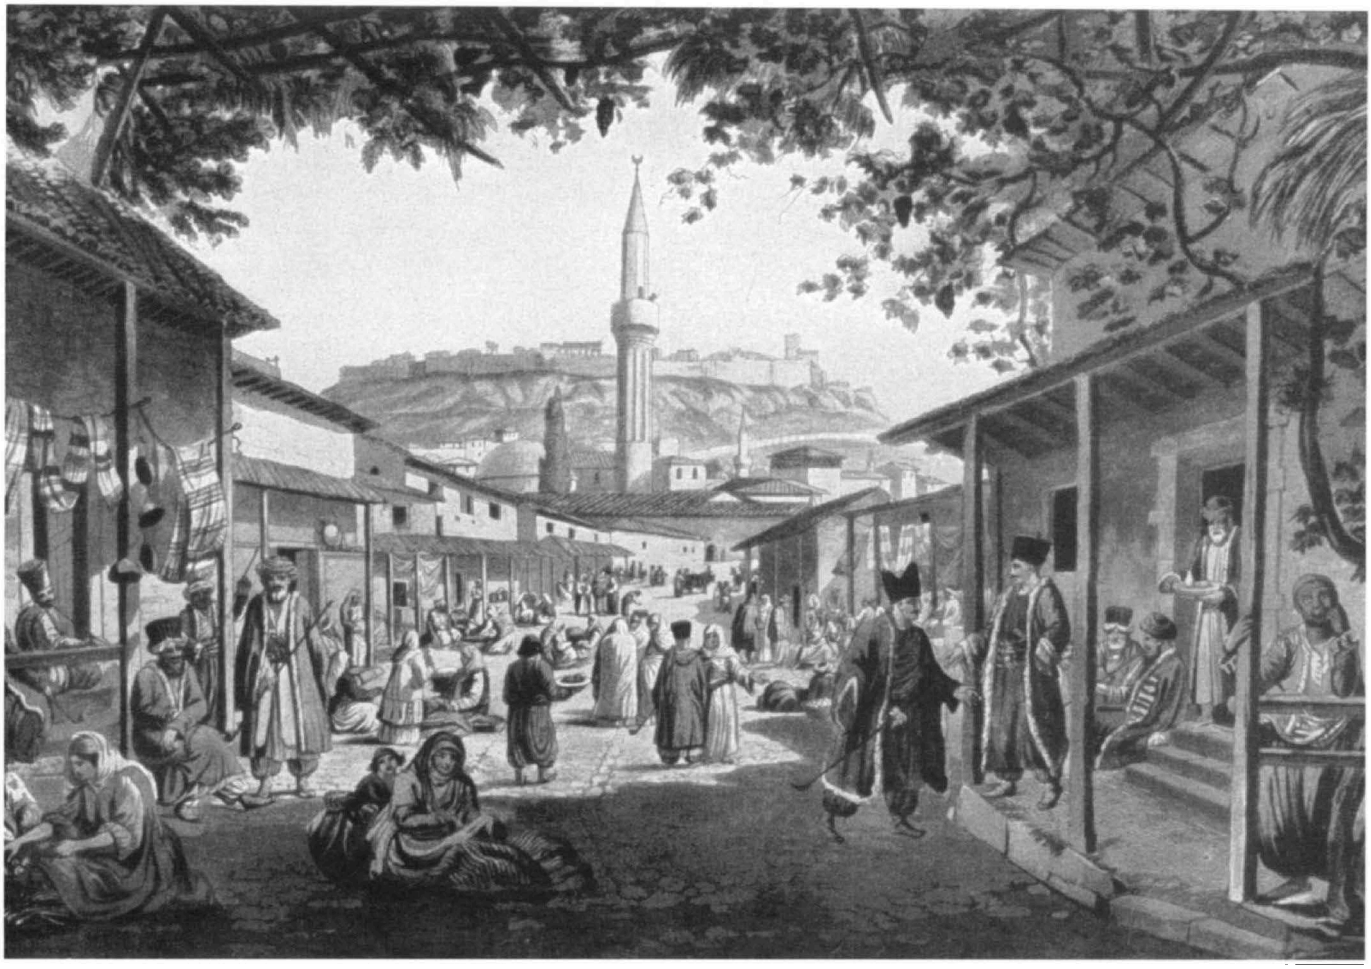
This administrative arrangement worked side by side with the cultural climate of the day to guarantee the centrality of the Orthodox Church to the programme of Greek cultural survival during the Tourkokratia. At the time of the fall of Constantinople it was widely believed that the Ottoman invasions were best seen as the result of divine intervention, as a punishment for the Orthodox peoples' conciliatory attitude towards the Latin (Roman Catholic) Church during the late Byzantine period. According to this formulation, the rule of Muslims (who would leave the Orthodox Church to its own devices) was preferable to the rule of Catholics (who would force a heretical form of Christianity upon the Greeks). Thus Turkish rule was viewed as both punitive and protective, as an event that reflected the will of God. Indeed, one strong strand of early modern Orthodox apocalypticism argued that "it was the will of God for the City [Constantinople] to be Turkified." This belief that the Tourkokratia was in some way the product of God's will later provided a strong justification for the Church's opposition to the Greek revolutionaries of the late 18th and early 19th centuries.

The highest levels of the Orthodox hierarchy, then, clearly fared well under Ottoman control. Indeed, they enjoyed wider-ranging administrative powers than had the Church of the later Byzantine period, they had control over a wide array of subjects (not only the Greek Orthodox, but all Orthodox peoples within Ottoman territories), and they were largely left alone by the Ottoman state.

It is somewhat more difficult, however, to assess the state of the vast non-elite sector of the Greek community during the Tourkokratia. The primary reason for this, of course, is related to the problem of available sources: whereas the Church and other official institutions are mentioned in Ottoman records, and kept their own records as well, there is little literary record for the vast bulk of the Greek populace during the Ottoman period.

One sector of the Greek populace that clearly fared well during the Tourkokratia, particularly during the later Ottoman period, was the mercantile bourgeoisie. During the course of the 17th century the Greeks of the empire became the dominant force in trade, both domestic and international. Of particular consequence was the Greek mercantile community of the diaspora – Greek business outposts were to be found throughout the western Mediterranean, in northern Europe, and in Russia, and as far east as Calcutta. These diaspora communities maintained close contacts with the Greek trade centres of the Ottoman empire (Ioannina, Thessalonica, Istanbul), and were responsible for the transmission to the Ottoman Greeks not just of material goods, but of European intellectual and political ideologies as well. Indeed, the rise of this commercial bourgeoisie was arguably the most important direct precursor to the 1821 War of Independence. Greeks of the diaspora endowed schools in Greece; organized Greek presses which printed educational and, later, revolutionary materials for Ottoman Greek consumption; and also were an important point of contact for the increasingly large numbers of Ottoman Greeks who travelled to Europe in pursuit of a university education.

The rise of Greek mercantile success is directly correlated to the beginnings of Ottoman "decline", particularly in Europe. Following the reign of Suleyman (1520–66), there were no further serious imperial attempts at expansion in Europe, and Greeks came increasingly to be the bridge between the Ottoman east and the European west. Because of their growing wealth and commercial influence, Greeks also came to play an increasingly influential role in the political workings of the empire. This was most evident in the case of the so-called Phanariots, a small Greek Constantinopolitan elite on whom the Ottoman government began to rely heavily in the late 17th and early 18th centuries. Valued for their linguistic abilities, they were used as the official translators in Ottoman negotiations with the powers of Europe, and came through this function to have a significant influence on the diplomatic relationship between the Sublime Porte and the west. Their role as translators gave them high office in the Ottoman imperial fleet, as a result of which the fleet itself came to be manned largely by Greek sailors from the islands. Members of the elite Greek Phanariot class were also appointed to important provincial posts in the empire, most notably in the Danubian principalities (Moldavia and Wallachia), where they served as *hospodars*, or princes.



Ottoman Period: Athens during the Tourkokratia. By the 19th century the Acropolis was in ruins and the rest of the city had shrunk to little more than a village.

The tale of Greek life under Tourkokratia is not, however, one only of success and continuity. It must be kept in mind that while the historical record tends in general to tell us about the "winners" (commercial, political, and intellectual elites), usually far less is recorded about history's "losers". While it is quite remarkable that the Greek communities of the Ottoman empire mainrained such a distinctive sense of identity and even flourished under Ottoman rule, the Greeks also suffered a number of economic and cultural losses as a result of Ottoman rule.

First and foremost, despite the relatively benevolent policies of early Ottoman sultans (most notably Mehmet II, under whose rule the city of Constantinople was captured by the Ottomans), sizeable numbers of Greek Orthodox Christians converted to Islam during the Tourkokratia. This tendency towards conversion was most marked in the 15th and 16th centuries, although it was a feature of Greek life throughout the Turkish period. In this early wave of conversions the greatest number occurred in the Greek Orthodox populations of Asia Minor, where it is thought that up to 50 per cent of the Greek population converted to Islam between the 13th and 15th centuries. Many of those who did not convert were assimilated linguistically, and used the Turkish language of their conquerors rather than the Greek of their ancestors. The result of this linguistic shift was one of the more interesting syncretisms of the Ottoman period, *karamanlidika*, a form of the Turkish language written (transliterated) in Greek script.

In addition to such gradually perceptible cultural shifts, conversions were also undertaken in dramatic and sudden fashion, at times by whole villages at a time. Such conversions were usually the result of financial pressures; Greeks who converted to Islam were spared the heavy tax burden of the empire's non-Muslim subjects, and could expect to enjoy other privileges as well. Some of these converts remained crypto-Christians (that is, in their private lives they continued to practise Orthodoxy, but for all official purposes called themselves Muslim), but the vast majority within the span of a few generations lost their connection with Orthodox Christianity.

During the final centuries of the Tourkokratia, when central Ottoman government was relatively weak, Greek subjects of the Ottoman empire became increasingly vulnerable to the predations of various provincial governors. Such governors, often of Albanian origin (as was the case with Osman Pasvanoglu of Vidin, Ali Pasha of Ioannina, and Mehmet Ali of Egypt), were, by the late 18th and early 19th centuries, far more interested in establishing their own political power than in acting as representatives of the Istanbul government. Greek populations living in their territories were thus subject not just to the usual imperial taxes, but also to whatever financial structures these governors chose independently to impose.

Thus, by the early revolutionary period Greek aspirations for independence were as likely to be articulated as opposition to such governors as to the Ottoman government itself. They also were likely to be articulated in anticlerical terms, for by the 18th century the Church hierarchy was widely regarded as a corrrupt entity which relished the privileges granted it by the Ottoman administrative system. Such resentments were cast in increasingly economic and class-based terms, as the Greek intellectual elites of the diaspora began in the wake of the French Revolution and the Napoleonic Wars to disseminate ideologies of nationalism and liberalism to the Ottoman Greeks.

The origins of Greek revolutionary thought are thus best identified as both external and internal, as a combination of factors accruing from the collective experience of the Tourkokratia, intellectual and political changes in Western Europe, Ottoman decline, and shifting perceptions of Greekness and Hellenic identity. The Tourkokratia has oftentimes been portrayed as a static, changeless period of Greek history, during which little economic, political, literary, or ideological evolution was seen. It is perhaps better understood as a fascinating time of Greek interaction with both the Islamic East and the Catholic and Protestant West; a time of gradual formulation of a new, distinct, Hellenic identity.

Summary

Dated from 1453 to 1821, the period of Ottoman domination of Greece in fact extended from early in the 14th century to well into the 20th. For much of the Ottoman period the ecumenical patriarchate in Constantinople exercised wide-ranging authority over the Orthodox peoples of the empire. Thus the Church was central to the survival of Hellenism. From the 17th century on, Greeks dominated trade in the empire. Diaspora communities also began to absorb ideas of Enlightenment from the West, leading to the formulation of a new Hellenic identity.

Ottomans

The Ottomans were a Turkish people who emerged in Asia Minor in the second half of the 13th century AD as the Seljuk empire declined. They rapidly became a threat to the Byzantine empire, but their expansion was momentarily checked by Timur, whose victory over the Ottomans at Ankara in 1402 gave a brief stay of execution to the weakening Byzantines by splitting the Ottoman territory between three rivals. When the Ottomans reunited under one ruler, they resumed their expansion at a slow rate designed to provoke response neither from Crusaders from western Europe nor from Timur's successors in Asia. Constantinople fell to the Ottomans in 1453, and they disputed the remnants of the Byzantine empire first with the Byzantine successor states and then with the Genoese and Venetians who had seized various ports and islands in the Aegean. Simultaneously they continued to absorb Syria, Palestine, Egypt, and north Africa, and to push northwards into the Balkans, until they were turned back at the gates of Vienna for the second and last time in 1685. Thereafter, the Ottomans went into a slow decline, exacerbated by the loss of the Peloponnese in the Greek War of Independence in the 1820s and cessions of Attica, Boeotia, and Euboea in the 1830s, Thessaly and Epirus in the late 1870s and the early 1880s, Macedonia and Crete in 1913, and Thrace after World War I. The last sultan was deposed after World War I, and Kemal Atatürk founded a secular republic which sought closer ties with Europe.

Osman, the eponymous founder of the Ottomans, was one of the beys who founded a *gazi* state on the marches of the Byzantine empire. As a *gazi* (warrior) state, his *beylik*, or principality, was devoted to waging *gaza* or holy war against the infidel, and this identification as a *gazi* state was to persist for many centuries, giving the Ottoman empire its raison d'être, at least until the conquests stopped. (Then, because the system had been geared to conquest and not to maintaining a static frontier, Ottoman institutions lost their dynamism and began to decay.) The Ottoman principality, like the other Turkish *beyliks* in Anatolia, was fostered by the pressure of population and need for expansion, the decay of the Byzantine frontier defence system, and the religious and social discontent in the Byzantine frontier areas. Additionally, the Byzantine empire, though substantially reunited after the fragmentation of the first part of the 13th century, never recovered from the Fourth Crusade in AD 1204, when the Crusaders, intervening at the instigation of the Venetians in a struggle for the succession to the Byzantine throne, took Constantinople and carved up the Byzantine empire among themselves.

Though the Ottomans formed only one of many Turkish principalities engaged in holy war against the Christians, they eventually outstripped their rivals as well as their enemies for several reasons. The other *beyliks* were fought to a standstill at the Aegean, so they turned from holy war to trade, and conse-

quently developed commercial and cultural ties with western European peoples such as the Venetians. This replacement of *gaza* with trade allowed leadership to pass to the Ottomans, who could demand support from the other Turkish principalities against the common enemy. The other *beyliks* also suffered from dynastic wars, because each bey would divide his territory among his sons and try to rule over them from the centre, whereas the Ottomans, facing greater external pressure, better preserved their unity.

Osman's successors reached the Dardanelles by 1345, allowing the Ottomans to intervene in Byzantine internal politics and establish a foothold on the peninsula of Gallipoli, thus opening the door to Europe. Murad I took Adrianople in 1361, forcing the Byzantine emperor and various Balkan rulers to acknowledge Turkish suzerainty and defeating the Crusaders at Nicopolis on the Danube. Attempts to centralize the state, however, ceased when Timur defeated Bayezid I in 1402. The defeat created a decade-long interregnum during which Bayezid's three sons contended to see who would rule the Ottomans. Mehmet I re-established unity in 1413, conciliating local rulers in Anatolia and Rumelia, the land the Ottomans took from the Byzantines in Thrace. In restoring unity, he was helped by the "men of the sultan" (*gilman*), who ran the empire and the army and who had a vested interest in the return of centralized authority, since they were uncertain of their position and rights as long as rival sultans existed.

The waxing of Ottoman power, and the concomitant waning of Byzantine power, were two sides of the same coin. The Byzantines were prey to political, social, and religious divisions. Civil wars and lack of central authority allowed local lords to do as they pleased, and the central administration was unable to loosen their grip on the estates it wished to return to its own control. The Ottomans, for their part, won the allegiance of the Christian peasantry by abolishing feudal and manorial rights and commuting feudal service into payment of a tax directly to the state. They also took the politically shrewd step of supporting the Orthodox Church. This put them on the side of the peasantry and against that portion of the Byzantine nobility that sought help from the Catholic world, so that the peasantry disowned their ruling class. Indeed, on the eve of the fall of Constantinople, the Grand Duke Loukas Notaras is supposed to have said, "Better the turban of the Turk than the tiara of the pope", speaking in this for many Byzantines and displaying an attitude that doomed last-minute attempts to gain strong western European support against the Ottoman assault on the city. The Ottomans also sought to cement their hold on newly conquered territories by settling them with Turks who would form a landed aristocracy that was expected to fight in time of war (the *sipahis*). Furthermore, the Ottomans maintained their legitimacy, and their status as *gazis*, by proclaiming any Muslim rivals to be rebels against religion. The Ottoman sultan claimed to be caliph, "commander of the faithful", though he could not prove descent from the Prophet Muhammad as required by Islamic law. Such a claim was only one of many tensions between Ottoman political practice and Islamic political theory, along with the tensions between *Kanun*, Ottoman administrative law, and *Shariah*, Islamic religious law, and over the position of Islamic scholars in the state.

Mehmet II, the conqueror of Constantinople, saw himself as the heir to a world empire. This stemmed in part from the heritage of Osman, in part from the teachings of Islam on sovereignty, and in part from his claim to be emperor of the Romans as a result of his conquest of Constantinople. Other Islamic states henceforth hailed the sultan as *Qaysar-i-Rum* ("Caesar of Rome"). Mehmet wanted to have all the religions in his empire under his watchful eye and saw to it that the Greek Orthodox patriarch, the Armenian patriarch, and the Jewish chief rabbi lived in his capital, which he moved from Adrianople to Constantinople. In fact, he made the Orthodox patriarch the head of *Rum millet*, or the community of Orthodox Christians. As the new capital, he rebuilt and resettled Constantinople, whose population had sunk dramatically under the last Byzantine emperors, using forced resettlement to increase the number of its inhabitants. He also tried to recreate the Byzantine empire under his own rule, eliminating the empire of Trebizond and the despotate of Morea, two Byzantine successor states which had sprung up in the wake of the Fourth Crusade, and occupying ports in the southern Crimea and, briefly, Otranto in Italy which had once belonged to the Byzantines. He eliminated the family of Gattilusi, related to the last Palaiologoi emperors, and therefore possible pretenders to the Byzantine throne. Mehmet's attempt to establish himself as the heir to the Byzantine emperors, and the fact that he spoke Greek and maintained a library of Greek books, led 15th-century authors such as Laonikos Chalkokondyles and Kritovoulos Imvriotes to hope that Greece would culturally influence the Ottomans as it had the Romans 17 centuries before, when "captured Greece took captive its uncivilized conqueror", as the Roman poet Horace once said. Islam, however, disinclined the Ottomans to accept the cultural legacy of infidels, so these hopes died stillborn.

Mehmet centralized the Ottoman state, seeking to consolidate the gains of the previous half-century. He put the *yeniçeri* or Janissaries under his own control and made them the nucleus of his army. He chose the grand vizir, along with the other officers of the state, from among his own slaves. Although he left the administration of justice to the cadis, he entrusted its execution to his own slaves. Thus he retained for himself the last word on finance, justice, and military affairs, especially as the grand vizir, powerful as he was, could not give orders to the commander of the Janissaries, for example. Mehmet's policies in claiming the legacy of the Byzantine empire led him into conflict with Hungary in the Balkans and Venice in the Aegean and Morea.

Mehmet's successors continued the policy of expansion into mainland Greece, the Balkans, and the Near East. The Shiite Safavids came to power around the turn of the 16th century in Persia, providing a bulwark against Ottoman expansion to the east, but Mehmet II's grandson, Selim I, defeated the Mamluks and took Egypt. The most successful of these successors was Selim I's son, Suleyman the Magnificent (1520–66), who continued the Ottoman expansion in the Balkans against the Hungarians and Austrians, forced Venice to cede its last strongholds in the Aegean and the Morea, fought the Persians, waged a naval war in the Indian Ocean against the Portuguese over the spice routes to Syria and Egypt from southeast and east Asia, and intervened in European politics, allying with

Ottomans: the governor of Mount Athos with the insignia of his office. Karyes was reckoned to be a hardship posting.

Francis I of France and the corsairs of Algiers against the Habsburg Holy Roman Emperor Charles V.

After the death of Suleiman the Magnificent on campaign against Austria in 1566, the Ottoman empire went into a slow decline over the next three and a half centuries. There are many symptoms of this decline, which themselves had a pernicious effect on the empire. After Suleiman the Magnificent, sultans rarely took to the field with their armies, or indeed interested themselves in the great affairs of state. Up until the early 17th century Ottoman princes had been sent out to rule *sancaks* (military districts) in Asia Minor and thereby gain practical experience of administration. When the sultan died, his sons scrambled to be the first to reach the capital and become the new sultan, since the losers would be strangled to obviate future civil wars. Such a Darwinian approach to the succession, with the losing princes killed *pour encourager les autres*, produced an excellent series of sultans down to Suleiman the Magnificent, as princes were encouraged to prepare themselves as much as possible to rule. After the early 17th century Ottoman princes spent their lives in idleness in the palace in Istanbul, waiting for their turn to rule, and the long and enervating confinement sapped whatever abilities the princes might initially have had.

This lack of interest at the top in governing led to abuses by the sultan's underlings. When the sultan did not rule his officials, they conspired to rule him. Faction and intrigue among the great personalities of the imperial court, including the *Valide Sultan*, or sultan's mother, the *Haseki Sultans*, or women who had borne the sultan a male child, and the Ottoman princesses who sought to advance the careers of their husbands and children, increasingly determined policy and too frequent appointment, dismissal, or transfer of high officials made administration less efficient, because it encouraged them to capitalize on the offices while they held them, to the detriment of longterm policies. In addition, the abandonment of the *devshirme*, or levy of children from the conquered populations, which filled the ranks of the *gilman*, opened civil offices to those who could most successfully intrigue or bid for them, not those best qualified to hold them through training and experience.

The system also showed the strain of prolonged warfare, though *gaza* had been the original basis for the state, and the advancing frontier had not only yielded material rewards, but, perhaps more importantly, an ethos and purpose to the Ottomans. Formidable obstacles hindered campaigns against the Persians in the east and the Austrians in the north: time and

distance, the opposite extremes of the arid climate of the desert in summer and the frozen climate of the Balkans in winter, and serious logistical problems attendant on operating armies far from Ottoman bases with 16th- and 17th-century methods of transport. The Habsburgs built a defensive barrier, further hindering the Ottoman advance, and the Ottomans in turn built their own defensive barrier, so war between them tended to become a conflict of sieges, shortened because an Ottoman army marching north from Istanbul at the beginning of the campaigning season in April would only reach the northern marches of Ottoman rule in late July or early August and so have only two or three months in the field before the end of the campaign season. In addition, the Ottoman army failed in the late 17th and 18th centuries to keep up with the tactical revolution in warfare brought about by the development of the mobile field gun and the flintlock musket. Furthermore, its budget was eaten up by pay increases for the Janissaries, who came to behave more and more like the Praetorian Guard in the Roman empire during the 3rd century AD, while the feudal landowners of Asia Minor and Rumelia, on which the Ottomans had relied for military manpower in earlier years, were hard hit by inflation and, from the beginning, excluded from the highest offices, which were only open to the *gilman*. Now the *gilman* intrigued for the estates which had supported the feudal aristocracy, and holders of these estates bought exemptions from service.

The position of Greeks under Ottoman rule was ambiguous. On the one hand, as a whole they were a conquered people, and mainland Greece languished in poverty, although the islands were slightly more prosperous, to the degree that Ottoman control was lighter. On the other hand, a small elite, inhabiting the Phanar quarter of Istanbul and therefore called the Phanariots, managed to win a privileged position for themselves under Turkish rule. They applauded the ultimately successful Ottoman efforts to expel the Genoese and Venetians from the Aegean and Morea, especially because the western Europeans were Catholic heretics who were preventing the revenues of their holdings from reaching the Orthodox patriarch in Istanbul and diverting the Moreot export trade for their own benefit. In addition, once the *devshirme* was given up and the *gilman* lost their grip on the civil offices in the state, Greeks took over from the Serbs and Croats who had filled such offices. Greeks filled the posts of Dragoman (translator) of the Porte and Dragoman of the Fleet, and the fleet itself was largely made up of Greek sailors. In addition, Greeks filled the offices of *hospodar* of Moldavia and *hospodar* of Wallachia, actually ruling those lands for the Ottomans. Both the Porte and the European embassies in Istanbul needed members of the relatively westernized Greek aristocracy to serve as go-betweens, and, by 1793, the permanent Ottoman diplomatic missions at Vienna, Paris, London, and Berlin had Greek Christian chargés d'affaires.

The Ottomans also did much to enrich Greek merchants by ruining their Italian rivals while themselves abstaining from commerce. Greek shipowners dominated the Black Sea and grain trades, and Greek business houses in Thessalonica developed a commercial network in Italy as well as in lands ruled by the Ottomans. The economy of the Ottoman empire as a whole, however, was stagnant, because it was based on agriculture and geared towards local self-sufficiency, not towards trade. In addition, despite repeated attempts at political and military reform throughout the 18th and 19th centuries, those running the empire found it difficult to solve the problems facing an empire that could not compete politically, economically, and technologically with the western European nations. The last of these reform attempts was led by the Young Turks in the early part of 20th century, and their miscalculations in foreign policy, which led them to support the Central Powers against the Allies and become involved in their defeat in World War I, brought an end to the Ottoman empire.

The War of Independence ended the relatively favoured position of the Phanariot elite in the Ottoman regime. Turkish reprisals against the Greeks can be symbolized by, though they did not begin or end with, the execution of the last Greek Dragoman of the Porte in 1821. British, French, and Russian intervention caused the Ottomans to grant independence in 1832 to a Greek state whose northern boundary ran from the Gulf of Preveza to the Gulf of Volos, though it was not until 1913 that a majority of Greeks lived under Greek rule.

P

Paestum

Greek colony in Campania

Paestum (Poseidonia) was an important Greek colony in Campania in southern Italy and is the site of well-preserved Greek temples. Located about 80 km south of Naples, Paestum is about 700 m from the sea and just south of the Sele river.

The site saw human habitation as far back as the early Stone Age; roving hunters moved through the area, leaving behind tool artifacts. Neolithic farming is evidenced from the archaeological record, and recent excavations have recovered remains from the Bronze Age, e.g. a large graveyard 1.6 km north of the city, and houses in the southern sector of the ancient walls. Sherds of Mycenaean pottery suggest some, though probably indirect, contact with the Greek mainland. In the environs of Paestum 8th- and 7th-century sites have been recovered.

Paestum was founded between 650 and 600 BC by colonists from the Italian city of Sybaris, which was itself a colony established in 720 near Croton on the Ionian Sea by Greeks from Troezen and Achaea. The city was called Poseidonia, or the City of Poseidon. At about the same time, the sanctuary of Hera at Foce del Sele was established about 8.5 km north of Paestum; this sanctuary included a temple, altars, stoas, and a treasury. In the 6th century BC Paestum flourished through trade with the Etruscan cities to the north. Its political importance increased when Etruscan influence waned and the mother city Sybaris was destroyed in 510 BC. Many of the Sybarites fled to Paestum, and this, coupled with the great fertility of the plains and the city's strategic position on the trade routes, caused a further economic boom. Around 400 BC the Italian people called Lucanians descended from the interior mountains and invaded Campania, soon taking over Poseidonia. The city continued to prosper, however, and enjoyed a strong, vibrant industry and commerce. Soon the Lucanians' expansionist policies brought them into conflict with the Greek cities further south, especially Tarentum. The Greeks called upon Alexander, the Molossian king of Epirus and brother-in-law of Alexander the Great, for assistance. Alexander was initially successful, reaching as far north as Paestum where he defeated the Lucanians in 332 BC. The following year, however, Alexander died and Paestum fell again under the rule of the Lucanians. Soon another power appeared on the scene: Rome. Rome gradually became involved in Campania in response to the Greek cities' calls for help against the Lucanians. In 280 BC Tarentum reacted to this intrusion in their sphere of influence by calling upon Pyrrhus, king of Epirus, for assistance. Pyrrhus was soon defeated, abandoning Italy in 275 BC and thereby allowing Rome to assume control of the whole of southern Italy. Rome established a colony at Poseidonia in 275 and renamed the city Paestum. The city's status became *socius navalis*; this meant that Paestum, although nominally autonomous, supplied Rome with a quota of sailors and transport ships (as opposed to land troops, as in the case of other Italian cities).

Paestum proved very loyal to Rome, even in the darkest times. Throughout the First and Second Carthaginian Wars of the 3rd century BC Paestum's loyalty never wavered – even when much of Campania and all of Lucania defected to Hannibal after the disastrous Roman defeat at the battle of Cannae in 216 BC, and even as Hannibal feasted in the city of Capua, just a few days' march to the north. Paestum also maintained allegiance to Rome during the Social War of 91–88 BC, when many of Rome's allied cities in central and southern Italy revolted in an effort to achieve full Roman citizenship. As a reward for its unswerving loyalty, Paestum retained the right to mint its own coinage until the 1st century AD. Later in that century the emperor Vespasian settled a number of sailors at Paestum.

Paestum's gradual decline began as early as the 2nd century BC. The completion of the great highway, the Appian Way, diverted the major trade route away from the southeast coastal area to the ports on the Adriatic. Even a new local road, the Via Polilia, bypassed Paestum. Despite a somewhat renewed building programme in the 2nd or 3rd century AD, the city suffered malaria epidemics as well as flooding and swamping due to the silting of local rivers. By the 5th century the city had been reduced to a village of houses clustered around the temple of Athena, which by now had been converted to a Christian church. There are records of a bishop residing in the city as late as the 7th century, and an 8th-century basilica was erected. In the 9th century the inhabitants moved to the hills because of constant raids by the Saracens.

Paestum contains some of the best-preserved and most important Greek temples in the ancient world. The city walls, with a perimeter of nearly 5 km, date to the 5th century BC, with renovations done in the subsequent two centuries; 24 round and square towers ring the walls, with four main gates.

The Greek city was laid out with two sacred areas in the north and south, separate areas containing public buildings, and houses laid out in gridlike blocks. The south sacred zone contains two magnificent temples, both dedicated to Hera. The so-called "Basilica", dating to *c.*550 BC, is extremely well preserved. The adjoining, mid-5th-century temple, also dedicated to Hera but erroneously called in earlier literature the temple of Poseidon, is one of the best examples of Doric architecture. The two temples formed the centre part of a sacred precinct of Hera. The northern sacred area contains the 5th-century temple of Athena (originally thought to have been dedicated to Ceres); its design is radical, being the first Greek temple to incorporate both Ionic and Doric elements. The Greek agora, or marketplace, was situated just south of the Athena precinct, as recent excavations have shown. A circular meeting-house (*bouleuterion*) and an underground shrine flanked this area.

The Roman colonists radically restructured Paestum in accordance with typical Roman city planning. A large forum was mapped out between the two sacred zones, with the *cardo maximus* and *decumanus* roads leading into the forum (the *cardo* even replaced the Sacred Way that had run behind the two Hera temples). The open court of the forum was flanked by such buildings as theatres, markets, baths, an ampitheatre, a gymnasium, and smaller temples.

Paestum is surrounded by important archaeological sites, many of which are still being excavated. Three major necropolises have been located, ranging in date from the 3rd millennium to the 4th century BC. The paintings of early 5th-century BC tombs are important for the history of Greek art. At Santa Venera, 1 km south of the city, a large sanctuary has recently been discovered; dated to the 5th century BC, the complex was dedicated to Aphrodite (not Bona Dea, as once thought).

Paestum is an extremely important city for the study of ancient Greek architecture, south Italian tomb painting, Roman city planning, ancient religion, and pottery and burial customs.

STEVEN M. OBERHELMAN

Summary

Founded between 650 and 600 BC by Greek colonists from Sybaris in south Italy, Paestum (then called Poseidonia) flourished as a result of trade with Etruria. In the 4th century BC the city fell to the Lucanians and in 275 BC to the Romans who renamed it Paestum. It was reduced to a village by the 5th century AD. Paestum has some of the best-preserved Greek temples of the Archaic and Classical periods.

Paganism

The word "paganism" derives from the Latin *paganus*, which literally means a peasant, villager, or rustic. Later on it came to signify the heathen, who drew their followers mainly from the rural population and thus were distinguished from the Christians, who were represented principally by the urban lower and middle classes. This article is concerned with the longstanding conflict between paganism and Christianity and with the passing from the ancient Hellenic world to the Christian Roman empire. The encounter of paganism and Christianity took place at various levels and exhibited different characteristics as it continued into the Byzantine period. Because the term "paganism" has also been used in modern times very broadly, objections have been raised to it. In the present context, however, it refers solely to the non-Christianized Hellenic world.

The institutionalization of Christianity as the official religion of the Roman empire by Constantine I (324–37) did not mean the immediate disappearance of paganism, which remained influential throughout the 4th century and had solid popular support. Under Julian (361–63) there was a short-lived, systematic, though unsuccessful attempt to revive paganism, which earned him perpetual Christian enmity. Outside politics, there were also a number of intellectuals who did not convert to Christianity and supported paganism, such as the rhetorician Libanius, who praised Julian's pagan revival. In addition, at the popular level people continued to adhere to pagan cults, sacrifices, and habits, especially in the countryside. These pagan survivals provoked the intervention of Theodosius I (379–95), who supported Orthodoxy, closed the oracle at Delphi, suspended the Olympic Games, and prohibited with harsh laws the celebration of pagan cults and the visiting of pagan temples. These measures resulted in the large-scale closure or destruction of pagan monuments.

Nevertheless, paganism did not become entirely extinct, and survived especially in rural areas. Sometimes there was a fusion between Christianity and paganism, manifested in syncretic religious remnants (e.g. in the northern Greek city of Philippi which was late entering the mainstream of Christian practice). It was Justinian I (527–65) who attacked the Hellenic past by forbidding the teaching of philosophy and law at the Academy of Athens in 529, and thus deprived paganism of a renowned

school of higher education, in which Proclus, Simplicius, and Damascius had excelled as teachers. The systematic development of Christian missions also had a negative impact upon pagan survivals in the Byzantine empire. These radical events signified the social marginalization and even the extinction of pagans in many places. Yet, pagan elements were incorporated into Christianity in various open and covert ways. Many Church Fathers (e.g. the Cappadocians) had a thorough knowledge of Hellenic philosophy and used it selectively in the articulation of Christian dogma. The Hellenic tradition always formed part of Byzantine education and culture, notably after the 9th and especially after the 12th century when admiration for Classical authors was strong. Pagan cultic places were often transformed into Christian churches for various practical or artistic reasons. And pagan rituals in transmuted forms were incorporated into or replaced by relevant Christian ritual activity. These cases show that the meeting of paganism with Christianity was multifaceted and ambivalent and that under certain specific conditions remnants of the ancient religion coexisted with Christianity.

Certain aspects of paganism survived in the later centuries of Byzantium, manifested in everyday life and habits as well as in local cults, especially in the countryside. This continued to provoke Christian reactions. Canon 62 of the Council in Trullo of 692 explicitly condemned the continuation of pagan practices. In the 9th century the existence of some "Hellenes" is mentioned in the southern Peloponnese (Laconia) by Constantine VII Porphyrogennetos. In the 12th century the learned archbishop Eustathios of Thessalonica in his work *De emendanda vita monastica* (On the Improvement of Monastic Life) criticized the groups of monks who organized raiding parties in Greece and destroyed pagan temples. Paganism was defeated in the long run mostly for external reasons (e.g. persecutions, barbarian invasions), but also for internal reasons (e.g. stagnation and lack of innovation, the elitism of later pagan leading figures, isolation). The Church, despite its selective appropriation and conditional acceptance of Hellenic elements, always tried to keep them under control and feared their autonomous presence and function. During iconoclasm both parties accused one another of paganism. A preoccupation with the study of antiquity and ancient philosophy was often viewed suspiciously and led at times to accusations of professing paganism, especially during the 10th and 11th centuries, as the trial of the philosopher John Italos in 1082 demonstrates. The Church was particularly critical of any attempted revivals of paganism to the detriment of Christianity. The most conspicuous case from late Byzantium was that of the Neoplatonic philosopher George Gemistos Plethon in Mistra, who attempted to redirect Byzantine society and culture towards hitherto neglected Hellenic sources. Plethon believed in the Olympian gods and constructed a pagan system with a calendar, prayers, hymns, and liturgy. Yet his vision was not only unrealistic but was also met with Church reactions, and his book *On the Laws* was burned after his death by the patriarch of Constantinople Gennadios II Scholarios.

During the Tourkokratia there was an awareness of the Hellenic past at both the intellectual and the popular levels, albeit in many cases diffused and mixed with various beliefs and superstitions. However, growing signs of a Hellenic – but not strictly pagan – revival among the subjugated Greeks can be observed especially in the late 18th and early 19th centuries and in the Greek War of Independence, which had been given a strong impetus by European Philhellenism, Neoclassicism, and Romanticism. This renewed interest in Greek antiquity was viewed suspiciously by members of the Orthodox Church (e.g. patriarch Gregory V and the hieromonk Athanasios Parios), who feared that it would lead to indifference to Orthodox spirituality and tradition. This worship of antiquity was current in 19th-century Greece too and was closely connected with the conflict between the Hellenic and the Romaic–Byzantine models of Greek identity. It is no wonder therefore that various strategies were developed to overcome this cultural schism by attempting to view Greek history and culture diachronically as a unified system (e.g. the Helleno-Christian synthesis, which survives to this day). It should be noted, however, that in these attempts Hellenism was usually taken out of its pagan context and set up on the basis of Christian criteria. Yet, Orthodox fears of a pagan restoration were evident in the 19th century as the accusations against Theophilos Kairis in 1838–39 and A. Makrakis's opposition to the re-establishment of the Olympic Games in 1896 show. Such developments forced other Greeks in turn to emphasize the pagan character of the Hellenic tradition and the fierce confrontation of paganism with Christianity in history (e.g. the anti-Christian tragedy *Julian the Apostate*, written by Kleon Rizos Rangavis [1842–1917], which was entered for the Voutsinaios prize and provoked the Church's reaction).

In modern Greece elements of the pre-Christian Hellenic tradition still survive and are evident in popular customs, rituals, and worship, even within a Christian framework. These were identified from the late 19th century onwards by the now discredited "survivals" approach of folklorists in their attempt to show the diachronic unity of Greek culture. Idiosyncratic pagan trends and remnants can also be observed in several contexts, ranging from A. Papadiamantis's flirtation with paganism in the old sense and the continuing sanctity of place, to the Delphic festivals of A. Sikelianos. There have also been attempts to revitalize elements of Hellenic culture and its religious tradition in ways that would help the country to face the challenges of the modern world. This revival has nothing to do with the historical, patriotic, and national promotion of ancient Greece, which is done systematically by the state and others. Rather, it aims at a more serious acquaintance with the spiritual founts of Hellenic civilization with a view to re-establishing them. These Greek organizations and currents can be subsumed under two overlapping categories: "Hellenocentric" and "neopagan".

The term "Hellenocentric" refers generally to a wider Hellenic revival, expressed in various forms, with an emphasis on Greece's ancient heritage and usually at the expense of the Orthodox tradition. The most characteristic trend in this category is centred around the monthly journal *Davlos* (Torch), published since 1982 and devoted to all aspects of Hellenic culture. The common features of this trend include: the promotion of elements of Hellenic culture and the unique, unparalleled contributions of the Hellenes to universal civilization (in language, writing, politics, democracy, science, technology, philosophy, theatre, and athletics); the superiority of the Hellenic race, spirit, and culture worldwide as the only real

alternative to the deep crisis of the West, since Hellenes are to be regarded as an autochthonous population designed to become leaders of the world; the fundamental antithesis and unbridgeable chasm between Hellenism and Judaism and the devastating criticism of the Old Testament and Zionism; the need to purge Christianity completely of its Jewish background and give to it a more Hellenic character; the sharp critique of Christianity's intolerance and persecution of dissidents over the centuries; and the rejection of hybrid combinations of Hellenism and Christianity (e.g. the Helleno-Christian synthesis, nationalistic Christianity, the *Romiosyni*-theorists, the Neo-Orthodox proposals) because of their artificial nature. Needless to say, similarly idiosyncratic views are expressed by other groups and journals as well as by individual authors.

The second category, which basically shares the features of the above groups, but is distinguished from them by its more explicit relation to paganism. It aims not only at reactivating the cultural values of ancient Greece, but at re-establishing the Hellenic religion as well. The traditional conflict between Christianity and paganism lies behind these efforts. The term "(neo) paganism" is used today to indicate various currents (e.g. in the USA and Britain), including an earth-respecting spirituality, goddess worship and spirituality, witchcraft, healing practices, magical rituals, various festivals, Gnostic elements, occultism, spiritualism, shamanism, ecology, nature religion, and other elements. It is, however, important to distinguish such broad esoteric movements from certain ethnic neopagan awakenings in various European countries (e.g. Odinism/Druidism in the Anglo-Saxon world, Romuva in Lithuania, Romanism in Italy). The ethnic character of this particular form of neopaganism points to the authentic, ancestral, and autochthonous traditions in various countries that existed long before the importation of Christianity and which differ fundamentally from revealed religions.

Modern Greek neopaganism has a predominantly ethnic character and remains in close relation to the Hellenic tradition and religion. The latter are considered comprehensive cosmogonic, psychological, and eschatological systems aiming to provide people with a serious religio-philosophical meaning of life. There are various independent neopagan groups, whose aim is the defence of the pre-Christian tradition and the creation of Hellenes in the literal meaning of the word. They criticize the pseudo-worshippers of antiquity, the Hellenized Christians, the New-Agers, and the Hellenized nationalists and fascists, because they all disregard the importance of the Hellenic religion and use antiquity for selfish purposes and objectives. The neopagan attempt to de-Christianize or de-Byzantinize modern Greece is evident in many instances (e.g. in the use of the Hellenic months and calendar of feasts as well as in the replacement of BC and AD by more neutral chronological indications). Thus, neopagans not only consider a correlation between Hellenism and Christianity as impossible, but they depict their multiple anthitheses in the most negative way. They also organize some relevant festivities (e.g. to celebrate the summer equinox) and sometimes have their own private places of worship. There are several such groups and movements: the Diipetes, which publishes a journal of the same name with the subtitle "In the Defence of the Ancient Psyche"; the Ellines Eidololatres, the Megali Ethniki Ekklisia ton Ellinon, the Desmos ton Achaion, the Phaethnos Ethniki Ekklisia, the Ypato Symvoulio ton Ellinon Ethnikon, and their related journals. It should be mentioned that these groups do not accept as their self-designation the terms "neopagans" and prefer some other terms such as "Gentile Hellenes" (Ellinikos Ethnismos) or "Followers of the ancestral Hellenic religion and way of life" (Archaiothriskoi, Archaiotropoi, or Ellinotropoi).

It goes without saying that these trends have met with the staunch opposition of the Orthodox Church, which has officially condemned the independent function of pagan ritual survivals (see the encyclicals 2565/24 January 1994 and 2598/19 June 1995 against the *Anastenaria*, the fire-walking rituals in northern Greece). Similar but more extreme is the reaction of Orthodox fundamentalists who are against anything that is reminiscent of the Hellenic past and religion (e.g. the ceremonial lighting of the flame at Olympia for the Olympic Games). This is because Orthodox Christianity has developed a specific understanding of and attitude towards Hellenism in general that is clearly incompatible with Hellenocentric or neopagan visions. Yet, the latter, though marginal and not especially influential until now, reveal a variety of orientation patterns that unavoidably contribute to the persisting crisis of modern Greek identity.

Painting

Ancient

The origin of Greek painting is difficult to ascertain. Ancient literature is filled with references to famous painters and paintings, but very few paintings survive. Archaeological evidence provides some knowledge of the painter's craft and subject matter. There are specific descriptions by Aristotle, Plutarch, Pliny the Elder, Quintilian, Lucian, Cicero, and Pausanias. They extol the artistic talent of the Greeks, whose art was avidly collected and used to adorn public and sacred buildings. Among ancient painters, the most celebrated were male, yet it was not an exclusionary craft; Pliny names female artists as well. The gradual evolution from painted temple metopes and plaques, stelae, wooden panels, and pottery resulted in painting so illusionistic that horses were said to neigh when confronted with a painted image of another horse.

Antecedents of Greek painting occurred during the Bronze Age cultures of the Minoans and Mycenaeans. Murals on the palace walls of Crete and Thera were partly influenced by Egyptian art, but the subject matter and function appear to be completely different. There is an inherent liveliness and naturalism in the landscapes, figures, and animal motifs. Topics are religious (funerary or sacrificial rituals) or purely decorative. In both cultures marine and floral motifs were depicted on vases. Mycenaean painting is related to Minoan art, with military themes and abstraction becoming evident.

In Greece vase painting arose *c.*900 BC with the Geometric period. Figures were black silhouettes formed by circles, triangles, and squares. During the Orientalizing phase there was progress in distinguishing musculature and identifying facial characteristics. In Archaic black- and red-figure vase painting males and females are presented in mythological or everyday scenes. Overlapping figures indicate depth. Details are scratched into the dark figures for drapery, hair, and other features. Red-figure painting allowed for greater expressive freedom by using a brush loaded with paint for details rather than a stiff etching tool. From the second half of the 6th century BC artists' signatures are common, the painter writing *egrapsen* ("he drew") after his name.

According to one legend, drawing began in Greece when a woman traced the outline of her lover's shadow on the wall. Ancient writers relate that great achievements in Greek mural and panel painting occurred during the 5th and 4th centuries BC. The use of flat colours within an outline progressed to forms modelled in light and shade; buildings were depicted in perspective; and figures and objects were illusionistically set into space using cast shadows. The most celebrated painters, who included Polygnotus, Apollodorus, Zeuxis, Parrhasius, Pausias, Nicias, Apelles, and Protogenes, were renowned for their ability to create *trompe-l'oeil* effects on flat surfaces. Many paintings were on panels that could be transported to cities and art markets, thus spreading the fame and fortune of the artists.

In the early Classical period Polygnotus from Thasos was regarded as the "inventor of painting", completing huge murals depicting the lives of the Greek heroes. He used four colours in his palette: white, red, ochre, and black, and in various combinations. His most famous subject was a series of paintings of the Trojan War placed in the Propylaea on the Acropolis. His ethnic depictions were especially celebrated and spectators could read the thoughts of the characters from their expressions.

During the later 5th century BC Apollodorus of Athens developed the use of shadows and perspective. Pliny stated that Zeuxis "entered the gates of art which Apollodorus had opened". Pliny's description of the painted grapes of Zeuxis

reveals a new peak in illusionistic art: birds flew at the panel to peck at the fruit, though his rival, Parrhasius, painted a curtain so convincingly that even Zeuxis was fooled. Parrhasius of Ephesus lived in an ostentatious manner, wearing a purple cloak and golden wreath around his head and singing as he worked.

An important representative of the school of Sicyon was Pausias, who is associated with improvements in colour. In an allegory of *Drunkenness*, a glass bowl was rendered so realistically that a woman's face was reflected in it. Many of his panels were taken to Rome by admirers to decorate the imperial capital and villas of aristocrats. In the Athenian school Nicias was highly esteemed and fits our contemporary picture of the passionate artist. He was so involved in his painting that he would forget to eat. Nicias was very particular about his subject matter as well, saying that what one painted was as important as how one painted. As with Pausias, many of his paintings were brought to Rome; one was placed in the Roman Senate, another in the temple of Concord.

Apelles, the favourite painter of Alexander the Great, is the artist who surpassed his contemporaries and predecessors in skill, fame, and fortune. He left his native Ephesus for Sicyon to complete his training and was taken by Philip of Macedon to his capital Pella when his talent was recognized. Upon Alexander's accession, Apelles became the court painter. He used a thin black glaze to unify his compositions and enhance the brilliance of the paints. Apelles was by all accounts a pleasant man and supportive of his friends. He apparently purchased several paintings by Protogenes at a high price to show his appreciation of his friend's work. Protogenes of Rhodes lived in poverty most of his life but remained dedicated to art, probably saved from starvation by the generosity of Apelles.

Several female painters also achieved a high level of success. Helena, daughter of an Egyptian, is credited with the *Battle of Issus* depicting Alexander's defeat of Darius from which the famous mosaic copy in Pompeii was made. Pliny names quite a few others: Timarete, who painted an Artemis at Ephesus; Eirene, painter of a maiden of Eleusis; Calypso, who painted portraits; Aristarte, who painted Asclepius. Iaia of Cyzicus mostly did commissioned portraits of women as well as a self-portrait with the use of a mirror. She was noted for the rapidity and excellence of her work. Her paintings sold for much higher prices than those of her contemporaries. Another painter, Olympias, is known only for her pupil, Aristobulus. In some cases, the women were daughters and pupils of other painters whom Pliny names. Iaia remained single all her life, devoted to her craft.

There are numerous Graeco-Roman murals in Pompeii, Herculaneum, and other small towns nearby which were perfectly preserved by the eruption of Vesuvius in AD 79. Unfortunately, the paintings are unsigned; some are possibly copies from famous compositions done by Greek painters. The murals themselves have been categorized into four basic styles ranging from simple reproductions of marble surfaces to elaborately conceived and depicted landscapes, architectural compositions, portraits, and panel paintings set within ethereal frames.

Byzantium

The two arts of painting and mosaic may be separated in modern thinking, but in the Byzantine mind they were one, and such evidence as there is suggests that the same craftsmen practised in both media, using mosaic when money was available, and painting where it was not. Furthermore there is a lack of surviving painted church decoration between the 4th and 11th centuries. This account must therefore be read in conjunction with the article on Byzantine mosaic.

Byzantine painting can be defined as the painting of the Christian Roman empire that continued until the fall of Constantinople in 1453. Since Rome had more or less conquered Greece in the 1st century BC, and Roman culture was thoroughly Hellenized, it follows that the strongest influence on early Byzantine painting was the style of the Classical world. This can be seen in the surviving paintings of the catacombs in Rome, where the subject matter is derived mainly from the Bible, but the style shows simplified Classical figures and landscapes. A second influence, less well charted because less has survived, was Jewish and oriental. Scenes from the Old Testament can be seen painted on the walls of the synagogue of Dura Europus, a city on the Euphrates on the borders of modern Syria and Iraq.

Byzantine painting can be divided into three phases: early Christian and Byzantine up to the period of iconoclasm (726–843); middle Byzantine, from 850 to the sack of Constantinople by the Latins in 1204; and late Byzantine, from 1261 to 1453. The early years of Christian painting were clandestine and rudimentary, depicting symbolic images such as fish or peacocks and simple biblical scenes. The conversion of Constantine the Great in 311 heralded official church building on a grand scale, and all of the churches required painted or mosaic decoration. The usual form of church was the basilica, and the ruins of these can be found all over the territory of the late Roman empire. Little is left of their painting or mosaic decoration because of the widespread destruction of images during the iconoclast period of the 8th to 9th centuries.

The salient difference that emerges between the Classical temple and the Christian church is that the decoration of a temple was concentrated on the exterior of the building, whereas the decoration of a church was largely within it. A

form of painting and mosaic that originates in the Classical world is the individual portrait or icon. Small portable icons executed in mosaic have been discovered from the Roman period, and portraits painted in encaustic from the Hellenistic period in Egypt are well known. These are the prototypes of the Christian icon which became as significant to the individual worshipper as were church decorations to the act of corporate worship. Another form of painting that was to assume even greater importance as the centuries passed by was the illumination of the Bible and of other Christian devotional manuscripts. Bible illustration seems to have provided the earliest subject matter, and while prototypes for Old Testament illustration may have been found in Jewish painting, an entirely new iconography was invented for New Testament scenes and figures. For the Old Testament, the Quedlinburg manuscript of the 5th-century AD provides evidence for what was expected of a painter. The actual illustrations have largely flaked away and underneath are simple written instructions directing the painter to make images of the people relevant to the biblical scene, and put in the buildings or landscape and animals relevant to the text. In this way a new iconography was evolved that changed little over the Byzantine period and the experienced observer can usually identify a scene even if only a small fragment of it remains. Another form of early Christian painting that must have been widespread is pilgrimage souvenirs, such as the Vatican Palestinian reliquary depicting the Crucifixion and other Christological scenes. This type of image may well have spread Byzantine iconography throughout the Christian world.

The Byzantine style of religious painting can be seen as already well evolved in a few surviving icons in the monastery of Mount Sinai, notably the 4th- or 5th-century panels of *Christ* and *St Peter*. In manuscript, the Rabbula Gospels (now in the Biblioteca Medicea Laurenziana, Florence) and the Rossano Gospels (in the cathedral museum at Rossano) already show the increasing use of gesture and linear drapery lines to exaggerate the sense of movement and emotion in a symbolic way. By contrast the survival of strongly Hellenistic elements can still be seen in manuscripts such as the Paris Psalter of 950–70, but in general the great 10th-century manuscripts show a fusion of styles with the figures developing increasingly linear effects but architecture, landscape, and other subsidiary elements retaining more from the Hellenistic past. The only painted church decoration of note from the 10th century is in Tokali New Church in Cappadocia and this has a marked linear quality. In the early Christian period, Byzantine painting can thus be seen to inherit forms and techniques from the ancient world while constantly striving for liberation from them.

The encaustic technique of painting on panels with a wax medium was inherited from the Hellenistic art of Egypt, and it was commonly used for icon painting up to the 6th century. Thereafter it was superseded by the use of glues, egg, and oil media. On walls Byzantine painters used the fresco technique of painting on fresh lime plaster, and then finishing with an egg or glue medium for colours that were incompatible with lime. Fresco painting was known in ancient Egypt, Greece, and Rome but the Byzantines modified their inherited craft and adapted it to the increasing linear emphasis that appears in Christian painting from the 6th century onwards. Rome and ancient Greece had striven for the softer effects of blended colour that gives the illusion of realistic depth in a painting. The Byzantines rejected this in favour of linear patterning that emphasized the otherworldly nature of images and placed them in a spiritual dimension suitable to a religious image. For this purpose the Byzantine technique evolved with a use of thick opaque colours that are often juxtaposed in contrasting sequences close to each other.

The conflicts of style and subject matter that characterize the early period of Byzantine painting more or less disappear in the period 850–1204. The Iconoclast controversy served to focus agreement in the mind of the Church hierarchy. A theological justification for the use of images was worked out by St John of Damascus, and the idea that a church represented heaven on earth became widely accepted. The acceptance of this premise meant that scenes depicting the life of Christ and the Virgin and images of the saints were not just didactic illustrations for the benefit of the congregation. The scenes and images were held to bear a constant and continuous reality by virtue of their illustrated presence and the congregation was absorbed within them and partook of the sacred drama. Christ was present by virtue of his image, usually in the dome, and from thence he looked down upon the congregation and was with them. Similarly it was possible to communicate directly with the saints through their painted image. This belief that the image provided a direct contact with the spirit of the figure portrayed may itself be seen as a continuing reflection of the ancient Greek belief that a god was directly accessible through his or her statue and in some magical way he or she was even present in the statue. A new architectural form evolved for this new conception of a church. Domes were added to the simple basilican plan, and the plan evolved into the centralized domed church usually in the form of a cross-in-square. The painted icon continued to serve its purpose as a focus of worship for the individual owner, but increasingly icons became a part of corporate worship in the altar screen or iconostasis of a church and in religious processions.

The continuity of Hellenistic illusionism can best be seen in the middle Byzantine period in the grander manuscript illustrations such as the Paris Psalter of 950–70, which was made under imperial or aristocratic patronage. Individual illuminations in such a manuscript might almost be mistaken for antique works, but elsewhere the surviving tradition was less obvious.

The best coherent survivals of church decoration of the period 950–1100 are in the crypt of the church of Hosios Loukas in Stiris, in the New Church of Tokali in Cappadocia in Turkey, and in Hagia Sophia at Ohrid in Macedonia; there are a few provincial examples surviving in Italy, Egypt, and Cyprus. All of these churches bear witness to parts of the post-iconoclastic system of iconographic order: the image of Christ in the dome; the Mother of God in the semidome of the apse; the great feast days celebrating the life of Christ on the upper walls and in the vaults of the church; the first communion of the apostles on the apse walls; and the company of saints in the ground register or distributed wherever there might be a space such as in the soffits of arches or in decorative borders. In Cyprus good-quality examples of this orderly church decoration survive from throughout the 12th century. Another group of painted churches in Cappadocia represent provincial deco-

Painting (Byzantine): St Saviour in Chora, now known as the Kariye Cami, Istanbul, apse, fresco of the Resurrection, *c.*1315–21

rative work of the middle Byzantine period. The style of painting varies considerably throughout the Byzantine empire according to place and date, but all the quality work shows adherence to an orderly rule of figural proportion that makes for coherent unity in a decoration. The tendency to linear elaboration of draperies continued to develop from earlier centuries, culminating in the elaborate wind-blown style of the end of the 12th century, best seen in the churches of Nerezi in Macedonia, at Lagoudhera in Cyprus, and in fragmentary decorations elsewhere in Greece, Russia, and Turkey.

The Latin conquest of Constantinople in 1204 marks a century of uncertainty in the field of religious painting with an assumption on the part of some scholars that painting of the Byzantine style in this period is all by western artists. However that may be, it can be seen that surviving Byzantine painting from the late 13th and 14th centuries exhibits important changes. The most salient of these is the tendency towards narrative in the scenes rather than the monumental iconic approach. This may be compared with narrative in ancient Greek sculpture where a single scene may illustrate events that are separate in time, place, and action but which are related to the central character or happening. A good Byzantine example is the scene of the Nativity of Christ where the Mother of God and newly born child in the manger are surrounded by subsidiary events depicting the journeying Magi, the annunciation to the shepherds, and the washing of the child by midwives. Another change in church decoration is the striking tendency to give figures greater bulk and weightiness so that they sometimes assume a sculptural quality. Painting of this period is best seen in Macedonia, Greece, and the Balkans, and in Constantinople.

There is a final flourish of late Byzantine painting of which good examples survive at Mistra in the Peloponnese and in Serbia. The narrative element became further developed in this late period and the weightiness of figures disappears in favour of an almost effeminate elegance and lightness that bears an affinity with the contemporary international Gothic style of western Europe. A variant of the late style in Russia moved in the opposite direction and developed the earlier Byzantine linear styles almost to a state of abstraction. Byzantine painting continued to thrive in the 16th and 17th centuries with vigorous schools of painting in Crete, Cyprus, Serbia, Dalmatia, and Russia. Its final impact in the West may be said to come in the works of El Greco, a Cretan by training.

In summary, Byzantine painting was born out of the pagan Classical world, and the continuity of Greek ideas can be seen in all the variations of the Byzantine style. Earlier scholarship tended to concentrate on finding Classical prototypes for features of Byzantine painting, but contemporary scholarship, while recognizing the influence of Classical work, stresses the

individual character of the Byzantine achievement, so that the idea of a renaissance of Classical art in Byzantium is now less prominent. The continuity is rather to be sought in the sense of orderliness, proportion, and harmony in figural work that underlies the work of ancient Greece and which is present in all good Byzantine painting.

Tourkokratia and Modern

The fall of Constantinople in 1453 marks only a nominal break in the history of Greek painting, which continued to be predominantly ecclesiastical in function (wall paintings and icons) and Byzantine in stylistic character. But the scale of activity and its organization were considerably modified since, with the Orthodox community now poorer and oppressed, fewer and smaller churches were built, and painters were no longer located in major urban centres. The important monastic communities (e.g. Mount Athos, Meteora), however, retained their status and influence. The most important early school was in Crete, with another, less clearly defined, in Macedonia (perhaps in the region of Kastoria). (In the discussion that follows, representative works of the artists mentioned appear in brackets following the artist's name.)

But even at this early stage the seeds of stylistic change were being sown in those parts of Greece (Crete, the Ionian islands, and the Dodecanese) that were at the same time free from Ottoman control and in contact with western Europe (especially Venice). There Renaissance forms and subjects, foreign to the Byzantine tradition, influenced the development of painting. With the appearance of Cretan artists on the Greek mainland in the 16th century, such ideas spread more widely, and the trend was intensified when further emigration followed the fall of Crete in 1699. During the final phase (1700–1830) of post-Byzantine art (the term is used to refer to the period between the fall of Constantinople and the establishment of Greek independence) there was much activity in the field of church painting. This included both lively innovation and a determined adherence to tradition.

For some, at least, of the period so far discussed decorative painting plays an important role. Such work is found in the buildings of Rhodes during the rule of the Knights of St John (1309–1522). On the mainland most examples belong to the houses of wealthy merchants and are not earlier than the mid-18th century. But from then on they are plentiful.

At that time external contacts were increasing with the weakening of Ottoman control; artefacts in western taste were widely accessible; and western Europeans were increasingly interested in Greek culture and in visiting its country of origin. The ever-strengthening current of western influence – in the status of artists and the type of work demanded, as well as in style – was particularly evident in the Ionian islands. Thus, if the beginning of "modern" Greek painting is defined without strict reference to chronology but as the point when artists started seriously to move away from the conventions of Byzantine and folk art in favour of those of western painting, the late 18th and early 19th century hold the key.

With the installation of a Bavarian monarch (Otho, 1833) as king of Greece, the destination of the first Greek artists to study abroad was assured. Thus the Akademie der Bildenden Künste in Munich, with its tradition of academic realism, was the most influential institution in the formation of the artistic ideas of the first post-independence generation of "modern" painters. Formal teaching of painting in Greece was established around 1840 with the institution that was later (1863) to become the Polytechnic. To begin with, the teaching establishment was mainly foreign. From the turn of the century, however, artists studied in other countries (Austria, Denmark, France, Italy) as well. Thus new currents entered the world of Greek painting. Most significant was that of Impressionism, through Greek artists based in Paris. The consequent move away from strict realism of representation was a crucial one in the history of Greek painting. Subsequently, all the major developments in 20th-century western European art have been accessible to Greek painters and absorbed by them in varying degrees.

Sources and influences

The influences of the Renaissance from which Greece was largely isolated are most evident in Crete, the Ionian islands, and Rhodes, none of them initially under Ottoman control. The work of Michael Damaskinos (*c.*1535–92/93, *The Adoration of the Magi*, Hagia Aikaterini Sinaitiki, Herakleion), a member of the Cretan school who specialized in icons, shows a perceptibly increasing concern with the softer features and tones and less austere feeling of Italian painting as well as the use of some Italian subjects and motifs. Damaskinos, like other Cretan painters, worked in Venice for several years and would have executed commissions regularly for Catholic patrons. In the Ionian islands painters such as Panagiotis Doxaras (1662–1729, *The Holy Family*, Koutlidis Collection) and, later, Nikolaos Koutouzis (1741–1813, *Portrait of a Nobleman*, National Gallery, Athens) adopted a thoroughly western style for both religious and secular subjects. Particularly striking evidence of western influence is provided by a non-ecclesiastical aspect of their work – portraits; indeed the very development of portraiture demonstrates a new role for painting and a new social milieu.

In spite of the increasing infiltration of western forms, the prevailing climate remained (and has continued to be) overwhelmingly Byzantine. In the remote Agrafa region of northwestern Greece, Dionysios of Phourna (*c.*1670–after 1744), in his *Painter's Manual*, prescribed strict adherence to a traditional Byzantine approach in both subject and style. Among those who followed his precepts was George Markou of Argos (1719–46) who decorated several churches in Attica including Moni Petraki in Athens. A more informal approach displayed in the work of some Epirot painters (e.g. Panagiotis of Ioannina) stems from their background as artisans decorating house interiors in a "folk" style. More recent church decoration, not infrequently undertaken by major artists (Engonopoulos, Kontoglou, Kopsidis, Parthenis), usually has a strong and explicit undercurrent of tradition.

Apart from Frankish Rhodes, which is a special case because of its direct links with the crusader Knights of St John, the interior decoration of houses (*arkhontika*) and public buildings developed particularly in central or northern Greece and in areas with a prosperous merchant class (the shipowners of Pelion, the fur traders of Siatista). Greek traders carried on much of the commerce of the Ottoman empire. The painting was done by artisans, members of travelling bands of builders and craftsmen. The small village of Chioniades, near Konitsa in Epirus, was especially known for its painters. The style of such work is simple and direct, sometimes crude: the motifs are often largely decorative, but land- and seascapes – including actual places (a view of Chalcis in Euboea, 1832, by I. Pagonis is in the K. Makris collection in Volos) – are common, and there are occasional portraits. Decorative and ecclesiastical painting were often closely related and the interchange of motifs and style is evident. I. Pagonis, who came from Chioniades, worked extensively in the Pelion area between 1800 and 1838, and later lived there, decorating both houses and churches (such as Agia Marina in Kissos, Pelion, 1802). Foreign influences include elements derived from European rococo and baroque. The illustrations (1837–39, now in the National Historical Museum and the Gennadeion Library, Athens) for General Makriyannis's *Memoirs* of the 1821 uprising by Panagiotis Zographos also fall into this category. Theophilos Chatzimichail (1873–1934), Greece's best-known "primitive", painted both panels and murals in an expansion of this tradition (*Limnios Kekhagias*, 1930, Theophilos Museum, Mytilini).

A "western" style of interior decoration, though copying ancient prototypes, can be seen in the paintings of Heinrich Schliemann's house, the Iliou Melathron in Athens (1879; following ancient "Pompeian" styles), or the original Athens University building (1839–49; king Otho in the company of personifications of noble qualities, ancient Greeks, etc.).

Mainstream secular painting

Although the hold of Byzantine art had been weakened through the influences of the West and of folk painters, it was only with the arrival of king Otho and his retinue in Greece that direct European contacts were possible for Greek artists as a whole and that mainstream, non-ecclesiastical painting became firmly established. In this context the influence of the Munich Academy (see above), where an academic approach with careful attention to accurate representation and an interest in genre subjects (cf. Nikephoros Lytras's *Return from the Panygyri of Pendeli*, Koutlidis Collection) were the dominant characteristics, was fundamental. Important Greek painters who studied there included Theodoros Vryzakis (1819–78), Nikephoros Lytras (1832–1904), Nikolaos Gyzis (1842–1901), and Georgios Iakovidis (1852–1932). Gyzis was subsequently a professor at Munich, and highly influential on Greek students, while Lytras and Iakovidis both taught at the Athens School of Fine Arts, thus encouraging the spread of the ideas of the Munich school from within Greece itself. The only indication of the Greek origins of these painters is (sometimes) the choice of subject – e.g. the historical events and portraits of Vryzakis (*Lord Byron at Missolonghi*, 1862, National Gallery of Athens) and the seascapes of Konstandinos Volonakis (1837–1907, *To limani tou Peiraia*, Piraeus Municipal Collection).

Increasing contacts with other centres – of which Paris was by far the most significant – radically changed the direction of Greek painting, away from academic realism and towards Impressionism. Here the important figures were Konstandinos Parthenis (1878–1967, *To limani tis Kalamatas*, 1911, National Gallery, Athens) and Konstandinos Maleas (1879–1928, *Topio Delfon*, National Gallery, Athens). Although European ideas were generally slow to be accepted in Greece, other subsequent 20th-century developments are all represented to varying degrees (e.g. the expressionism of Georgios Bouzianis (1885–1959) in paintings such as *Nude*, National Gallery, Athens).

The Greekness of Greek painting

This question became a central issue – indeed an aim – in the work of the so-called Generation of the '30s, a diverse group that included such artists as Iannis Moralis (1916–), Nikos Hadjikyriakos, known as Ghika (1906–94), and Ioannis Tsarouchis (1910–89), and can be examined most constructively in the context of their paintings.

As Lydakis has rightly pointed out, the definition of "nationality" in the painting of any country is a highly complex issue, although one that is often treated very superfi-

cially (to identify nationality on the grounds merely of subjects chosen, for instance, would be absurd). Major trends (Impressionism, abstraction) are international and the work of individual artists varies enormously in the extent to which it shows or does not show, universal, local, or individual features. "Nationality" can be defined only on the basis of a somewhat intangible blend of local atmosphere (including subject, treatment of light, topography, etc.), elements of style or subject derived from local tradition (whether continuous or retrospective), and attitude.

The role of tradition is crucial. Unsurprisingly, because of the unbroken continuity of icon painting and church decoration and the crucial role of the Orthodox Church in Greek national life, Byzantine subjects and style have exercised important influences on secular painting. In recent times this can be seen most clearly in the work of Photis Kontoglou (1898–1965, *Maria Kontoglou*, 1928, private collection; also paintings of Greek mythological and historical subjects in the Athens Dhimarkhion) and his pupils, including Rallis Kopsidis (1929–). It is interesting to note that Nikos Engonopoulos (1910–86), for all the surrealism of much of his work, also painted churches, including part of the Orthodox church of Hagios Spiridon in New York. Earlier Parthenis too had brought his distinctive style to bear on church painting (such as his panels for Agios Alexandros at Palaio Phaliro, Athens). The intermingling of folk and Byzantine styles, noted earlier in the context of post-Byzantine Epirot painters, is evident still in the work of Kopsidis in the monastery at Pendeli (scene of the *God-Protected Mountain of Pendeli*).

That folk art was still flourishing in the earlier 20th century is evident in the work of Theophilos Chatzimichail, who painted both murals and, less common in this tradition, panels, but its influences are evident also in the work of other artists. The most interesting case is that of Ioannis Tsarouchis, some of whose figures and decorative elements are clearly in this vein (*Sailor*, 1950, private collection, and *Protomayia*, 1965, National Bank of Greece). The artist expressed great admiration for Theophilos. In Tsarouchis's work are fused a range of elements including, apart from folk features, occasional references to Byzantium (he was for a time a pupil of Kontoglou), the Classical past (*Piraeus in Antiquity*, 1965), and Greek topography.

The use of ancient motifs and compositional forms, as found for instance in the grave monuments of Moralis (*Memorial Composition*, 1958, artist's collection), shows how such elements can be incorporated into work that is Classical in a much broader sense than of a simple reference to antiquity. Often, however, the use of ancient or archaeological motifs is retrospective rather than traditional since, with the exception of occasional features such as the Late Antique Fayum portraits which are clear antecedents to the Byzantine style, there is no continuity of use from antiquity.

Other more superficial but recurrent elements, which are local in the sense of reflecting the preoccupations of a sea-orientated people and traditional in that they occur sporadically in paintings of all periods, include a strong interest in ships and the sea. This is sometimes tied to naval battles of the War of Independence (Volonakis's *The Disembarkation of Karaiskakis at Phaleron*, National Bank of Greece), sometimes to ships themselves. Noteworthy also is a curiosity (Maleas's *Santorini*, National Gallery, Athens) about the effects of light, shade, and colour, thrown into prominence by the vibrant Aegean atmosphere and encouraged by the influences of Impressionism. Artists have also been attracted to modern genre themes that represent endemic features of the Greek social scene such as family life, kafeneia (Tsarouchis's *To Kafeneion*, 1955, Methenitis Collection), etc.

Since the abstract movement of the 1950s and 1960s such tendencies have been less evident, in the context of a stronger internationalism and a greater concern with art theory. Nevertheless ancient and Byzantine art continues to inspire and provide subject matter for Greek artists (such as D. Mytaras's *Ap' to Ergastiri*, 1989), as do the unique landscape and atmosphere of Greece itself (as seen in K. Papatriandaphyllopoulos's *Coast of Attica*, 1988, Philaniotou Collection).

Paisy Velichkovsky, St 1722–1794

Athonite monk

The Ukrainian St Paisy Velichkovsky was in the Greek-speaking world for only 17 years. He was on Mount Athos from 1746. He had been tonsured *rasophor* (novice) in the Pecherskaya Lavra of Kiev whence he came via the Danubian principalities of Moldavia and Wallachia. When he arrived on the Holy Mountain he walked northwards from the Great

Lavra. The exertions of journey on foot and the heat of the day caused him to fall seriously ill. He was cured by monks in the Pantokratoros skete, near which he then settled as a hermit, having searched in vain for a spiritual father. In 1750 he was visited by his former mentor, the Elder Vasily, who tonsured him with the small *schema* (habit) and after a while returned to Wallachia. Three months after Vasily's departure St Paisy was joined by another Wallachian, Monk Vissarion, who begged to be his disciple. St Paisy refused and they lived for some time sharing everything and submitting in spiritual obedience to each other. The two monks were soon joined by others from the Danubian principalities and Ukraine. Eventually St Paisy reluctantly agreed to be their spiritual leader. The brotherhood had to move into the larger cell of Sts Constantine and Helen, belonging to the Pantokratoros monastery. When he had 12 disciples, in 1757, St Paisy was granted a charter from Pantokratoros, to make another of its dependencies, the Prophet Elijah cell, into the Prophet Elijah skete. In under five years he was in charge of a brotherhood 60-strong. He had originally planned for a community of no more than 16 monks, but he was unable to turn people away. Eventually he was asked by the Holy Community to move to the debt-ridden monastery of Simonopetra, on the other side of the peninsula. He arrived there with 35 brethren on 15 April 1762. Unfortunately, Turkish creditors were clamouring for the 50,000 lei owing to them; and St Paisy, unable to cope with the debts, left the Holy Mountain the next year for Moldavia, whence he never returned.

This terse account of his all too brief sojourn on Athos gives little indication of the important role he played in Greek spiritual life and of his influence on subsequent Athonite history. The Prophet Elijah skete became the centre for Russians on Athos at the time, for the so-called "Russikon", or Russian monastery of St Panteleimon, was probably inhabited only by Greeks and southern Slavs in the latter half of the 18th century. The Russians whom the Greeks invited back to St Panteleimon in 1839, and whose successors took over the monastery, originated from the skete. Until 1992, when the last of its brethren representing the Russians were expelled, the skete was the oldest Russian Athonite house in modern times to be continuously in Russian hands.

During his 17-year stay St Paisy's renown spread all over the Holy Mountain. He had spiritual children of many nationalities, and was even confessor to Patriarch Seraphim I, who was living in retirement in Pantokratoros monastery. Word about St Paisy spread to other countries, particularly to the Danubian principalities, Ukraine, and Russia.

St Paisy's ability to attract pilgrims from abroad is remarkable because in the mid-18th century the Orthodox Church was undergoing a crisis. The Athonite community was having to cope with the increased *harach* (tax). Some monasteries, such as Simonopetra and St Panteleimon, were becoming depopulated and bankrupt; others were reverting to idiorrhythm and being abandoned by their senior monks, who were absent on alms-gathering missions. In post-Petrine Russia, which had tenuous links with the Holy Mountain, monasticism was hardly thriving. Perhaps the Orthodox world was yearning for such a luminary as St Paisy.

His personal qualities transcended ethnic barriers. Few Slavs had such good relations with Greek Athonites. The year after he left, the Greeks were extremely well disposed to the Russians because of him: the Holy Community offered to pay the *harach* that had been imposed on the skete by the civil authorities and apologized to the skete for the inconvenience that might have been caused. In the 1798 charter Pantokratoros granted the Prophet Elijah skete "substantial rights and privileges" in recognition for the "considerable benefit and help" received by the monastery from its "blessed and most venerable founder and father the Elder Paisios"; yet, somewhat less than a century later the monastery and its skete were embroiled in bitter quarrels and most of these privileges were taken away.

Paisy himself knew that facilitating harmonious international relations was a gift others did not have. When in later years he gave the Rule to Abbot George of Cherniça he told him to accept only Romanians into the brotherhood in order to avoid misunderstandings and conflicts. As the leader of a multinational community St Paisy was perforce a consummate linguist: Article 15 of the Rule he drew up in 1763 for the Dragomira monastery stipulated that "since our community is composed of three nationalities, then three languages, Greek, Slavonic, and Moldavian" must be known by the abbot. He learnt Moldavian before he came to Athos, when he and many other Small Russian monks were on the move between eastern Ukraine and the principalities in search of places where they could lead an eremitic existence under the guidance of spiritual fathers and without interference from the world outside. Acquiring Greek, however, required saintly dedication. In the tradition of the Elder Vasily and his other mentors, St Paisy sought out patristic texts and copied them, usually at night.

In his first years on the Holy Mountain he searched everywhere for these texts, but nobody knew of their whereabouts. Greek Athonites were so ignorant that they were not only incapable of reading them but many had never heard of them. He eventually found some of the texts he was looking for in a remote cell, copied them, translated them, used them as his spiritual guide, and taught from them. He was thus one of the first revivers of hesychasm on Athos and once again spread the teaching of Sts Gregory Palamas, Symeon the New Theologian, and Gregory of Sinai. There is evidence that St Paisy was a supporter of the Kollyvades, who sought to uphold an exact observance of the holy canons and the liturgical rules, and whose primary concern was to safeguard Orthodox faith and life in its total integrity. A little over a decade after St Paisy left Athos, the general Greek Orthodox revival of patristic traditions was further promoted on the Holy Mountain by Sts Nikodemos the Hagiorite and Makarios of Corinth, who published the *Philokalia*.

Although St Paisy began his Athonite life as a hermit, he was most influential as a leader of the cenobitic community. The admired harmony of his self-sufficient yet poor skete, the first on Athos to be a cenobium, counterbalanced the new trend of lax idiorrhythmic freedom, which seemed to be gaining the upper hand. St Paisy, the publishers of the *Philokalia*, and others, such as St Kosmas the Aetolian, were influential at the same time that feelings of revolutionary independence were stirring in all Greeks. Turkish oppression seemed at its worst; but just as in the Peloponnese, Church schools were opening and the Athoniada was founded. It is

remarkable that St Paisy, a Slav, should be associated in this way with the resurgence of the Greek national Church.

Biography

Born in the Ukraine in 1722, Paisy studied at the theological academy in Kiev and was tonsured as a monk there before moving to the Danubian principalities. In 1746 he arrived on Mount Athos and settled as a hermit. In 1757 he was put in charge of the Prophet Elijah skete where by 1762 the brotherhood had grown to 60. He promoted hesychasm and translated the *Philokalia* into Slavonic. In 1763 he left Athos and founded a monastery in Romania where he died in 1794.

Palaiologos family

Byzantine imperial dynasty (1259–1453)

The earliest antecedents of the Palaiologoi are unknown but the family had emerged as an important member of the new landholding elite by the second half of the 11th century and was soon interconnected by marriage with other such families, in standard "aristocratic" practice. The first identified scion of the family was Nikephoros Palaiologos, a commander under the emperor Michael VII Doukas (1071–78). His son, George, was a loyal lieutenant of Alexios I Komnenos (1081–1118). Several members of the family served as generals and regional governors through the 12th century, and one of them, Alexios Palaiologos, rose to prominence at court on the eve of the Fourth Crusade by marrying Irene, daughter of emperor Alexios III (1195–1203). Their daughter, Theodora, married a cousin, Andronikos Palaiologos, who served as Grand Domestic (*Megas Domestikos*), or army chief, in the Byzantine government-in-exile of the Laskaris dynasty in Nicaea.

Their son, related by blood to three earlier families of emperors, was Michael Palaiologos, who followed his father in important military commands. Michael's restless personality and selfish machinations repeatedly won him the suspicion of the emperors John III Vatatzes (1222–54) and Theodore II Laskaris (1254–58). Exploiting the unstable regency for Theodore's young son, Michael boldly usurped the throne (1259). Defeat of rival forces at Pelagonia (summer–autumn 1259) and then the recovery of Constantinople itself (July 1261) gave him prestige as the restorer of rightful Byzantine sovereignty. But his ambitious programme of imperial recovery strained his realm's resources, while his abortive engineering of Church union with Rome for diplomatic purposes caused great dissension and hatred among his subjects.

His son and successor, Andronikos II (1282–1328), if well intentioned and good-hearted, was unequal to the task of adjusting the restored Byzantine empire to its reduced realities. A struggle for the throne between him and his grandson, Andronikos III (1321/28–1341), initiated the internal strife and dynastic conflict that repeatedly plagued the dynasty. Any hope for revival was further dispelled by renewed strife when, during the tumultuous minority of the legitimate successor, John V Palaiologos (1341/55–1391), the throne was contested by John VI Kantakouzenos (1341/47–1354). The latter's talents proved futile in the face of Serbian and Ottoman Turkish challenges; the achievement of sole rule by John V then brought to power a mediocre and hapless leader who presided in futility over the humiliating reduction of his dwindling realm to Turkish vassalage.

John V's son, Andronikos IV (1376–79), and then his grandson, John VII (1390), made shortlived efforts to seize the throne from him. Another of his sons, his legitimate successor Manuel II (1391–1425), was a man whose great abilities were wasted by the hopelessness of his situation, but who steered his wasted realm as well as he could between accommodation and hostility to the Turks. His eldest son and successor, John VIII (1421/25–1448), attempted to do the same, but his too-zealous commitment to Church union brought dissension without any reward of western aid. John's younger brother, Constantine XI (1449–53), was left to bear the ultimate burden, dying on the walls of Constantinople when the Turks stormed the city in May 1453 and ended the Byzantine empire.

Over the generations, diplomatic marriages gave the Palaiologoi a wide range of foreign connections, supplying them with Bulgarian, Russian, Serbian, Hungarian, Italian, Franco-Greek, Franco-Cypriot, diversely Levantine, Armenian, Trapezuntine, and even Turkish spouses. (By the same token, as with so many dynasties, such wide matrimonial mixing meant that the Palaiologoi could be considered a "Greek" family rather more in cultural than in strictly ethnic terms.) One case of such involvement was the north Italian house of Montferrat, with which Byzantium had long had a love-hate relationship. Theodore Palaiologos, a younger son of Andronikos II and his Latin wife Yolande-Eirene of Montferrat, was established in 1306 as marquis of Montferrat, and his descendants survived as an Italian dynasty until 1533, in the meanwhile producing a princess, Sophia, who was briefly (and unhappily) married to John VIII Palaiologos.

An important branch of the Palaiologan family became identified with the flourishing appanage of the Morea in the Byzantine Peloponnese. Following a younger son of John V, Theodore I (1388–1404), Manuel II's second son Theodore II (1407–43) ruled it in association with and then followed by his younger brother Constantine (1428/43–1448). It was also shared with Manuel's fifth and sixth sons, Demetrios (1449–60) and Thomas (1430–60).

This Moreot branch of the Palaiologan family was to play a curious role in the post-Byzantine Hellenic tradition. Following the Turkish capture of Constantinople (1453) and the final conquest of the Morea (1460), Demetrios surrendered to the sultan to become a Turkish dependant, dying in 1470, while Thomas fled to Italy where he became a pensioner of the pope and a diplomatic pawn, dying in 1463. Of Thomas's children, one daughter, Helena, married a Serbian prince, while the other, Zoe/Sophia, made a famous marriage (1472) to Ivan III of Moscow, becoming the mother of Vasili III and the grandmother of tsar Ivan IV "the Terrible", and helping to feed the Muscovite image of the "Third Rome". Of Thomas's two sons, the elder, Andreas, eked out a wretched existence at the papal and other courts, merchandising his titles and dying miserably and childless in 1502; while the younger, Manuel, fled to Constantinople in 1476 and became a Turkish subject, fathering two known sons.

At this point, the securely documented principal line of the Palaiologoi ends. But a vast number of genealogical claims have been made, asserting descent mostly from the sons of Manuel II (primarily Thomas and Demetrios but also the third son, the short-lived Andronikos), though some putatively linked to various earlier branches on the family tree. None of these claims can be proved conclusively, but their persistence – down into the international ex-nobility circles of our own time – is tenacious. There have been lively claimant branches in Romania, Malta, France, and England.

England, indeed, was most productive of would-be Palaiologoi. A curious claimant flourished until as late as 1988 on the Isle of Wight. On the other hand, we know something of a "Theodoro Palaeologos of Pesaro in Italye", who claimed descent from a supposed John, a putative son of Despot Thomas of the Morea. Born around 1560, Theodoro was a professional assassin and adventurer who, exiled from Italy, settled in England, saw military service in the Netherlands, and died in 1636: his tomb may still be found in the parish church of Landulph in Cornwall. Of his three known sons, one, Theodore, was born in 1611 and died in 1644 fighting in the English Civil War on the Parliamentary side, which won him a grave in Westminster Abbey still to be seen. The eldest, John, born in 1609, fought at the battle of Naseby in 1645 and subsequently settled on Barbados in the West Indies. There he joined his younger brother, "Ferdinando Paleologus", who, born around 1615, had left England before the Civil War to become one of the early colonists of the island; Ferdinando died there in 1678 and his grave is still visible, with a marker added in 1906.

Though most of the numerous pretensions to Palaiologan ancestry are dubious at best and clearly bogus at worst, it is not impossible that a few have merit, or derive from distant relatives or retainers of the family who conventionally adopted its name; but there is no secure way that any can be proved. Nevertheless, the idea that descendants of the last family of Byzantine emperors survived in the West persisted over the centuries, even among the Greeks themselves. When they had won independence in the 1820s, the early leaders of the newly created nation of Greece sent a delegation to western Europe to locate any verifiable Palaiologoi. They returned without success in their quest, but it is a tribute to this family's historical reputation that Greeks, at that early stage of defining their Hellenic identity for the modern world, should still have thought of connecting themselves with the prestige of the Byzantine imperial tradition through a hoped-for dynastic survivor.

Palamas, Kostis 1859–1943

Poet, critic, journalist, novelist, and dramatist

Palamas is the top-ranking representative of the so-called *Genia tou '80* (Generation of the Eighties) which gave new spirit to modern Greek literature after the period of Romanticism. The work of Palamas as poet and critic covers a span of more than half a century and represents a milestone in the history of letters of Greece by establishing a whole new set of literary values which find their expression in the *Nea Athinaiki Scholi* (New School of Athens) whose founder and foremost champion Palamas was.

After losing his parents at the age of eight he came into the custody of his uncle at Missolonghi and it was there that he spent his schooldays and part of his youth. In 1875 he began studies in law in Athens, but before long he broke them off and decided to devote himself to poetry and literature. Early literary endeavours were published in 1875 in the *Attikon Imerologion* (Attic Journal) of Irenaios Asopios, and a collection of poems titled *Eroton Epi* (Words of Love) was submitted in 1876 to the writers' Voutsinaios competition. Both works show the influence of Romanticism and are written in katharevousa.

The change occurred in 1886, the year of publication of a collection of poems by Palamas called *Tragoudia tis Patridos mou* (Songs of my Homeland). The poet had meanwhile fully adopted the message of Demoticism and by and by he would become one of the leading figures in the battle for its prevalence. The poems are the very incarnation of the values which the *Genia tou '80* had in mind: themes are taken from folk songs, popular traditions, and the history of the Greek nation, the linguistic instrument being Demotic. Quite evident is the influence of the *Eptanisiaki Scholi* (Ionian school), especially that of Dionysios Solomos, but also of Nikolaos Politis, the great champion of folklore research and founder of the new academic field of studies in modern Greek folklore. The folklore element quite often served as a basis in the works of Palamas, especially in the novel *Thanatos Pallikariou (*A Young Man's Death) (1897) and the play *Trisevgeni* (Thrice Noble) (1903). In 1889 he published *O Ymnos tis Athinas* (Hymn to Athena), a long poem which three years later won a prize at the writers' *Philadelphios* contest at the enthusiastic proposal of Nikolaos Politis.

Full recognition as a poet came in 1892 with the publication of a new collection of poems called *Ta Matia tis Psychis mou* (The Eyes of my Soul), the title being a line from a poem by Solomos. Linguistically the author is here strongly influenced by the views of Yannis Psycharis (the champion of Demoticism whose *To Taxidi mou* (My Journey) had been published in 1888), holding them in such high esteem as to focus in his prologue almost exclusively on the issue of national language. The collection was also awarded a prize at the writers' *Philadelphios* contest at the suggestion of Aristotelis Provellengios. A year later Georgios Kalosgouros emphasized that the value of the poems lay in their Greek character, the author's orientation to the West, and his acknowledgement and acceptance of Solomos's legacy.

In 1895 Palamas accepted the challenge of writing the hymn for the first Olympic Games in modern times, a commission that confirmed his full recognition by the Greek learned upper classes.

In 1897 he was appointed secretary to the University of Athens (later he became secretary-general) and in the same year he published the collection of poems *Iamvi ke Anapesti* (Iambs and Anapaests), part of which was set to music by Manolis Kalomiris. Next followed the collections *Taphos* (The Grave) (1898), poems on the death of his four-year-old son Alkis, *I Chairetismi tis Iliogennitis* (Greetings to the Sunborn) (1900), and *I Asalevti Zoi* (Still Life) (1904) which contained the poems "Phinikia" (The Palm Tree) and "Askreos", both much discussed because of their content, as well as the famous "I Trilogia tou Thymou" (The Trilogy of Anger), a violent attack on the rigid attitude of the conservative circles of his time regarding matters of language. The first version of his trilogy was written in 1901 on account of the so-called *Evangelika*, dramatic events which had been caused by the translation of the New Testament into demotic by Alexander Pallis; it was revised in 1904 because of the *Orestiaka*, new wild demonstations directed against the translation of Aeschylus' *Oresteia* into a simplified katharevousa by Georgios Sotiriadis. Palamas, who had been a supporter of both these "revolutionary" events, consequently had to withstand the fierce attacks of the disciples of purism, thereby even losing his position as secretary-general to the university for 11 months.

Almost at the same time he worked on his two great epic poems, *O Dodekalogos tou Giphtou* (The Twelve Words of the Gypsy, 1907) and *I Phlogera tou Vasilia* (The King's Flute, 1910). Both works arise from the national humiliation brought about by the disastrous Graeco-Turkish war of 1897, each one expressing in its own way the yearning but also the hope for recovery. There is also a thematic blending of Classical, Byzantine, and modern history while, as for language, the wealth of the Byzantine vocabulary is apparent. In this connection it is interesting to note that in the field of historiography the first attempt to show the continuum in the sequence of antiquity–Byzantium–modern Greece was made in 1853 by Konstantinos Paparrigopoulos in his book *Istoria tou Ellinikou Ethnous apo ton Archaiotaton Chronon mechri Simeron* (The History of the Greek Nation from Antiquity to Today).

In *O Dodekalogos tou Giphtou* the poet identifies with the wandering hero who tries in vain to put down roots somewhere for good. The restless figure of the protagonist and the many adventures and sufferings he has to undergo reflect the state of the Greek nation. *I Phlogera tou Vasilia* on the other hand is centred on the Macedonian fight against the Bulgars, which is why the poet narrates the heroic deeds of the Byzantine emperor in such detail. Central to both works is the idea of the inner cohesion, the uninterrupted continuity, and the evolutionary progress of Hellenism in space and time, as well as the adoption of European values.

Palamas's lyrics comprise the following collections of poems: *I Kaimi tis Limnothalassas* (The Sorrows of the

Lagoon) (1912), *I Politia ke i Monaxia* (City and Loneliness) (1912), *Vomi* (Altars) (1915), *Ta Parakaira* (At the Wrong Time) (1919), *I Pentasyllavi* (Pentasyllabes) (1925), *I Lyki* (The Wolves) (1925), *Ta Pathitika Kryphomilimata* (Sentimental Whisperings) (1925), *Dyo Louloudia apo ta Xena* (Two Flowers from Abroad) (1925), *Dili ke Skliri Stichi* (Harsh and Timid Verses) (1928), *O Kyklos ton Tetrastichon* (The Cycle of the Tetrastichs) (1929), *Perasmata ke Chairetismi* (Passages and Greetings) (1929), *I Nychtes tou Phimiou* (The Nights of Phemios) (1931). As for his writing in prose, much of it is still unpublished and is preserved in the Palamas Archive in Athens.

Equal in importance to his lyrical work are the critical writings of Palamas: *Grammata* I (Letters) (1904), *Pezi Dromi* I, II (Prose Ways) (1928), III (1934), *I Poiitiki mou* (The Art of my Poetry) (1934), etc., in which he expresses his views on poetry and on literature in general and examines their relationship to society. These views were subject to change during his long career as an author but only with regard to aesthetic judgement, the stressing of certain aspects of the poet and his work, or the use of specific tools of criticism; the general pattern for evaluating the manifestations of Greek or world literature remained unchanged. In his view, literature expressed the national soul which is made up of the popular living language of the day (demotic and not katharevousa). Since the national soul finds its expression in the works of the Ionian school, especially in those of Solomos, all productions and writers of the modern Greek literary scene were evaluated in comparison to them. Palamas regarded Solomos as the poet who expressed best the national soul because his works are the very incarnation of the three nation-forming ideas, namely the idea of Beauty, the idea of Fatherland, and the idea of Language (*Idea tou Oraiou, Idea tis Patridos, Idea tis Glossis)*. His critique of Solomos's work, written in 1901, is still regarded as a significant and substantial study of the subject.

The influence of Palamas's work on both the writers of his day and those that followed is evident. A number of minor poets (Konstantinos Manos, Miltiadis Malakassis, Lampros Porphiras, Ioannis Gryparis etc.) are to be found in his shadow and the upgrading of his work by later leading figures in the literary scene (George Seferis, Odysseus Elytis, Yiannis Ritsos) serves only to confirm the magnitude of the poet's lasting presence.

A large part of the lyrical and critical work of Palamas was edited by Georgios Katsimbalis and Konstantinos Kasinis. The latter completed his predecessor's research and in cooperation with the Foundation Kostis Palamas published his work in 16 volumes, together with a corresponding index. Also in collaboration with the Foundation the fourth volume of the correspondence was published in 1994.

ALEXANDRA-KYRIAKI WASSILIOU

Biography

Born in Patras in 1859, Palamas was brought up by his uncle in Missolonghi. In 1875 he began studying law in Athens but gave it up to devote himself to writing. He is the foremost representative of the so-called "Generation of the Eighties" which gave new spirit to modern Greek literature after the period of Romanticism. He was founder and champion of the "New School of Athens" and one of the leading figures in the battle for the prevalence of the demotic form of the language. He died in Athens in 1943.

Palestine

The name Palestine is derived from the Peleset (the biblical Philistines), a people settled on the coast of Palestine in the 12th century BC by the Egyptians to look after their interests; attempts to link them with the Mycenaean Greeks are highly speculative, though there are cultural similarities. There were contacts with Greece from the earliest period, but they were not especially significant, though the southern range of the cities of the Phoenicians, who had a decisive influence on the development of Greek culture from the 10th to the 7th centuries BC, overlaps into Palestine.

Palestine really enters Greek history with the conquest of the Persian empire by Alexander the Great of Macedon, who took it over on his way to Egypt in 332 BC. With the division of Alexander's empire on his death, Palestine was initially controlled by the Ptolemies of Egypt, and the attractions of Greek culture made themselves felt almost at once. In particular, Ptolemy recruited a large number Palestinian Jews to populate the new city of Alexandria. This new Jewish community became exclusively Greek-speaking (and was responsible for the translation of the books of the Old Testament into Greek – the Septuagint – with momentous consequences both for

Christianity and for the development of the Greek language), and its continuing contact with the Jews of Palestine was one of the means by which the international Hellenistic culture made its influence felt in Palestine. Thereafter, though the local Semitic language, Aramaic, continued to be the first language of most people in the region, knowledge of Greek spread very widely, and it seems likely that many people would have had at least some knowledge of the language. By 198 BC the Ptolemies had been driven out by the Seleucids, and subsequently one section of the population of Palestine, the Jews, reacted strongly against the spread of Hellenization (the issues are obscure, but seem to be related to the introduction of Greek institutions, such as athletics, into Jerusalem); the outcome was a rebellion which, thanks to the Seleucids' problems with the Parthians and the Romans, ultimately led to the setting up of a Jewish state under the Hasmonean dynasty. Though the ideology of the new state was "anti-Greek", the attractive influence of Hellenism continued to exert itself. The kings, for example, took Greek names (Aristoboulos, Alexander), and while the non-Jewish cities of Palestine were trying to establish ancient links with Greek culture (Joppa, for example, claimed to be the place where Perseus saved Andromeda from the sea monster, and other non-Greek cities invented Greek founders), the Jews went one better and claimed that Sparta was a Jewish colony (1 Maccabees 12: 5–23). Later, when Herod became king under the protection of the Romans, the Temple he built in Jerusalem was essentially in a Hellenistic style. Herod, indeed, founded a new city on the coast, Caesarea, which was entirely Hellenistic in nature, and equipped with the standard institutions of the Greek lifestyle, including theatres, statues, and temples.

The reduction of Palestine to a Roman province, and the crushing of two Jewish revolts in the 1st and 2nd centuries AD, removed the Jews from effective control of the region, and thereafter the process of Hellenization followed the same pattern as elsewhere in the Roman empire. The growth of Christianity, however, gave Palestine a new significance in the Greek world. Herod's foundation, Caesarea, was a particularly influential centre for the development of Christian thought. The Alexandrian theologian Origen worked there in the 3rd century towards the end of his life, and founded a school that played a decisive role in the formation of the eastern tradition of theology. In the next century the Christian historian Eusebius was bishop there. Later, with the establishment of Christianity as the official religion of the empire, Palestine became the home of a monastic tradition that was one of the roots of Orthodox monasticism. The patronage of the emperors from Constantine onwards resulted in the construction of major shrines in places important in Christian tradition, especially the Church of the Holy Sepulchre in Jerusalem. As a result, a long tradition of "religious tourism" had by the 4th century developed into pilgrimages proper, travel to sacred sites in the hope of accumulating spiritual benefits. The special position of Jerusalem is shown by the decision of the Council of Nicaea (325) to raise its bishop to the status of patriarch, fifth in precedence after the bishops of the politically more significant sees of Rome, Constantinople, Alexandria, and Antioch. Though politically a backwater, Palestine continued to be spiritually significant throughout the Byzantine period, and after the Arab conquests Byzantine emperors regarded the protection of religious communities there as one of their special responsibilities.

Under the period of Ottoman rule, Palestine remained an important goal for Greek Orthodox pilgrims and was, like most parts of the Ottoman empire, the home of a substantial population of Greeks engaged in trade and commerce. Most important of all, however, was the guardianship of the Holy Places, always a matter of contention between Greeks and Latins, and regarded as a matter of crucial importance by the Orthodox Church. The Grand Dragoman Alexander Mavrokordatos (died 1709) used his political leverage with the Turkish sultan to secure the transfer of many of the Holy Places of Jerusalem from Latin to Greek control (working with Dositheos, the patriarch of Jerusalem); to his great credit he also made every effort to ensure that unfettered access was given to Christians of all denominations. With the decline and break-up of the Ottoman empire, and with it the Ottoman economic system, the Palestinian Greek community dwindled. By the middle of the 20th century there were perhaps only about 5000 Greeks living within the Jerusalem patriarchate. There is a substantially larger (though still small) Greek Orthodox congregation in Palestine (though it is under increasing pressure), but most of its members are Arabic-speaking. The patriarch, however, and the higher clergy are still Greek (a fact that has recently caused some tension). Greeks still run a number of the holy places (most importantly, large sections of the Church of the Holy Sepulchre), and there are several Greek churches and monasteries, particularly in Jerusalem. Devout Greeks still go on pilgrimage to the Holy Land.

Pallis, Alexandros 1851–1935

Scholar, poet, and translator

Known first as the "great demoticist", Pallis was an early advocate of the recognition of *dimotiki* or vernacular Greek as a viable language option for the modern Greek state. In the crucial decade of the 1890s he embraced and perpetuated the cause of demoticism and became "a perfect example of the chains of transmission so important in Greek literary life" (Bien, 1972).

Although spending most of his life away from Greece, in India and in England, Pallis remained closely associated with the language question in Greece. The complexity of the language problem itself – what was to be the official language

of Greece – is staggering and has always been an integral part of the Greek struggle for self-determination. At least since the 1880s, the question has centred on the debate between the demoticists, who argue for a "living language", a form of Greek that mirrors the everyday speech of the people, and the "purists", who argue for katharevousa, the more purified Greek of the educated classes.

Pallis supported the linguistic and cultural theories of the influential demoticists, Dimitrios Vernardakis and especially Yannis Psycharis, remarking: "My eyes were first opened by Vernardakis and practically by Psycharis. The internal need which required me to change was common sense." The publication of the first substantial literary work written in demotic, *My Journey* by Yannis Psycharis, was a singular event, which demonstrated to Pallis that scholarly works could be successfully written in vernacular Greek. Remaining loyal to the tradition of Psycharis, Pallis produced numerous translations including Shakespeare's *The Merchant of Venice*, Euripides' *Cyclops*, book 1 of Thucycides, and some of the writings of Kant. He produced critical editions of the *Antigone* by Sophocles and book 18 of the *Iliad*. Of special note is an original work, *Brousos* (*Journey*), published in 1923, a satirical indictment of the conservative traditions of modern Greek society and its failure to respond to the needs of a modern generation.

Pallis's most significant and controversial achievements were his translations, into lively demotic, of the New Testament gospels (1901) and the *Iliad* (1904). His decision to translate these works was carefully considered. The gospels, written in "Byzantine Greek", formed the basis of the Orthodox faith. The writings of Homer were also important in the Greek consciousness. Although few modern Greeks could read either the *Iliad* or the *Odyssey* in the original, these epics provided a link to the ancient civilization of Greece. The translation of these revered works into demotic constituted a revolutionary act. In 1901, when the Athenian newspaper *Akropolis* began the serialization of Pallis's translation of the gospels, riots broke out in Athens. The translation was vehemently attacked in all sectors and was considered "anti-religious, anti-national, full of vulgar words, degrading the true meaning of the Gospel". Pallis was labelled a "traitor", and "an evil little creature that ought to be excommunicated". Despite all the controversy, the translation was clearly ahead of its time.

Pallis dedicated his translation of the *Iliad* (1904) to Psycharis, demonstrating his continued loyalty to his mentor. The importance of this translation cannot be overestimated. When composing his own translation of the *Iliad*, the novelist Nikos Kazantzakis acknowledged his debt to Pallis: "I want this translation to be at the same level as Pallis." In his translation Pallis does not treat the work as a single composition written by one author; indeed, he does not even mention Homer on the title page. He translates the poem into 15-syllable lines reminiscent of a collection of oral demotic folk ballads or heroic songs in the klephtic tradition. Pallis may have gone to extremes in this translation, but he remained steadfast in his support of Greek as a spoken language; he was interested above all in making this classic work accessible and familiar to the average Greek. Pallis's definitive translation became very popular and soon the preferred translation in Greece. It was adopted by the Ministry of Education in 1976 for use in high schools until it was replaced in the 1980s by the translation of Ioannes Kakridis and Nikos Kazantzakis.

In addition to his translations, Pallis was also an epigrammatist and a poet who published poems for both children and adults. His collection of poems for children, entitled *Little Songs for Children* (1889), is included, together with some of his other poems, in a second collection entitled *Empty Walnuts* (1915). In his poems he demonstrates his skills as an educator with a continuing interest in the impact of a living Greek language on future generations. He conveys a "freshness, a gaiety and a joy of life" that is especially appealing to young people. He was concerned to provide "a living education for neo-Hellenic youth" and to ensure that the transmission of Greek culture should not be mired in the past but remain a living tradition.

Pallis appears to have given and commanded great respect and admiration. He remained a loyal and steadfast colleague and friend, especially to Nikos Kazantzakis. When Kazantzakis was soliciting subscriptions for the publication of his work on Dante, Pallis seems to have been among the handful that responded. He died in England in 1935.

JANE JURGENS

Biography

Born in 1851 to a family from Epirus, Pallis studied philology in Athens. He lived most of his life in India and England pursuing a commercial career, but he remained closely involved with the Greek language question. Known as the "great demoticist", he produced translations of the gospels and the *Iliad* as well as poems of his own in the demotic form of the language. He died in England in 1935.

Palmyra

City in Syria

Palmyra is known today – as it was in very ancient sources – as Tadmor. It lies in the heart of the Syrian desert, 200 km northeast of Damascus, at an important oasis and astride major trade routes. The geographical location of the city provided an unprecedented opportunity for the commercial exploitation of its immediate and powerful neighbours, Parthia to the east and Rome to the west. Indeed, the city derived much of its fabled wealth from maintaining a monopoly on the luxury trade between east and west. In this respect it can be said that Palmyrene trade was also responsible for advancing western goods and cultural ideas into farther corners of the east.

Palaeolithic material has been found there and the site is mentioned in Assyrian sources of the 2nd millennium BC. Biblical references suggest that it was founded by Solomon but this has long been recognized as a confusion with Tamar. Nevertheless at the time of the writing down of 2 Chronicles – perhaps by the 4th century BC – it would seem that the site had become well enough known to have engendered this confusion. The story was even repeated by the 1st-century AD historian Josephus, who describes the grandeur of the site known as Tadmor by the Syrians and as Palmyra by the Greeks. Throughout its later history Palmyrenes used the Seleucid calendar of 312 BC, although it is uncertain whether the city ever fell directly under Macedonian control.

Funerary monuments, architectural fragments (often incorporated into later monuments), and inscriptions are known from the 1st century BC, although the extent of the early city is not fully known. The earliest known attention by the western powers seems to have been an abortive cavalry attack against the city by Mark Antony in 41 BC. That this sortie was repulsed has led to the suggestion that the city was walled at this time, indicating a substantial settlement, although no archaeological proof has been forthcoming. However, inscriptions make it clear that from the reign of Tiberius (AD 14–37) Palmyra became part of the Roman world.

One of the most enduring aspects of Palmyra's cultural independence is the inscriptions which abound in its remains and record so much of its history. Palmyrene was a dialect of Aramaic but its script was related to Hebrew and Nabataean, developing into a mature monumental style by the 2nd century AD. However, from the 1st century AD Palmyrene inscriptions had become infiltrated by Greek administrative words such as *boule* (council), *strategos* (general or senator), *proedros* (president) and *grammateus* (secretary) transliterated into Palmyrene. In about AD 130 the emperor Hadrian visited the city and gave it the new epithet Palmyra Hadriane, and under the Severans it was made into a *colonia*. Even after this period,

Palmyra: remains of the Temple of Bel, dedicated in AD 32

Latin was rarely used and most inscriptions were in both Greek and Palmyrene. Palmyrene military units controlled the desert caravan routes as well as serving under Rome – as far away, indeed, as on Hadrian's Wall.

At the height of Palmyrene power and prosperity in the mid-3rd century AD, one of its leading citizens, Septimius Odenathus, was largely instrumental in saving Roman Syria from Persian aggression. He was rewarded with a string of titles and established almost royal power. After his death in AD 267 he was succeeded in all but name by his powerful widow Zenobia. Her "revolt" against Rome ultimately led to the downfall of the city when it was finally besieged and then sacked by the Roman emperor Aurelian in AD 272. After this the semi-independence of Palmyra and its brilliant culture were eclipsed and Palmyra was never again as important. Nevertheless a military garrison was set up in the late 3rd century and it had a large enough Christian community to elect a bishop by the mid-4th century.

This distinctive culture largely manifested itself in the 2nd and 3rd centuries AD but it was apparent earlier with the building of the great temple of Bel dedicated in AD 32. This building appeared to be Classical in design, resting on a Greek-style *krepidoma* (stylobate), and peripteral. However, the placing of a doorway off centre on one of its long sides was distinctly oriental as was some of its architectural decoration. Later, in the 2nd century AD, temples such as those dedicated to Baal Shamin and that to Nebo were in conventional eastern Roman style on a podium. However their *temenoi* (precincts) displayed an older repertoire; that of Baal-Shamin incorporated a distinctive Rhodian peristyle and the colonnade around that of Nebo was, unusually, Doric. Indeed most Corinthian decoration at the site was of a freer Hellenistic rather than severe Roman style. Such Greek-inspired ideas of civic munificence extended to the profusion of honorific statuary celebrating the great and good of the city. Many were placed on the brackets that adorned nearly every column of the great colonnaded street – itself a distinct element in eastern Roman architecture as was the *tetrakionion* (4-columned porch) that marked a major street junction. The agora (early 2nd century AD) contained a basilical building – unusual in the east – that is thought to have been a *kaisareion* of the imperial cult. Larger houses in the northern suburbs were of Hellenistic peristyle type, and even the earlier of the curious tower tombs are reminiscent of Hellenistic *hypogaia* (underground chamber).

It is with the sculptural arts of Palmyra that there is a more distinct break with Classical forms. There was a heavy emphasis on relief with humans and deities wearing distinctly oriental garb, the men with trousers and the women heavily veiled and bejewelled. The orientation was frontal and entirely lacks the realism of Roman portraiture. This was also usually the nature of religious reliefs; but it is interesting to note that the cult statue of the rebuilt 2nd-century AD temple of Allat was in fact a Roman copy of a 5th-century BC Greek statue of Athena. The Palmyrene pantheon remained oriental but was infiltrated by Graeco-Roman deities.

The striking ruins in the Syrian desert testify to the former grandeur of a city with the usual appurtenances of Graeco-Roman civilization. However, the city displays a unique position in the Hellenic east, one that preserved a measure of political, commercial, and above all cultural interdependence.

JULIAN M.C. BOWSHER

Summary

A city in the Syrian desert, Palmyra lies astride major trade routes between east and west. It formed part of the Roman world from the 1st century AD but retained its cultural independence. It reached the peak of its prosperity in the mid-3rd century AD when Septimius Odenathus saved Syria from the Persians. His widow Zenobia revolted against Rome, and the city was sacked by Aurelian in 272.

Pamphylia

Region of southern Asia Minor

Pamphylia consists of a broad plain along the southern coast of Asia Minor, between the more difficult mountainous territories of Lycia to the west and Rough Cilicia (Cilicia Tracheia) to the east. It is framed by mountains to the north, through which passes give access to central Anatolia. The mountains are snow-covered in winter, and give rise to rivers, the most important of which is the Eurymedon, ensuring that the plain is well watered and fertile. It is a lush region (modern crops include cotton and bananas), and is obviously a desirable area in which to live.

In antiquity its population seems to have been of mixed origin, as, indeed, its name "all tribes" suggests. It would have been known in the Bronze Age to traders sailing from the Aegean to the Levant and Cyprus, and there is a tradition of Greek settlement in the area, though whether this goes back to that period, or, more likely, reflects something of the movement of peoples in the disturbed times at the collapse of the Bronze Age states is unclear. The legendary founders of this settlement include Mopsus, a seer who was the son of Manto, daughter of Teiresias. He drove the Carians from Clarus in Ionia, where he inaugurated the famous oracle. His name has been identified on Hittite documents, and on a Luwian Phoenician inscription at Karatepe, and may therefore be Anatolian in origin, assimilated into a Greek tradition of settlement. This all brings out the mixed origins of the peoples of Pamphylia, but by the Classical period Greek certainly was established as a language of the region, in a dialect which was related to Arcado-Cypriot, implying that the Greeks did arrive at the same time as they did in Cyprus, when the dialect indicates a unity between this region and the Greek homeland. An exception seems to have been the city of Side. Arrian, writing in the 2nd century AD, says this place was founded by settlers from Cyme, but once

Pamphylia: the main street of Perge looking north

they had arrived they promptly forgot their native Greek and began to talk in a foreign tongue, which was not the usual (and, by implication, non-Greek) language of Pamphylia, but a "new" dialect of their own. Such stories reflect the mixed origins of the Pamphylians of the Classical period. There is virtually no archaeological evidence to illuminate this very early period.

By the end of the 6th century Pamphylia was part of the Persian empire. The Ionian revolt, in conjunction with the rising in Cyprus, probably sought to exclude Persian influence in this strategically important area, but failed. This policy was revived by the Athenians under Cimon, culminating in the presence of an Athenian fleet in the waters off Pamphylia and the battle of the Eurymedon, when the Persian fleet was driven up the river and annihilated. This may have led to the inclusion of the Pamphylian cities in the Delian League. The evidence for this is slight; the Athenian tribute list of 425 BC, when the tribute paid by Athens' allies was sharply increased to pay the costs of the Peloponnesian War, includes Celenderis in Cilicia and in Pamphylia Perge and Sillyon, as well as another Pamphylian city the name of which is now missing from the inscription but which is generally identified as Aspendos. Pamphylia was hardly within Athens' area of interest or control at this date, but a reasonable explanation is that the list includes, rather optimistically, all places which were once part of the alliance, and for this the period following Eurymedon is the most likely. What is clear is that when Athens and the Persian king, whether tacitly or by treaty agreement, recognized each other's sphere of influence, Pamphylia was in Persian hands; the inability of the Athenians to retain control is a reflection of the setbacks they experienced after Eurymedon, and the geographical difficulty of defending the Pamphylian communities.

Pamphylia remained under Persian control until the arrival of Alexander the Great. He first occupied Perge, where he was received by envoys from Aspendos, who surrendered their city to him, asking in return to be left free from the imposition of a garrison. Alexander agreed, but demanded in return 50 talents to pay his troops, and all the horses bred there as tribute to Darius the Persian king, implying that he did not recognize it as a Greek city to be liberated from Persian control. He also occupied Side, but had to besiege Sillyon, at which Aspendos reneged on its agreement; it was then forced to accept a governor and to give hostages. In the Hellenistic period Pamphylia first came under the control of the Ptolemies of Egypt. In the wave of Greek settlement in Egypt instigated by Ptolemy II many of the Greeks came from Pamphylia, the most distinguished of them being Apollonius of Perge, one of the greatest of Hellenistic mathematicians.

Pamphylia, however, remained vulnerable, Ptolemaic control being disputed by the Seleucid kings and by the neighbouring Pisidians. In the 2nd century BC it was taken over by

the Pergamene kings, who founded the fifth of the great Pamphylian cities – Attaleia, the modern Antalya. Through this it was incorporated with the kingdom of Pergamum into the Roman province of Asia, eventually becoming part of a joint province with its western neighbour Lycia. Attaleia had by then lost territory through its support of the pirates in the troubled times of the 1st century BC, and was forced to accept under Augustus a settlement of legionary veterans of Italian origin.

It was the period of Roman peace which brought the greatest prosperity to the Pamphylian cities, though its inland mountainous areas seem to have remained more backward. Before this the cities were probably restricted places. Arrian desribes Aspendos when it rebelled against Alexander as built on a very steep hill, the base of which was washed by the river Eurymedon. Similarly Perge includes a steep-sided hill, which may be the original settlement; small-scale excavations (not yet published) which are being carried out here may throw light on its earlier development. In the Hellenistic period Perge was extended to include a large area of flatter ground below this hill, and this was surrounded by strong fortifications, with regular tall towers to accommodate the latest forms of torsion artillery, and an imposing main gate at its southern end. Even so the place was further extended in the Roman period, with a great theatre and adjacent stadium constructed outside the earlier limits.

Perge, above all, demonstrates the strength of the Hellenic city tradition in the Roman period, when it was the metropolis of Pamphylia. During the 2nd century AD, when the region was untroubled by any major historical occurrences, the architecture of Perge was greatly enhanced, not as a part of some remote imperial gesture of support but through the wealth of its local aristocracy. The main street, running from the acropolis to the southern gate, exemplifies this; broad, paved, lined with colonnades, and with an artficial stream down its centre fed by a splendid fountain at its northern end and running in a sequence of low waterfalls as it descends towards the city gate. The theatres of Pamphylia are equally spectacular. Perge has an auditorium built against a hillside, as does Aspendos. Aspendos is structurally complete, though the decoration of its stage building has gone. At Perge the stage building has collapsed (it is now, slowly, under reconstruction) but the elements of its elaborate facade survive. At Side the theatre stands on flat ground, its auditorium supported on a vaulted substructure, though this is built entirely in the local cut-stone tradition, not employing the Roman concrete technique.

Pamphylia escaped the worst consequences of Roman decline in the period of the late empire. It was the creation of an Arab fleet in the mid-7th century AD that exposed its weakness. Prosperity seems to have suffered as a result of the rise of Islam and the loss of whole sections of the Byzantine empire, and the population of the cities declined as a consequence. The great city walls enclosed areas too vast to be defended, and unnecessary for the population. The circuit of Side was reduced, the theatre being incorporated into an inner line of defence. But the decline continued, and further Arab threats in the 10th century resulted in a similar reduced fortification at Attaleia, much of which has been destroyed only recently. At the present time, only Antalya survives as a flourishing, rapidly expanding, but essentially non-Hellenic city.

R.A. TOMLINSON

Summary

A region of southern Asia Minor, Pamphylia ("all tribes") had a cosmopolitan population in antiquity. By the Classical period the Greek language was established but the region remained under Persian control until the arrival of Alexander the Great. The prosperity of the area is indicated by the size of the Hellenic cities of Perge, Sillyon, Side, Aspendos, and Attaleia.

Panselinos, Manuel

Artist of the 13th–14th centuries

Manuel Panselinos is the name given to the master who made the important paintings in the church of the Protaton at Karyes, the capital of Mount Athos. Neither the exact date of the rebuilding of the Protaton nor the date of the paintings themselves is known. It is generally assumed that the church was rebuilt in the 13th century and it is likely that it was painted as soon as the building work was finished, since a Byzantine church could not function without its paintings.

The attribution of the paintings to Manuel Panselinos originates in oral Athonite tradition that was recorded only in the 17th century. In the 18th century the monk Dionysios of Fourna, author of the *Painter's Manual*, wrote down Panselinos's proportional rules for constructing the human figure, together with detailed measures for making the head and the face. He tells us that Panselinos came from Thessalonica and that he surpassed and eclipsed all ancient and modern painters in his abilities. There needs to be good reason to reject the Athonite attribution of the Protaton paintings to Panselinos, for oral tradition is enmeshed in the slow-moving, close-knit monastic community of Mount Athos. Two pieces of circumstantial evidence support this tradition. The first is that his proportional rules for painting, as written down by Dionysios, agree precisely with the proportions of the figures in the Protaton paintings. The second is the existence of an important series of church decorations of the late 13th and 14th centuries in southern Serbia and Macedonia, which are now termed works of the Macedonian school. The paintings in these churches follow the rules of Panselinos, as described by Dionysios, and they all show stylistic affinities to the paintings of the Protaton, while maintaining an individuality that makes it unlikely that they are by the same master.

Dionysios also tells us that many other churches on the Holy Mountain were painted by Panselinos, but these have either been overpainted with later work, or they have been destroyed. The sole surviving fragment that is certainly by Panselinos is the head of a saint from the Katholikon of the Great Lavra.

The church of the Protaton was transformed from a basilica and rebuilt as a cross-in-square at ground level, while retaining the basilican form at higher levels. This rather ungainly compromise made it difficult to give the church a standard Byzantine iconographic programme. Panselinos shows superb ability in overcoming these difficulties and has created painterly solutions in the placing of scenes and of figures that do much to unify the awkward spaces he had to decorate. Thus the upper register of the north and south walls is devoted to standing figures of the 46 forefathers of Christ descending from Adam to Joseph, the husband of Mary. The figures are enumerated as in the Gospel of St Luke. The majestic rows of figures emphasize the basilican shape and echo figural decorations of the 5th and 6th centuries, such as at Ravenna. The middle registers are devoted to scenes from the life of Christ and Mary, his mother. Here the painter innovates by sometimes leaving out the vertical red borders between scenes and by adding subsidiary if related episodes within the main scenes. Thus St John the Baptist is depicted preaching repentance in a preliminary episode to the main scene of the *Baptism of Christ*. The ground register is traditional in being devoted to standing figures with a strong emphasis on monastic and warrior saints.

In style Panselinos gives a dignity to his figures that owes much to the Hellenistic tradition of Byzantine painting. But he breaks with earlier developments in suppressing the excessive linear elaboration of 12th-century painting in favour of a much greater elegance and weightiness to his figures that recall developments associated with Giotto in Italian art of the 13th century. Similar comparisons can be made between Giotto and Panselinos with regard to the depiction of emotion in such scenes as the *Lamentation*.

Panselinos can also be distinguished as the finest painter of the Macedonian school of painting that flourished in Athonite monasteries and in Thessalonica, Macedonia, Serbia, and Constantinople in the first half of the 14th century. The earliest dated church of the Macedonian school is the Peribleptos (St Clement) at Ohrid, of 1295. More factual information about Panselinos will become available after the projected restoration of the church of the Protaton and its paintings.

Summary

According to Dionysios of Phourna (18th century), Panselinos (*fl.* *c.*1300) was from Thessalonica, was the greatest artist of all time, and invented the proportional rules for constructing the human figure. Nothing else is known of him. But he is credited with having made the wall paintings in the church of the Protaton at Karyes on Mount Athos.

Papacy

The papacy is both an institution and a concept. It is as a concept that the papacy mainly figured in relations between the see of Rome and Byzantium. The patriarchal see of Rome was recognized as such at the Council of Nicaea in 325, clearly the outstanding bishopric in the western Roman empire. By tradition the see of Rome was founded by St Peter *c.*AD 40 and was hallowed by both his and St Paul's martyrdom in the city.

In 313 the Roman emperor became the protector and benefactor of the Christian Church. The idea soon emerged that a Christian empire should have spiritual aims, but who should define these aims? The Church Fathers, imbued with Roman law and an awareness of the needs for stability, hardly ever questioned the authority of the emperor and developed the idea of divine right. The transference of the capital from Rome to Constantinople in 330 threatened a diminution in the prestige and influence of the patriarch of Rome. The First Council of Constantinople in 381 gave the primacy of honour to Rome, but it also gave to the patriarch of Constantinople the same rights and privileges as the pope. This last point was restated at the Council of Chalcedon in 451 but not accepted in Rome.

After 330 the bishop of Rome was freed from the imperial presence and thus from direct imperial pressure. Distance and the role that the popes assumed in the 5th century – of defending, feeding, and administering the city in the face of barbarian attacks – meant that they were less inclined to acquiesce in imperial decisions and more inclined to adopt social and political theories that were never developed in Byzantium to even a remotely comparable extent. They were none the less theories and did not mean that the papacy, lacking an army of its own, behaved any more independently than did the Byzantine Church; but it did have the freedom and the necessity to look for other protectors than the emperor in distant Constantinople. In 753 and again in 773 the popes were to appeal to the Frankish kings for military support against the Lombards. The coronation of Charlemagne as emperor of the Romans by Leo III (795–816) in Rome in 800 outraged the Byzantine idea of one Roman empire.

Pope Gelasius I (491–96) had defined the limits of imperial and sacerdotal authority and had stated that, of the two responsibilities, the obligation of the bishops was the heavier

since they were responsible to God for the souls of kings themselves. Until the 10th century the main question at issue was one of imperial interference in the ecclesiastical sphere. This had happened at Chalcedon in 451, and during the 8th century was marked by papal opposition to iconoclasm. The emperors sought to bring pressure on Rome by placing Illyricum under the jurisdiction of Constantinople. The 9th and 10th centuries were to see competition between Orthodox and Catholic missionaries to gain converts in Moravia, Bulgaria, and Scandinavia, while the issue of Illyricum remained unresolved.

The reform movement of the 11th century enhanced papal prestige in the west and raised once again the universalist claims of the papacy. These are summarized in a letter written by Pope Leo IX to the Byzantine patriarch Michael Keroularios in 1054 when use was made for the first time of that celebrated forgery the Donation of Constantine. This document, written in the 8th or 9th century, purported to record a grant by Constantine I to Pope Silvester of imperial powers in the west, jurisdiction over all clergy, and primacy over all patriarchates. The 11th century also saw a move on the part of the papacy for the union of the Greek and Latin Churches in one *respublica Christiana*. One manifestation was the proclamation of the First Crusade by Urban II in 1095. The drive for union was always on Western terms with the Greek Church seen as in error and, after 1054, as schismatic. No concession was made to Greek traditions or feelings. The scale of the task and the issues involved were never appreciated in the West and consequently led to failure and to increased tensions between the two communions. This was true of Innocent III's policy towards the Latin empire after 1204, of Gregory X at the Second Council of Lyon (1274), and of Eugenius IV at the Council of Ferrara-Florence in 1439. Fourteen years later the papacy was equally ineffective at raising western support for the beleagured city of Constantinople.

Papadiamantis, Alexandros 1851–1911

Short-story writer, novelist, translator, and journalist

Alexandros Papdiamantis is perhaps the best-known writer of prose fiction in Greece and occupies a legendary status as a writer. Although none of his writing was issued in book form during his lifetime, Papadiamantis's novels and numerous short stories have been frequently anthologized, and more recently, made available to younger readers in accessible, but controversial, demotic translations. A veritable industry has grown up around his life and work. His novella *I Phonissa* (The Murderess, 1903) has been adapted for the stage, as well as for the cinema in Kostas Ferris's award-winning 1974 feature, while his late "novel" *Ta Rodin' Akrogiala* (The Rosy Shores, 1907) has recently been adapted for the cinema by Efthimios Chatzis (1998). Papadiamantis's influence over subsequent Greek writers has been immense and the poet Odysseus Elytis has written extensively on his fiction (1977).

Papadiamantis was born on 4 March 1851 on Skiathos, one of the northern Sporades islands, then on the frontier of the newly established Greek kingdom. His father, Adamantios, was a priest (whence the writer's surname) and his mother's family were local landowners who came originally from the southern Peloponnese. On his mother's side he was a cousin, and close friend, of the writer Alexandros Moraitidis (1850–1929).

Papadiamantis's formal education was minimal. After attending school at Chalcis, he registered as a student in the Philosophical School of the University of Athens (1874) and for a time was a classmate of the writer Georgios Vizyinos (1849–96). Financial hardship, however, soon forced Papadiamantis to abandon higher education. He turned to a career in journalism, eking out a living as a translator for the newspapers *Ephimeris*, *Akropolis*, and *Asti*, and weighed down, after his father's death in 1895, with the responsibility of looking after his sisters. Together with Grigorios Xenopoulos (1867–1951), Papadiamantis was one of the first among the new generation of professional Greek writers to make a living from their writing. He died on 3 January 1911 in Skiathos where he had been living since 1908.

It is only in the last ten years, and due largely to the editorial diligence of Nikos Triandaphyllopoulos, that the full range and quality of Papadiamantis's translations have come to light. His translations include works by, among others, Mark Twain, Bret Harte, Jerome K. Jerome, and Alphonse Daudet. At the instigation of his friend, the writer and historian Yannis Vlachoyannis (1867–1945), Papadiamantis also translated the histories of the Greek revolution by George Finlay and George Gordon. Perhaps Papadiamantis's most remarkable translation, however, is a compelling version of Fyodor Dostoevsky's *Crime and Punishment*, translated from the French and serialized, with a preface by Emmanouil Roidis (1836–1904), in *Ephimeris*. In 1992 this translation was published in book form for the first time.

Papadiamantis's literary career was launched with the publication of the historical novel *I Metanastis* (The Emigration, 1879; published in English as *The Emigrant Woman*) in the Constantinopolitan newspaper *Neologos*. Set in the late 18th century, the romance centres on the adventures of a young Greek woman, Marina, who is left orphaned after a plague devastates Marseilles. In 1882 Papadiamantis's second novel, *Oi Emporoi tou Ethnou* (The Merchants of Nations), was published under the pseudonym Bohème, this time set in the 12th and 13th centuries. Two years later his third novel, *I Giftoula* (The Gypsy Girl), appeared in *Akropolis*. Papadiamantis's last novel takes place in the mid-15th century and explores the political and religious intrigues that divided Byzantium on the eve of Constantinople's capitulation to the

Ottomans in 1453. One of the central characters is the Neoplatonist philosopher Plethon.

In 1885 Papadiamantis published the novella *Christos Milionis*, based on a well-known folk poem and centring on Greek resistance to the Ottomans a century before. This novella is often taken to mark a bridge connecting the historical novels with the subsequent fiction. From 1887 onwards Papadiamantis, like many of the so-called 1880s generation, cultivated the short story, although *Vardianos sta Sporka* (Guardian of the Plague Ships, 1893), *I Phonissa* (The Murderess, 1903), and *Ta Rodin' Akrogiala* (The Rosy Shores, 1907) were described as novels on their publication. Numerous short stories evoke the historically rich texture of Greek rural life and the physical beauty of the Greek landscape. Papadiamantis belonged to a group of writers who gathered around the figure of Nikolaos Politis (1852–1921), the founder of folklore as a discipline in Greece and one of the chief advocates of the new ethographic literature. Writing in his autobiography about this folkloric movement, Papadiamantis's contemporary Georgios Drosinis (1859–1951) observed that the object was "to find themes from outside the cosmopolitan centres of city life in the freedom of the Greek life of the mountains and the sea". Many of Papadiamantis's short stories are, in fact, set on his native Skiathos and are replete with accounts of local traditions and customs. While the term *ithographia* remains one of the most controversial words in the Greek language, the designation is usually taken to refer to a current of folkloric realism which drew its inspiration from similar tendencies in Europe and Russia. The preferred genre of ethographic writing was the short story which centred on descriptions of local, contemporary life, with particular attention paid to rustic manners and customs. Yet, as the critic and novelist Alexandros Kotzias has pointed out, something in the region of a third of Papadiamantis's stories are set in Athens. Along with Michail Mitsakis (1863–1916) and Ioannis Kondylakis (1861–1920), he should be regarded as one of the most important Athenian writers.

Even within his lifetime, myths had accumulated around Papadiamantis. The photograph taken of him in Dexameni by his friend Pavlos Nirvanas with an early Kodak shows Papadiamantis dressed in his long overcoat (a gift sent to him from England by the writer Alexandros Pallis), and has become symbolic of the writer's otherworldliness. In his fictional biography of Papadiamantis (1948), Michalis Peranthis famously characterized the writer as a "worldly-monk" (*kosmokalogeros*). Papadiamantis continues to be promoted as a champion of Orthodoxy and traditional Greek values, in opposition to the disruptive impact of a cosmopolitan modernity. While it is certainly the case that in a number of his short stories and articles he deplores the slavish imitation of foreign ways, his fiction consistently undermines the sentimental idealism of the rural community celebrated by many of his contemporaries. Conversely, Papadiamantis's fiction tackles issues such as emigration, endemic poverty, social inequality, and prejudice. A number of his most memorable characters are neither Orthodox nor Greek, such as the kind-hearted Bavarian doctor in *Vardianos sta Sporka*. Many of his protagonists are both victims and victimizers. Papadiamantis's best-known work is *I Phonissa*, subtitled by the author "a social novel". First published in the journal *Panathenia* (1903), the narrative focuses on the activities of an old woman, Frangoyannou, who roams the island of Skiathos killing female infants and is eventually drowned in the sea "midway between divine and human justice".

Although much of Papadiamantis's fiction is written in katharevousa, his writing exploits the full range of the Greek language from the gruff demotic of the local Skiathos idiom, to liturgical Greek, back to antiquity. In a celebrated passage in his short story "The Black-Kerchiefed Woman" (1891), for example, the narrator quotes lines from the *Iliad* when he likens the wind rippling a cornfield to the waves of the sea.

Critical responses to Papadiamantis's fiction have not been unreservedly positive. In his *History of Modern Greek Literature* (1948), the influential critic K.T. Dimaras famously condemned Papadiamantis's myopic vision and the "closed world" which he depicted in his fiction. Critical assessments continue to be polarized between those who construe Papadiamantis as a deeply traditional writer and those who argue that his fiction is, in fact, highly experimental and questioning. In the first case, Papadiamantis's biography provides the overarching framework within which his work must be read, even while his fiction is scrutinized for any documentary evidence it might furnish. In the second case, an attempt is made to ignore extraneous material and concentrate exclusively on exhaustive textual exegeses. Georgos Kechayioglou's structuralist reading of the short story "Love in the Snow" (1981) and Georgia Farinou-Malamatari's pioneering study *Narrative Techniques in Papadiamantis* (1987), for example, draw attention to both the linguistic range of Papadiamantis's prose and to his fiction's innovative narrative strategies. Criticism of Papadiamantis has not been without its share of rancour, as in the acrimonious debate that followed the publication of Panayiotis Moullas's controversial anthology (1974) in which he argued that Papadiamantis's writing was symptomatic of the author's ungratified sexual impulses, and of an overriding feeling of impotence that derived from a dominant father and a suffocating environment. More recently, however, critics have sought to avoid the worst excesses of these formalist and biographical approaches by combining close readings of the texts with an awareness of the wider cultural and political contexts within which Papadiamantis's writing was produced and consumed. The bibliography of secondary work on Papadiamantis is immense. Between 1981 and 1992 a new five-volume edition of the *Collected Works* appeared, edited by Triandaphyllopoulos. In 1992 a Greek journal was established devoted to Papadiamantean studies.

Biography

Born in Skiathos in 1851, Papadiamantis was educated at Chalcis and enrolled at the University of Athens but was forced to abandon his studies. He became a journalist, and later a short-story writer, novelist, and translator. He wrote three historical novels and some 200 short stories and translated many works from French and English. He died in Skiathos in 1911.

Papadopoulos, George 1919–1999

Leader of the military junta that seized power in 1967

Born and raised in the rural environs of Patras within a priest's family, George Papadopoulos grew up in the spirit of middle-class conservative ideals. An excellent student and cadet, he had always distinguished himself with high marks and significant rankings. As a result, after graduation from the military academy in 1940, he was appointed to good positions in the army, especially in intelligence posts.

As a junior officer, he participated for a short period in the Albanian campaign and afterwards, like many of his colleagues, took part in the resistance movement against the Axis. When Greece was liberated in late 1944, another series of appointments in the intelligence service was supported by special training in the USA.

Moving among officers of high standing and displaying close understanding of the politics of Greece, Papadopoulos soon became involved with serious-minded groups which were concerned and worried by the political instability of the postwar period. Meanwhile, all such groups expressed fears of the communist threat that resulted from the state of flux of Greek politics, a threat that was also prolonged by the Cold War.

Papadopoulos had been a senior officer and had received broad recognition of his qualities within the military, but he was unknown to the general public, as he remained away from the public eye. The only time that his name was publicly mentioned was in 1964 when, serving in Thrace, he staged the destruction of military matériel, blaming the incident on the communists. Following this episode, which offered him favourable exposure, he was assigned to the First Army group, and shortly thereafter to the General Army Staff headquarters in Athens. Political developments stimulated the military hierarchy to concerns about its future as well as the danger of a liberal government assuming a leading role in national policy making. This situation caused Papadopoulos and his colleagues to fear that the eventual return of George Papandreou to power could mean the restructuring of the "ranking officers of the armed forces who were, in the main, anti-communists and supporters of the monarchy".

Fear of the destabilization of the military status quo was the primary reason on which the colonels moved in on the night of 20 April 1967. Rumours of an imminent coup had circulated for several months, and it was no surprise to the Athenians, when waking up on 21 April, to find that the parliamentary government had been toppled. The race to power was won by the colonels who, having formed the structure of the armed forces, were capable of mobilizing them effectively. For some years a number of groups had been toying with the idea of a coup, which is why even the identity of those responsible for 21 April represented an enigma for the first few days. Swift action by the armoured units combined with deployment of selected personnel under Papadopoulos's instructions enabled them to assume key positions in the capital, to take over communication posts, and to detain several thousand citizens involved in political movements. The coup d'état of April 1967 brought to power a small group of officers led by Papadopoulos who managed quickly to secure the reins of power through the imposition of martial law. The king had no choice but to comply. He accepted the cabinet proposed by the colonels and placed as its head the former attorney general of the Supreme Court Konstantinos Kolias, a man who commanded general respect. Brigadier Stylianos Patakos took over the Ministry of Interior, and colonel Nikos Makarezos the Ministry of Coordination. Papadopoulos maintained a low profile, remaining minister to the prime minister's office.

While the new regime tightened its grip, relations with representatives of the civil government as well as with foreign governments continued to deteriorate. The situation in Cyprus was no closer to a resolution and relations with Turkey became strained due to the clashes on the island which reached critical levels in October and November 1967, resulting in casualties. Turkey threatened to land forces in Cyprus. In an attempt to reach a compromise Athens recalled general George Grivas from Cyprus, thereby arresting the guerrilla war against the

British, as well as reducing the Greek forces on the island from several thousand to 950.

The humiliation over Cyprus isolated Papadopoulos and his regime. King Constantine saw this as an opportunity to attempt a counter coup which he staged on 13 December 1967, assisted by the Third Army Corps of Thrace in east Macedonia. This attempt quickly collapsed and the king realized right away that he did not have the support needed for such an undertaking. He fled from the country while the junta began exercising tighter control of the government. This was the moment when Papadopoulos assumed the position of prime minister and minister of national defence.

Greece's isolation had a negative effect especially with regard to relations with the USA and the countries of the Common Market (now the EU). President Johnson suggested that the continuation of military aid to Greece would depend to a great extent on the return to a more democratic system of government. At the same time the Council of Europe threatened Greece with expulsion if steps were not taken towards installing a more democratic government. As a result of these pressures, in September 1968 the regime called for a plebiscite, attempting to legitimize the new constitution of the military government. Signs of weariness eventually began to appear in Papadopoulos's government. The student movement and the large demonstration at the Faculty of Law in Athens signalled the beginning of the end of the colonels' rule. Then discontent and disapproval in the navy, with the destroyer *Velos* under admiral Nikos Pappas defecting to Italy, showed strong evidence of the changing mood of the country, and alerted Papadopoulos and his colleagues who tried to gain a temporary victory by abolishing the monarchy and instituting a republic with Papadopoulos as president. Furthermore, he started meeting, secretly at first, and later publicly, old political figures who would be prepared to participate in an effort to bring democratic rule back to the country in preparation for parliamentary elections. Public opinion, however, did not seem to favour these attempts and the efforts of the junta to impose its authority were rapidly waning. It was then that a serious student demonstration occurred at the Athens Polytechnic which ended in bloodshed on 17 November 1973, halting the efforts of the regime to restore democracy. Papadopoulos was toppled by his colleague Dimitrios Ioanides whom he had appointed from the start of his regime as chief of the military police. Thus the reign of George Papadopoulos came to an end and the new junta took over.

The Ioanides government was even weaker than the Papadopoulos government of late 1973, and in 1974, in an effort to regain lost prestige, general Ioannides attempted to overthrow president Makarios of Cyprus and to bring about the union of the island with Greece. This fatal mistake not only brought about the dramatic fall of the junta, but also resulted in the invasion of the island by Turkey.

In those tragic days, all political parties joined together under the aegis of Constantine Karamanlis, and gradually normal life was resumed in Greek politics and society. As was to be expected, the members of the junta were tried and its leaders were sentenced to death, a penalty which by the personal intervention of premier Karamanlis was commuted to imprisonment for life.

Throughout the duration of his rule, George Papadopoulos proclaimed that Greece is the country of the Christian Greeks and this concept was no doubt well rooted in the dictator's mind. However, power obscured from him the crucial question of how the Greek people felt in their everyday lives about being governed by a man who had been unknown to the general public, but who more importantly had assumed office without the consent of the people.

Biography

Born in 1919 near Patras, Papadopoulos graduated from the military academy in 1940. After war service he became involved with right-wing political groups. Fearing destabilization of the military position, he led a coup on 21 April 1967 which resulted in the imposition of a military junta. After a failed counter-coup by the king in December 1967, Papadopoulos became prime minister. He was toppled in 1973 by his colleague Dimitrios Ioanides. The junta was ended in 1974 and its leaders were sentenced to death. Papadopoulos's sentence was commuted to life imprisonment, and he died in 1999.

Papagos, Alexandros 1883–1955

Soldier and politician

The son of a lieutenant general, Alexandros Papagos surpassed his father by reaching the rank of field marshal. Following his retirement from the military, he felt compelled by the situation of the country to enter politics, becoming prime minister for the last three years of his life.

He received his basic training in Athens, and enjoyed further military studies in Belgium with the Brussels Military Academy and the Cavalry Institute between 1902 and 1906.

As a result of his brilliant student career he had no difficulty in achieving rapid promotion and important positions. As second lieutenant in 1910 he was assigned as adjunct to the Ministry of the Army, and by 1912, when the Balkan Wars erupted, he was promoted to lieutenant in the cavalry, having been among the officers close to prince Constantine, commander of the Greek armies in Epirus. For his dedication to duty and for his conduct in battle he was commended for bravery in the Bizzani campaign of February 1913, which resulted in the liberation of Epirus by Greek forces. Such distinctions enabled him to achieve high positions: in the first cavalry regiment of Thessalonica, as staff member of the Athens cavalry brigade, staff member of the third Greek army in Thessalonica, and finally, in 1917, a cavalry major.

In 1917 the clashes between royalists and Venizelists reached their peak, dividing the country into two camps and thus affecting the career of the royalist Papagos, who for a while received minor appointments in the Cyclades and Crete away from decision-making locations. In 1920, as lieutenant colonel, he fought in the disastrous Asia Minor campaign and after that, when an "ecumenical" government took over in 1926, he was promoted to the rank of colonel and given the command of the Larissa cavalry division, a position which he held until 1931. Thereafter he served as commander of the Larissa headquarters, and later, as major general, commander of the first and third army groups.

The career of general Papagos in the military was supported by his involvement in politics in which he always stood on the royalist side. In the company of his close colleagues, he became involved in small coups which were commonplace during the turbulent period 1926–1932 in Greece, serving as minister of defence in the governments of Icondilis (10 October 1935–30 November 1935) and Demertzis (19 December 1935–5 March 1936). This brought him membership of cabinets from time to time and, when the military regime of Ioannis Metaxas took over in 1936, the position of inspector general of the army was entrusted to Papagos. Soon thereafter, as the first clouds of World War II began to gather, he was named commander in chief of the army staff headquarters. This position gave him the opportunity to embark on a thorough and rapid restructuring of the Greek armed forces as well as to prepare the defence of the country against the (by then obvious) plans of the Axis to invade Greece through Albania. This sudden invasion was begun by Italy in October 1940, at a time when the greater part of Europe had already been occupied, or had capitulated to the Axis.

Much to the surprise of the military experts and students of history, the efforts to reorganize the army paid off when the Greek forces not only arrested the invasion by Italy, but by counterattacking managed to occupy half the territory of Albania. This represented the first victory of the Allied forces against the Axis, and part of that glory was recognized as being due to General Papagos. As expected, Germany could not ignore the defeat of the Italian forces; nor could Greece continue to be victorious in the Albanian campaign against the Italians. So Hitler helped Mussolini by attacking and occupying Greece in April 1941. The Greek army capitulated and the occupation of Greece followed, bringing immense problems to the people while numerous pockets of resistance sprang up throughout the country.

During the occupation (1941–44) Papagos was arrested and sent to concentration camps in Germany. Upon the defeat of the Axis powers he returned to Greece, devoting most of his time to writing, first his personal experiences in German concentration camps, and then his magnum opus which was an extended military study of the war in Greece of 1940–41 containing much valuable military information.

Highly appreciated for his accomplishments, but lacking popular recognition and high honours, Papagos was promoted to full general by the Greek parliament in 1947. Shortly thereafter, he was recalled to active duty by the national government and placed in charge of the campaign against the communist guerrilla forces.

By September 1949, under the leadership of Papagos, the Greek armed forces had managed to suppress the partisans. In recognition of his qualities and as an expression of the nation's appreciation, Papagos was promoted to field marshal, an honour which had never before been given to a member of the military.

An active and dynamic man like Papagos could not remain idle for very long. Conscious of the needs of his country, he assiduously dedicated himself to the creation of the Ministry of National Defence and the Academy of National Defence. He was also responsible for raising the moral and material standards of enlisted officers and for supervising Greece's membership of international alliances and finally NATO.

Greece, however, had been undergoing a period of political instability since the end of World War II. Antiquated political methods and the weak parliamentary multi-party system remained a barrier to the necessary social and economic development of the war-devastated country. A strong personality was needed to secure Greece in the Western camp, and it was found in marshal Papagos.

Though he had little experience of politics, he recognized the need for a powerful leader, and brought together the old political parties to form the Greek Rally party which in 1952 won a great electoral victory, using a system of proportional representation. Thus marshal Papagos formed a strong cabinet of distinguished personalities, quickly stabilizing the political environment in Greece during the following three years. The economy too showed signs of revival following the devaluation of the drachma on 9 April 1953, healing some of the wounds of the war.

Nevertheless, in 1953 he took the initiative in claiming the independence of Cyprus from Great Britain, resorting to various vague promises made to Greece both before and during World War II. He was also motivated by the British policy at the time of granting independence to countries that had been crown colonies. His claim embittered the British, creating a rift in diplomatic relations. In October 1955, following a period of illness, field marshal Papagos, prime minister of Greece, died. His memory is venerated by the Greek people in general and by the military in particular.

STELIOS ZACHARIOU

Biography

Born in 1883 the son of a soldier, Papagos was educated in Athens and pursued military studies in Brussels from 1902 to 1906. He served in the Balkan Wars of 1912–13 and in 1917 supported the royalist side against Venizelos. He fought in the Asia Minor

campaign in 1920–1922. As chief of general staff under Metaxas he restructured the armed forces which gave him credit for the success in Albania in 1940. After the war he entered politics and became prime minister from 1952 until his death in 1955.

Papanastasiou, Alexandros 1876/79–1936

Founder and prime minister of the first Greek republic

Alexandros Papanastasiou was born in Tripolis, in the Peloponnese, the second son of a schoolmaster holding a PhD in philology who was later head of directory at the ministry of education. His studies at the law faculty of Athens University (1895–99) were followed by graduate studies in sociology, politics, and economics in Heidelberg and Berlin (1901–05) and further studies in London and Paris (1905–07). On his return to Athens Papanastasiou played the leading role in the foundation of the Sociological Society (1908) and its journal, *Social and Law Sciences Review*. He supported the modernization-motivated Goudi military coup of 1909, to whose leader colonel N. Zorbas the Sociological Society submitted a reform programme drafted by Papanastasiou. In 1910, with the members of the Sociological Society and on a reformative socialist platform, he founded the People's Party, which from 1915 was to become the left wing of Venizelos's Liberal Party.

Papanastasiou first entered parliament as a People's Party deputy for Arcadia in the first revisionary national assembly of August 1910 and again in the second one of November 1910, heading a seven-member group of the so-called Sociologists. He volunteered in the first Balkan War, taking part in campaigns on Chios and in Epirus. In the National Schism in 1916 he followed E. Venizelos in the establishment of a parallel/rival provisional government in Thessalonica. As its representative in the Ionian islands he succeeded in June 1917 in organizing the landing of Greek and French troops in Preveza, thus blocking the Italian advance in Epirus. He first held ministerial office as minister of communications (1917–20) in the 1917 Venizelos government formed in the wake of king Constantine I's departure and Venizelos's return to Athens as unopposed premier. In this capacity he worked hard for the reconstruction of Thessalonica and other damaged towns in Macedonia.

Following Venizelos's surprise defeat in the election of November 1920, and the return of Constantine to the throne, sanctioned by a rigged plebiscite, Papanastasiou expressed bitter criticism of the monarchy. With his *Republican Manifesto* of 12 February 1922 he pronounced against the return of Constantine as endangering the advantageous position Greece had attained by the Treaty of Sèvres (1920). Arrested for this and sentenced to three years' imprisonment, he was released in the wake of colonel Nikolaos Plastiras's military coup of 1922. Meanwhile, alienated from Venizelos and the Liberal Party, he founded the Republican Union in 1922 as a republican coalition of lower middle, agrarian, and working classes to pursue a purely anti-royalist policy. Following the election of December 1923, he entered the fourth Constituent Assembly as head of 70 deputies of his party (out of 398). In January 1924, within one month of the forced departure of king George II from Greece "on leave", Papanastasiou, as leader of the opposition in the national assembly, proposed the abolition of the monarchy and the establishment of a republic. This he effected as prime minister in his first government, formed on 12 March 1924, with the proclamation of the first Greek republic on 25 March 1924, fully ratified by plebiscite (receiving support of 69.95 per cent) the following month. Despite its parliamentary character, the Papanastasiou cabinet retained an authoritarian stance due to its distinct association with a group of "republican" army officers. Within four months the authority of his government had been sufficiently injured, especially because of the inextricable as well as troubled civil–military relationship, to step down on 19 July, after defiance broke out in the navy.

Initially tolerant, in fact conciliatory, towards general Pangalos's coup of 25 June 1925 and the general's early disingenuous maneouvres for a civil cabinet, Papanastasiou came out in time overtly against the dictatorship, and was banished to the island of Santorini in February 1926, as a result of his protests at the suppression of *Democracy*, his party's press organ. In the election of November 1926, following the restoration of the republic, the Republican Union, now subtitled "Agrarian and Labour Party", won 6.48 per cent of the vote and 17 seats in the assembly. Papanastasiou participated in the all-party government of Zaimis in December 1926, taking on the ministry of agriculture (1926–28). Within the term of office of the same assembly, he was elected head of the parliamentary committee on the promulgation of the republican constitution of 1927. In the election of August 1928 Papanastasiou's Republican Union / Agrarian and Labour Party cooperated with the Liberal Party and won 6.71 per cent of the vote and 20 seats in the assembly.

In October 1929 Papanastasiou presided at the peace conference held in Athens, where he expounded the idea of Balkan union as a model for that of the European states. One year later he chaired the first Balkan Conference in Thessalonica, achieving distinction for his dedicated work on the idea of Balkan cooperation. This initiative he pursued with unfailing interest at the ensuing Balkan conferences held from

1931 to 1933. In the same years he attended international congresses of agrarian and radical parties.

Papanastasiou formed his second ephemeral government in May 1932, but resigned eight days later over a quarrel with the Liberals relating to the social care issue. He became deputy for Mantinea in the election of September 1932, his Agrarian and Labour Party winning 5.89 per cent of the vote and 8 seats. He last held office as minister of national economy and (provisionally) agriculture in the last Venizelos government in January 1933. He was elected a senator in March 1933 but resigned a few weeks later. Persecuted and arrested in the abortive Venizelist coup in March 1935, he was eventually acquitted by a military court. He abstained with his party from the election of June 1935. He opposed the Kondylis dictatorship and pronounced publicly against the scheduled, and finally rigged, plebiscite of November 1935 for the return of king George II. He won a seat as deputy in the election of January 1936, his party commanding seven seats in the revisionary assembly. He died in Ekali, Attica, in November 1936 during the dictatorship established that August by General Metaxas, to whom, as president of a still parliamentary government in April, Papanastasiou had denied a vote of confidence.

Papanastasiou represents a revitalizing and socialist-oriented element in Greek political and social thinking of the first decades of the 20th century. His ideas were related to the rise of socio-economic and political radicalism before and during the interwar period; they may be traced back to the ideological and intellectual trend that began in the late 19th century with the inchoate efforts of the first Greek socialists. In the light of his sociological background he initiated a seminal discourse on the social question of Greece and drew attention to cardinal matters of social justice and economic development, notably land reform and the protection of the lower and working classes. His sociologists, combining academic prestige with political action, played a leading role within and outside the national assembly, and exerted influence on Venizelos's Liberals to promote the modernization of Greek society. The views he put forward, pioneering to a significant extent, came as a response to the country's vague quest for a renewal, which found its earliest expression in the Goudi military coup. Already in the programme he drafted then, unambiguously entitled "What is to be done?", he had comprised a constellation of measures to give substance to the call for a modern state, including distribution of *çiftliks* (large estates), general income tax, educational reform, proportional electoral system, compulsory social security for the workers, etc. In line with this, he aspired with increasing militancy in his political career to the reform of iniquitous institutions, democratization of the state, and to the elevation of the feebler social strata in all aspects of life. Education attracted his particular care, including training for former dropouts, and, as first republican premier, he founded the Thessalonica university, despite mounting reactions.

In foreign policy Papanastasiou stood for the union of the Balkan states, reviving the prerevolutionary vision of Rigas, and attended all four Balkan Conferences held from 1930 to 1933, behind which he was the driving force. Regarding Graeco-Turkish relations, in particular, he saw in the 1922 Catastrophe and the ensuing exchange of populations, which removed a perennial source of discord, an opportunity for a lasting understanding between the two countries, a policy that was realized shortly afterwards by Venizelos.

RENNOS EHALIOTIS

Biography

Born in the late 1870s in Tripolis in Arcadia, the son of a schoolmaster, Papanastasiou studied law at the University of Athens and continued his studies in Heidelberg, Berlin, London, and Paris. In 1910 he founded the People's Party and entered parliament that year as deputy for Arcadia. He served as minister of communications in Venizelos's government of 1917–20. Imprisoned for his *Republican Manifesto* in 1922, he became prime minister of the first Greek Republic in 1924–25. He was a supporter of Balkan union. He died in 1936.

Papandreou family

Georgios Papandreou (1888–1968) was born in the village of Kalentzi in the Peloponnese and studied law at Athens and political science in Germany. A politician of the liberal centre, he became prime minister of the Greek government in exile in Cairo during the war and faced the communist insurrection upon his return to Athens in the winter of 1944. He found his true calling in Greek politics late in his life as the rallying force of a wide coalition that made up the Centre Union Party and challenged the authority of a conservative state. He defeated Constantine Karamanlis's ruling party in the elections of 1963 but resigned from his office as prime minister because of his disagreement with king Constantine II over the control of the military. This crisis of the mid-1960s caused the subsequent military intervention of 1967.

His flamboyant style and his turbulent family life left an indelible mark on his elder son, Andreas Papandreou (1919–96) who was born in Chios while his father was the prefect of the island. Andreas began his studies at Athens University and completed them at Harvard. He became part of the "new left" establishment in the USA during his career as professor of economics at Minnesota and Berkeley, and returned to Greece in 1961 to head the Centre for Economic Studies. He was elected deputy of Achaea in 1964 and served as minister of coordination in his father's Centre Union government between 1964 and 1965. As the left-wing advocate of his party he became a prime target of the military junta that took over in 1967. He was released from confinement through the intervention of US president Lyndon Johnson and allowed to leave the country. Throughout his years in exile he campaigned against the military regime and founded the Panhellenic Liberation Movement (PAK) which was later transformed into the Panhellenic Socialist Movement (PASOK). He returned to Greece two months after the fall of the junta and became a leading light of the political scene. He was a member of parliament from 1974 to 1996 and prime minister from 1981 to 1989 and 1993 to 1996.

Andreas Papandreou has been the most accomplished turncoat in Greek politics. A person of immense personal charm and with an intelligence quotient that towered over his own generation of politicians, he performed about-turns in policy without alienating his supporters. When the ratification of Greece's accession treaty to the European Community was brought before parliament for discussion in 1980, Papandreou and his PASOK deputies walked out of the debate and declared their unyielding opposition to the EC. Once in power (a year and half later), this negative attitude was dropped as $800 million from EC funds were directed to Greece's rural areas. In his second term he became the champion of the EC in Greece.

Papandreou's most significant action as premier *vis-à-vis* the EC was the Greek Memorandum which set conditions to future enlargement demanding the implementation of the "Intregrated Mediterranean Programmes" designed to finance and assist Mediterranean countries of the EC with structural impediments to development. At the December 1985 summit in Luxembourg, Papandreou withdrew his reservation for the amendment of the Rome Treaty which would facilitate the decision-making process in the EC by limiting the use of the veto. The measure was advantageous to the Community's larger members and Papandreou's cooperativeness was rewarded with the formal recognition of the "convergence" between the economic structures of member countries – a principle which favoured the weaker states, including Greece.

While in opposition (1974–81), Papandreou vowed that his future government would withdraw Greece from NATO and remove American bases from Greek soil. However, his defence policy after his October 1981 electoral victory did not deviate substantially from that of his predecessors. In 1983 he signed an agreement with the United States that renewed the tenure of American installations and then celebrated with his followers the beginning of the process of removing the US bases from Greece.

Papandreou's foreign policies, stripped of their more sensational declaratory aspects, were not as different from those of many other Western states as was widely believed. Yet he insisted on creating the impression of being a far greater maverick than his actions would seem to imply. In doing so he was addressing a Greek public that was thrilled with the prospect of attracting European attention after years of docile agreement on basic Western tenets of foreign and security policy. Furthermore, his tactics of appearing as an uncompromising champion of Greek interests, combined with widespread promises of social benefits, were the binding tissue that kept the wide spectrum of his followers together.

During Papandreou's terms in power, a significant income redistribution was effected but this was not accompanied by economic growth and was mostly financed by loans. The implication of this social policy was that its cost would burden future taxpayers.

As a politician who improvised from day to day, rather than planning ahead, Papandreou postponed confronting the mounting problem of Greece's debts until his final term in office. By then his health did not allow him more than a few hours of work per day, but somehow this last term proved to be the most constructive. After a bumpy start, Greece improved relations with Albania and FYROM (Former Yugoslav Republic of Macedonia) and the economic ministers imposed an austerity programme in line with European Union convergence requirements, which survived Papandreou's leadership.

He was survived by three sons and one daughter. His eldest, Giorgos, was in 1998 alternate foreign minister.

Paparrigopoulos, Konstantinos 1815–1891

Historian

Konstantinos Paparrigopoulos is known as the national historiographer of Greece. He lived in a period of rapid changes in the Balkans, interminable political struggles, and ideological resurrections both outside and within the newly established independent Greek state. Born in Constantinople, he would have been raised and educated within the illustrious Phanariot society of rich merchants if the revolutionary events of 1821 had not left him an orphan and his family obliged to look for a safer environment in Odessa. It was not until 1830 that his family sought a permanent residence in Greece. The youthful Konstantinos never received a university education, but he had the advantage of attending classes given by the liberal Georgios Gennadios (1786–1854). Practically a self-made scholar, he became a polymath and a polyglot, as shown by his remarkable familiarity with the principal French, German, and English works on Greek history. From 1834 to 1845 he worked for the Greek Ministry of Justice, but resigned because of the rivalry between the native (*autochthones*) citizens, who were supposed to have actively participated in the revolution and thus the destinies of the nation, and the freshly settled immigrants, only nominally Greek (the *eterochthones*), the educated elite. This rivalry, indicative of the factional strife that plagued Greek society, was indeed a traumatic experience for Paparrigopoulos, but it convinced him that his compatriots needed to subscribe to a higher vision of national unity in order to override sectional interests. The propagation of such a vision in the 1840s, rooted in the irredentist Great Idea, provided the essential political and intellectual stimulus that turned him into the historiographer of Hellenism par excellence.

Before his appointment as professor of history at the University of Athens in February 1851, Paparrigopoulos published several studies related to historical issues either as monographs or as newspaper articles – some of them subsequently included in his *Istorikai Pragmateiai* (Historical Essays, Athens, 1858). The starting point of his literary career may be considered his work *Peri tis Epoikiseos Slavikon tinon Phylon eis tin Peloponnison* (On the Slavic Colonies in the Peloponnese, 1843), followed by his *To Teleutaion Etos tis Ellinikis Eleutherias* (The Last Year of Greek Freedom, 1844). The former was a critical reply to Jakob Philipp Fallmerayer, who in his *Geschichte der Halbinsel Morea während des Mittelalters* (2 vols, Stuttgart, 1830–36) maintained that after the extensive Slavic conquests at the close of the 8th century the original population of northern Greece had practically disappeared. Thus the modern Greeks, according to Fallmerayer, were Byzantinized Slavs. Coming at a time when the Greeks were seeking that necessary consciousness of their identity and pre-statehood nationality with a view to enlarging their frontiers to take in the huge non-liberated lands, which included (*inter alia*) Constantinople and the coastal regions of Asia Minor, such discouraging racist theories as Fallmerayer's naturally caused widespread resentment. For Paparrigopoulos, it was essential to show that casting doubts on the archaic origins of the modern Hellenes, and thereby depriving them of the distinction of having preserved and even consolidated Orthodoxy during the Byzantine period, was wrong as a "scientific" historical account and pernicious for the nation's self-consciousness and development. In the latter work, Paparrigopoulos examined the fall of Greece to the Romans in 146 BC. The substance of his theoretical approach to the study of Greek history is there delineated clearly and unequivocally, and his faith in the continuity of the Greek nation is pervasive. Discord and division are recurrent themes in the traceable chain of Greek historical development, yet the concept of unity through evolution should predominate in any thoughtful examination of Greek history.

The aims and ideas presented throughout Paparrigopoulos's early writings place him directly in the camp of the conservative, anti-modernist Neohellenic intelligentsia, which was concerned with affirming the legitimacy of irredentism by invoking historical, broadly cultural, and religious factors. Romantic nationalism and religious fundamentalism contributed to the decline of the liberal tenets of the 18th- and early 19th-century Greek Enlightenment, and inevitably clashed with its enthusiasm for westernized educational and institutional reforms. Markos Renieris (1815–97) in his *Dokimion Philosophias tis Istorias* (Essay on the Philosophy of History, Athens, 1841) confidently declared the collapse of individualism and asserted the superiority of the Christian religion over the secularist tendencies of the 18th century, associating the failure of the Enlightenment with the historically justified political aspirations of Greece in the east. The genuinely ideological use of historiography becomes manifest in the works of Paparrigopoulos's predecessors. In his preface to *I Konstantinoupolis* (Constantinople, 1851) Skarlatos Byzantios (1798–1878), while arguing that medieval Hellenism and the Byzantine empire are part and parcel of Greek history, tried to establish the unbroken continuity of the Greek nation. Spiridon Zambelios (1815–81), in the Introduction to his *Asmata Dimotika tis Ellados* (Greek Popular Folk Songs, 1852) and *Byzantinai Meletai* (Byzantine Studies, 1857), highlighted the inexorable religious and ethnic bonds of the Byzantines with the modern Greeks. The national continuity was similarly emphasized by turning attention to the glorious – usually Christianized – Classical past, the defeat of the Persians, the Athenian empire, and the civilizing march of the Graeco-Macedonians in the east under Alexander the Great. In several texts replete with linguistic archaisms (serving as a proof of the diachronic unity of Hellenism), Alexander emerged as the symbol of Greek unity and provided the impetus for recovering the universal glory of the past. Konstantinos Asopios's speech of 1856 as the new rector of the university was characteristically devoted to Alexander. In introducing the new version of his speech (Athens, 1858), he stressed once again that the king of Macedon was the symbol of unity for the Greeks (*symbolon enotitos*). Not surprisingly, J.G. Droysen's *Geschichte Alexanders des Grossen* (Berlin, 1833) was very popular and a Greek translation by K. Frearitis was published in 1859.

The ground for Paparrigopoulos had been chalked out. Between 1849 and 1852 he issued a *General History of Greece* for use in schools, covering the Classical period and the Middle Ages, a prelude to the magnum opus that followed. In its two volumes he stands out prominently as the ideological spokesman for Greece. The ethnological continuity of the

Greek people is traced through three substantially interconnected stages of their historical development. At each stage, the nation had fulfilled a great mission: the Classical period gave to the nation (and indeed the whole of humankind) the institutional and normative framework of political existence; Byzantium fulfilled the apostolic duties of Christianity; during the third period, which started with the liberation from the Ottoman yoke, the nation is destined to fulfil the political and religious programme of the Great Idea. In his *Istoria tou Ellinikou Ethnous* (History of the Greek Nation, 5 vols, Athens, 1864–75) Paparrigopoulos went even further, arguing that the nation's pagan ancestors, and especially the Macedonians Philip and Alexander, were predestined by divine providence (*theia pronoia*) to pave the way for the Greek Christian empire that flourished in the Byzantine era.

The arguments put forward in the *History* are scholarly and the investigations conducted often exhaustive. But Paparrigopoulos was concerned with the development of national consciousness. He was a servant of Greek society and wrote history in a manner that had meaning and significance for his audience. He believed in progress from age to age, in which however the past was ineradicably embedded in the present. To some extent Paparrigopoulos followed contemporary historians in western Europe who envisaged the unfolding of the past as subject to a series of general laws. In his "Poion to ek tis Istorias Ophelos, kai Pos Deon na Spoudazomen autin" (What is the Use of History, and How We Must Study It, *Amyna*, 4 February 1872) he insisted on an "immutable and universal law of humanity", which he immediately resolved into a cofunctioning of "external change" with "a cluster of immovable ethical values". On another level, a nation is subject to its own particular historical laws such as those revolving around patriotism, religion, and language. The annals of history instruct that no nation can ever attain glory through the unchecked exercise of "infidelity, lawlessness, licentiousness, ignorance". Earlier Paparrigopoulos defined the "technical" qualifications required of a historian: precision, good judgement, ability to elaborate on the character of historical actors, imagination in recreating the past, excellent use of the linguistic apparatus (*History*, vol. 2, Athens, 1862, pp.106–07). Paparrigopoulos was well read in European historiography. The names of E. Gibbon, F. Guizot, the liberal utilitarian G. Grote, the representatives of the romantic school J. Michelet and A. Thierry, T.B. Macaulay, and many others are often mentioned in his narrative. Indeed his familiarity with scholars with diverse approaches to historical material is striking. Some of them were distinguished representatives of the interdisciplinary, empirical *Altertumswissenschaft* (science of antiquity). Paparrigopoulos was competent to apply the new streams to his subject, but Greece urgently needed a moralizing prophet and a dramatist of the achievement and the imperishable glories of the nation.

The "Epilogue" of the *History* was published independently in 1877, summarizing the major themes and arguments. A French version appeared as *Histoire de la civilisation hellénique* (Paris, 1878). A second and final edition of his *History* appeared between 1885 and 1887. During the last years of his life he was actively engaged in politics and diplomacy. He was involved in the Association for the Propagation of Greek Letters, which claimed on the basis of E. Stanford's new ethnological map (London, 1877) that Macedonia as far north as the Balkan mountains was predominantly Greek; he also presided over the Central Committee of the Council of National Defence, established to coordinate and support the revolutionary movements at the time of the eastern crisis, in which the irredentist ambitions of Greece culminated. At the close of his life he published another volume of *Istorikai Pragmateiai* (Historical Treatises, Athens, 1889), and left his "last will", *Ta Didaktikotera Porismata tis Istorias tou Ellinikou Ethnous* (The Didactic Conclusions of the History of the Greek Nation) to be published posthumously in 1899.

Paparrigopoulos's legacy was by any standard prodigious. His treatment of Classical Greece reproduced to a great extent the conclusions of European historiographers, but his handling of the Byzantine Greeks broke new ground. Ideology and erudition coalesce in his historical masterpiece. His successors at the University of Athens, especially Spyridon Lampros (1851–1919), Pavlos Karolidis (1849–1930), Konstantinos Amantos (1874–1960), and Sokratis Kougeas (1876–1966), persevered in exploring aspects of the "unity and continuity" of Greek history, with emphasis on the restoration and rehabilitation of Byzantium. Most importantly, Paparrigopoulos's scheme of the historical development of the Greek people (invested with moral and Christian overtones) which was designed to forge national consciousness and encourage irredentism, despite its obvious contextuality, still informs central aspects of contemporary cultural and political discourse: occasional idealization of historical figures, educational Hellenocentrism, the rhetoric over the unbroken line from the ancient to the modern Greeks, incidental resort to nationalist doctrines, and romantic historicism to distract from pressing social and economic problems are not uncommon in Greece today. It is not unrelated to the ever-pervasive appeal of Paparrigopoulos that the *History* passed through another edition, this time rendered in modern Greek, in 1983. Interestingly, the historian has lately become a source of constant reference. It is a common practice among social scientists who are searching into the origins of Greek nationalism to reduce Paparrigopoulos to a mere propagandist of the Great Idea whose prejudices fatally flawed his historical understanding. In doing so not only do they underestimate the copious scholarship and ignore the various influences that converge in his work, but they also misinterpret the ideological stance of the *History* as being the *History* itself.

Biography

Born in Constantinople in 1815, Paparrigopoulos fled with his family to Odessa in 1821, then in 1830 they moved to Greece. He did not receive a university education but attended classes given by Georgios Gennadios and published a number of historical works before being appointed Professor of History at the University of Athens in 1851. His five-volume *History of the Greek Nation* appeared in 1864–75. In his last years he was involved in politics and diplomacy. He died in 1891.

Paphos

City in Cyprus

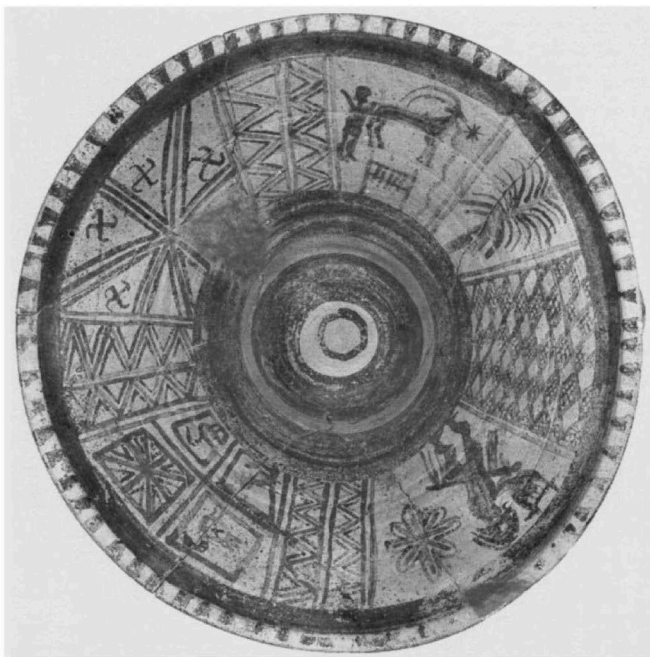
The kingdom of Paphos was already established in the 12th century BC, together with the other kingdoms of Cyprus which flourished mainly in the 1st millennium BC. The site of ancient Paphos (often referred to as Palaipaphos) lies about 15 km southeast of the modern town of Paphos, at a distance of about 1 km from the sea, under the houses of the modern village of Kouklia. In the 1950s the French archaeologist Jean Bérard tried to prove through excavation that ancient Paphos was situated near the northern outskirts of the modern town, but the results were negative.

The site of Old Paphos has been known since the 19th century, mainly because of the remains of the temple of Aphrodite which survived above ground. It was then that the first excavations were carried out, and the first inscriptions from the site of the temple were brought to light which mention the Great Goddess of Cyprus. According to legend the founder of Paphos was Kinyras, representing the indigenous population, but at the end of the Trojan War (soon after 1200 BC) the king of the Arcadians, Agapenor, came to the island with other Arcadians and founded a city of which he became the king. Behind these myths may lie the historical events which are attested by archaeological evidence, namely the beginning of the Achaean colonization of Paphos. Paphos must have been an important urban centre during the 12th century BC. This is reflected by the magnificence of the architectural remains of the temple of Aphrodite and the wealth of the tombs excavated in the Evreti locality which yielded gold jewellery, carved ivory mirror handles, seals, and other artifacts. The Achaeans mingled with the local population and by the 11th century BC, when the process of colonization was completed, there is evidence for the use of the Greek language in the area. On a bronze skewer, found in a tomb of the 11th century BC, there is an engraved inscription with the Greek name Opheltes in the genitive in a form which is peculiar to the Arcadian dialect. Extensive excavations in the early Geometric cemeteries of Old Paphos have brought to light ample evidence for the influence which the Achaeans exercised on the material culture of Paphos (pottery, bronzes, and other objects) as well as on tomb architecture. It should be mentioned here that it is in the tombs of Paphos that there is material evidence for early contact with the Levantine coast, clearly the result of trade which may have been the source of wealth for the Paphians.

Recent archaeological excavations at the site of the temple of Aphrodite have proved beyond any doubt that the original temple was established early in the 12th century BC. It may have been dedicated to a local goddess of fertility, whose worship had a long tradition in the area of Paphos (since the Chalcolithic period). By the time of the Homeric epics, however, the temple is known as the temple of Aphrodite. It was to Paphos, according to Homer, that Aphrodite fled after she had been caught red-handed by her husband Hephaestus in her love affair with Ares. There she had a temple with a fragrant altar (*Odyssey*, 8. 360–66). The temple must have contributed considerably not only to the fame of Paphos as a religious centre throughout the Hellenic world and also the Levantine region, but also to the economic growth of the town. The goddess of Cyprus, Aphrodite, is referred to in Greek literature as Kypris or Paphia. Paphos is comparable to Delphi; the Greek lexicographer Hesychius (1st century AD) refers to Paphos and Delphi as the "omphalos of the earth".

The actual remains of the 12th-century BC temple are too scanty to allow an accurate reconstruction. Based on representations of the temple on seals and coins dating from the Hellenistic and Roman periods, it may be suggested that the original temple consisted of a large courtyard with a perimeter wall constructed of large well-hewn blocks of stone, some of which still survive in situ. There must have been a tripartite structure (as shown in later representations), a holy-of-holies, in the central part of which the sacred aniconic symbol of the goddess, a conical meteoric stone which actually survived, was kept.

The history of Paphos during the early decades of the 1st millennium BC is known mainly from archaeological discoveries in its rich cemeteries. In particular, a tomb of the 8th–7th centuries BC yielded not only rich tomb gifts, but also evidence of special funerary customs, namely the sacrifice of horses with their bronze gear; there were also iron firedogs and skewers, a bronze shield, pottery imported from the Aegean, bronze vessels, and other grave goods. This was not the tomb of an ordinary man. Both the architecture of the tomb and the wealth of the gifts which it contained justify comparison with the "royal" tombs of Salamis, where members of the royal family or prominent citizens, members of the aristocratic elite,



Paphos: interior decoration of a kalathos of the 11th century BC found in a tomb at Xerolimni

were buried. Numerous terracotta votive figurines have been found in the area of the temple of Aphrodite which betray the two cultural traditions to be found in Paphos, and also throughout the island, during the Archaic period, when the island was under the Assyrians: the Greek tradition illustrated by figurines of the goddess with uplifted arms, a type which was introduced from the Aegean in the 11th century BC, and figurines of a Phoenician type.

Assyrian rule over Paphos and the rest of Cyprus is reflected by the so-called prism of the Assyrian king Esarhaddon, which commemorated the reconstruction of the royal palace at Nineveh in 673/72 BC. Ten tribute-paying kings of Cyprus are mentioned, one of whom is "Ituandar, king of Pappa". His name is Greek, Eteandros, which is known also from other inscriptions. Other kings of Paphos with Greek names are also known from inscriptions of the 6th century BC, namely Stasis and his son Onasicharis.

Paphos suffered the same political fate as the other cities of Cyprus. After the Assyrians, the Egyptians ruled Cyprus for a while (669–545 BC). In 545 the kings of Cyprus submitted voluntarily to Cyrus, king of Persia, whose rule was ruthless. Paphos took part in the Ionian revolt against the Persians, together with the other cities of Cyprus, in 499. The Persian army besieged Paphos and a fierce battle was fought outside the northeast gate of the city. Archaeological excavation revealed some dramatic moments of this siege. The Persians built a mound outside the gate to reach the height of the city walls, but the besieged undermined it with countersiege works. To build the siege mound the Persians used stones and sculptures pillaged from a nearby Archaic sanctuary. The sculptures include fine heads of limestone, some of them illustrating Egyptianizing stylistic trends, but other sculptures such as a marble winged sphinx betray the influence of Greek art. Mention should be made of the discovery of a Greek bronze helmet, no doubt belonging to a Greek soldier who defended the city against the Persians. Paphos, together with the other cities of Cyprus, fell under the Persian yoke once more.

The names of several kings of Paphos of the Classical period are known from their coinage. One of the best known is king Nikokles. He seems to have objected to the lust of the cult of Aphrodite, and introduced to Paphos the cult of Hera, the goddess of family life. Finally, in about 320 BC, he transferred his throne from Palaepaphos to Nea Paphos, about 15 km to the northwest, near the coast, where he built a temple to Artemis Agrotera, demonstrating again his feelings against the cult of Aphrodite. Nikokles was responsible for the building of a harbour and the defences of the new city, remnants of which have been uncovered in recent years, in the western part of the city, with monumental gates and ramparts. The vertical rock face provided adequate protection against possible attacks from the seaward side.

Nea Paphos flourished under the Ptolemies. In the 1st century BC they transferred the seat of government from Salamis to Nea Paphos, which was more easily accessible from Alexandria. The mint of Paphos was quite important during the Ptolemaic period, as is illustrated by a hoard of 2484 silver tetradrachms found during recent excavations. Several Greek gods were worshipped at Nea Paphos including Zeus Polieus, Leto, Apollo Hylates, Artemis, Aphrodite, and Hera. The city had a gymnasium and a theatre. A playwright of the 3rd century BC who was a native of Paphos is known by name, Sopatros. Among the political-religious institutions of Paphos, the "Koinon Kyprion" (the confederation of the Cypriots) aimed at the promotion of the ruler cult. The city must have had monumental buildings, but none of these has survived. The splendour of the rock-cut "tombs of the kings", imitating those of Alexandria, echoes the importance of the Ptolemaic city.

Palaepaphos, with its temple of Aphrodite, continued as a religious centre during the Hellenistic and Roman periods, but its economy declined considerably, having lost the status of capital of the region.

The Romans favoured Paphos to a considerable extent and they retained it as their capital and as the headquarters of the Roman garrison. Culturally, however, as in the rest of Cyprus, the Hellenistic civilizations lingered on. The spacious and luxurious villas with their polychrome mosaics, which have been uncovered during recent excavations, illustrate the importance of Roman Paphos. In the Acts of the Apostles it is mentioned that St Paul and St Barnabas preached Christianity in Paphos, and Sergius Paulus, the governor of Paphos, was converted to Christianity in AD 45.

The repeated earthquakes of the 4th century AD destroyed the splendid buildings of the city, although some of them were repaired and continued to be used down to the 5th century. Christianity prevailed completely by the 4th century, in spite of some efforts to revive the old pagan religion. Paphos regained part of its old splendour during the early Christian period.

VASSOS KARAGEORGHIS

Summary

A city in southwest Cyprus, Paphos flourished mainly in the 1st millennium BC. It was an important centre in the 12th century BC when Achaean colonization began and the temple of Aphrodite was established. Greek culture mixed with Assyrian in the Archaic period,

followed by periods of Egyptian and Persian rule. New Paphos flourished under the Ptolemies and became the island's seat of government, while Old Paphos declined.

Papyrus, parchment, and paper

Stone, metal, clay, pottery, wood, wax, and other materials were all used as writing materials from an early date, but it was the lightness and convenience of papyrus, parchment, and paper that made writing a portable and accessible activity.

Evidence for the use of papyrus (from which we get our modern word paper) dates from the 3rd millennium BC in Egypt, and it was used in Greece from at least the end of the 6th century BC, as proved by its depictions on pots. An early Greek word for papyrus, *byblos*, may indicate that it came to Greece from Phoenician Byblos at the same time that the Greeks obtained their alphabet in the 8th century.

The papyrus plant, although cultivated in Palestine and Sicily in antiquity, was native to Egypt, where it was produced commercially for purposes as varied as material for boats, for sandals, and, of course, for writing. The primary production area was the lower Nile and delta, probably giving rise to Alexandria as its principal distribution centre later. Pliny (*Naturalis Historia*, 13. 74–78) provides the most extensive, if sometimes faulty, description for the manufacture of papyrus sheets in antiquity. The triangular-sectioned stalk was sliced into strips *c.*30–40 cm long, the centre pith providing the most prized grade of material, the outer strips the least prized. Strips of similar quality were set parallel to each other on a flat surface; a second layer was then placed at right angles on top and the two layers were pressed to release the natural gluten in the papyrus, which served as the bonding agent for the dried sheet. After drying, the sheets were smoothed with a smooth stone or shell before being attached to other sheets with a wheat paste and vinegar (probably to kill mould) by overlapping sheets by 1–2 cm. For writing from the left, the left sheet overlapped; for writing from the right, the right sheet overlapped. Individual sheets might be used for accounts and records, but literary works often used about 20 sheets in a book roll *c.*6–8 m long by 0.11–0.24 m wide. Customized rolls of different dimensions have produced examples more than 40 m long but customers generally bought a "regular" book roll and then cut or added according to need. One of these rolls would accommodate a dramatic text of *c.*1500 lines, two books of Homer, or one book of a prose writer such as Thucydides.

Most often the inside of the roll had the horizontal strips of papyrus. This helped to reduce the strain caused by rolling and unrolling but, more importantly, the horizontal grain aided writing and became the primary writing surface. The outside, composed of the vertical strips of papyrus, was not regularly employed as a writing surface although many exceptions exist. In addition, since the inks applied by reed pens were water soluble, the writing on the surfaces of both papyrus and parchment was often sponged or rubbed off and then reused (as a palimpsest). In order to protect the papyrus when rolled up, the first sheet, called the protocol (*protocollon*), was often attached at right angles to the grain of the next one. Occasionally parchment was used to reinforce the vulnerable sheet and the roll was wound around a cylinder to help protect it. Cedar oil was used to repel worms.

A variety of animal skins also served as writing materials. Two processes were used to procure a suitable surface although the initial stage was the same: the skin of the freshly slaughtered animal was temporarily cured to inhibit decay, allowing later processing, or the skin was immersed in a solution to help loosen flesh and hair, which were then removed. At this point the processes diverged. Hides steeped in tannins produced durable and flexible leathers. In the second process, hides were first slaked in lime and then rubbed with calcium oxide. Next they were stretched on a frame and gently air-dried in an environment that maintained a moderate temperature. At that point the hides were removed from the frames and smoothed with pumice or chalk to increase their whiteness. The final product, which might also be thinned by shaving, was parchment (goat or sheep) or vellum (kid or calf). The stiff and durable material was then cut into sheets and sewn into rolls with hair-sides on one surface and flesh-sides on the other. Later, in the 1st century AD, both parchment and papyrus were bound into codices (see below).

Papyrus was the favoured material throughout antiquity, even though hides were used as writing surfaces in Asia Minor from the beginning of the 1st millennium BC and in Greece probably from the 6th century at least. The theory that papyrus was eventually surpassed by parchment and paper since they have a better surface and are lighter in colour is not true. Pliny's (*Naturalis Historia*, 13. 21) statement that parchment was invented at Pergamum (*pergamena* is its name in Latin and Greek) also seems unlikely, but its surge in popularity probably arose in the first half of the 2nd century BC when problems with papyrus supply from Egypt gave the Pergamene rulers the opportunity to increase its prominence and distribution. During the Middle Ages parchment, even though more expensive, became the prized writing material largely as a result of its durability and wide availability, which was not governed by geographical restrictions and climate. Its use for liturgical purposes and then for legal and medical documents

contributed to its success. Not until the 12th century did parchment begin to lose its position as the pre-eminent writing material, when the Moors introduced into Spain rag paper, an invention of ancient China that had steadily gained in popularity from the beginning of the 2nd century AD.

Book rolls were the most common medium for both papyrus and parchment throughout most of Greek and Roman antiquity. Wood tablets and hollowed wood tablets containing wax inserts, upon which accounts and temporary texts and exercises could be scratched or chalked, were joined together by a clasp or leather thong through holes and used as a type of notebook as early as the beginning of the 1st millennium BC in the Middle East and certainly by the early 5th century BC in Greece. The book roll, however, remained the preferred medium for longer, permanent texts. By the 1st century AD papyrus sheets and folded sheets of parchment began to replace the ungainly wood tablets. This produced a less cumbersome notebook that eventually, in its most common form, consisted of quires (gatherings) of four wide sheets of parchment folded along the vertical axis and sewn along the fold. The resulting codex (book) had eight leaves (folios) making sixteen pages, which were bound within a sturdy covering.

The new medium, however, did not win immediate acceptance among a seemingly conservative writing community. Doctors and astrologers may have promoted the use of such notebooks, but the acceptance and eventual domination of the codex over the ubiquitous book roll has been plausibly attributed to the newly emerging Christian religion. The codex provided a format that was clearly superior for recording and recovering information, and was convenient to carry, especially in contrast to the incredibly cumbersome book roll. For the first time it was possible to examine texts quickly and efficiently. The distinct format of the codex may also have been attractive to the new religion, which sought to set itself apart from the book roll of Jewish and pagan tradition.

From the 2nd century AD Christianity regularly employed the codex to record the Old Testament, New Testament, and Apocrypha. This use in conjunction with the growth of Christianity itself led directly to the acceptance of the codex as the standard format for the written word. Early Christian codices are all very utilitarian, but by the 4th century elegant volumes were being produced that contained elements foreshadowing medieval book illustration.

After the advent of writing, the innovation of the codex represents perhaps the most important advance to promote learning. Now real research could be recorded easily and efficiently.

Parmenides *c.*515–*c.*440 BC

Philosopher

Parmenides was a Presocratic philosopher who lived in the southern Italian town of Elea (near the modern town of Agropoli). He was the first of a group of philosophers who are called Eleatics, the others being Zeno and Melissus. Parmenides also appears as a character in Plato's work *Parmenides* and is the probable inspiration for the character of the Eleatic Stranger in the same author's *Sophist* and *Politicus*, written a century after his death.

In the ancient world Parmenides and his successors were celebrated as opponents of the possibility of change. Just as Heraclitus was supposed to maintain, as a basic proposition, that everything is in constant change, so Parmenides and the

Eleatics were held to be committed to the denial of the possibility of any change. But as with Heraclitus, this characterization somewhat distorts the emphasis and focus of their concerns. It is more accurate to construe these philosophers as early metaphysicians. Their concern lay with the nature of what there is and what is real. Change comes into the discussion through this motivating interest.

Parmenides' words are preserved for us through extensive quotations in Simplicius, writing some 1000 years later in the 6th century AD. His work is a poem which, after a hieratic introduction invoking divine assistance, contains two notably contrasting parts. In the first part he expounds the truth, while in the second he relays the erroneous opinions of unenlightened speculators. In the Way of Truth (as it is often called) he argues that if something can be spoken and thought about, it must exist; nothing is not a possible subject for investigation. "You cannot say or think what is not there", is his controlling refrain. Any possible subject for investigation, *is*.

As the argument advances, he establishes further facts about this existent subject: it is without beginning or end, single, whole, and invariant. Parmenides establishes each of these conclusions on the same basis as his original argument: the position that he will endorse commends itself because it enables him to avoid thinking or talking about nothing. As the author of this ongoing argument, he insistently reminds us of the conditions for any rational communication. He concludes this part of his argument by comparing his subject to "a well-rounded sphere, everywhere equally balanced from the centre".

Parmenides then passes to an account of a less enlightened way of thinking, which he declares to be thoroughly false but still wishes to expound. This account differs from the Truth in being comprehensively dualistic. Opposing pairs – such as Night and Day – are admitted into the scheme of things, rather than the introduction of the one requiring the exclusion of the other. Yet even here the method of argument is resolutely hard-headed and rationalistic, bearing the stamp of the author of the Truth.

Was Parmenides' Way of Truth meant to be an account of the physical universe or of some quite different order of reality, or of some monadic element in either of these schemes? Some would regard the question as quite anachronistic, and certainly any detailed answer to it is underdetermined by his own words. His argument points in the direction of every one of these philosophical developments, while not favouring or excluding any of them. The comparison of reality to a sphere may indicate spatial extension but it need not.

Parmenides' originality and achievement consist in four points. First, he introduced questions concerning existence into the explicit agenda of philosophy; he is the father of ontology. Secondly, he grounded this ontological discussion in the conditions for successful talk and thought. This is a feature of method that he shares with Heraclitus; both philosophers thus deserve the credit for first raising issues in epistemology. But in Parmenides the control exercised by considerations of language is paramount. He is the first philosopher of language. Thirdly, he expounded profound paradoxes about the possibility of change; thereafter no philosopher could assume that change was an unproblematic phenomenon. Finally he was the first philosopher to use argument. He advances from one statement to another with the armoury of "therefore" and "since". According to some current conceptions of philosophy, this last feature of his work would suffice to establish him as the first philosopher.

Parmenides and his immediate Eleatic successors bequeathed a powerful agenda of problems to subsequent Greek philosophers. The sophists of the following generation of 5th-century BC philosophers included Gorgias, who wrote a nihilistic essay in the Eleatic style *On What There Is Not*. These thinkers also developed epistemological paradoxes of change – for example, that learning and enquiry are impossible because there is no intelligible way for someone to advance from a condition of ignorance to one of knowledge. This is a version of the paradox of enquiry, first adumbrated in Plato's *Meno*. In later works, notably *Sophist*, Plato confronts the central Parmenidean claim that *what is not* is unintelligible and undiscussable. His highly original analysis of this issue turns on securing a sense for "not" according to which it means "other than".

Aristotle's philosophy is greatly influenced by Parmenides, even though the influence appears to be negative. In his own ontology, the ability to bring about and undergo change is a deeply important fact about most things that exist; and his programme of philosophical enquiry is organized accordingly. Therefore he regards Parmenides, with his utter rejection of the significance of change for natural substances, as a wrong-headed maverick. But he is compelled to give an account of change that removes from it any air of paradox. Aristotle achieves this with analyses that involve his novel concepts of potentiality and actuality and of matter and form. The motivation for these influential doctrines is a desire to show that change, so far from being mysterious as Parmenides had argued, is intimately bound up with the nature of everyday substances.

Aristotle's anti-Eleatic polemic was in part directed against certain contemporary philosophers, sometimes known as "Megarians". These included Eubulides, Philo, and Diodorus Cronus, who were interested in modal logic. Their interest in rigorous argument, and their paradoxical theories about possibility and necessity, bear the stamp of Parmenides.

From this point on Parmenides' direct influence wanes; but his philosophical personality looms large as philosophers from Kant onwards have pondered the idea that there are – or may be – limits to what can enter the scope of rational enquiry and discussion. Are there truths that transcend human powers of ratiocination? Parmenides in effect replied "no" to this question; and even those philosophers who are inclined to reply otherwise, must acknowledge the posing of this fundamental philosophical question as Parmenides' greatest legacy.

J.D.G. EVANS

Biography

Born in Elea in southern Italy *c.*515 BC, Parmenides was the first of a group of philosophers known as the Eleatics. He was the first philosopher of language. He is said to have visited Athens when aged 65. He appears as a character in Plato's *Parmenides*. He wrote a philosophical poem which survives only through quotations in Simplicius (6th century AD). He died *c.*440 BC.

Parren, Callirrhoe 1859–1940

Feminist and journalist

Born to Stylianos and Sophia Siganos, in Platania Amariou Rethymnis, Crete, on 1 May 1859, Callirrhoe qualified as a teacher in 1878 and taught in schools in the Greek communities of Odessa and Adrianople. Back in Athens, she married, in 1886, the Constantinople reporter Ioannis Parren who was for years director of the Athens News Agency. Having observed the low intellectual level of women around her and their superficial and purposeless lives, especially when they had no children, Parren dreamed of working to raise women's level of awareness as social agents and in their role as mothers in the newly emerging modern Greek nation. With the encouragement of her husband, Parren published the first women's newspaper, on 8 March 1887, thus introducing female reportage to Greece. Through the *Ephimeris ton Kyrion* (Ladies' Newspaper, 1887–1917), Parren was soon established as one of the leading intellectuals of the country involved in the cultural discussions of the time. Through the pages of her weekly, Parren promoted women's issues and confronted governments with women's rights to education and equal employment opportunities. She soon had a number of talented women contributing to the paper which became a forum for the literary expression of women as well as a thesaurus of information on home economy, health, beauty, child rearing, world news, especially matters relating to the feminist movement and women's achievements in developed countries. Parren began receiving invitations to represent Greek women at international congresses of women (Paris 1889, London 1899, Chicago 1893, etc.).

Her desire to see her country a better place turned her into a social activist. Besides women's issues, her weekly articles addressed all the needs of Greek society and forced the government to pass appropriate bills. She mobilized women and organized fundraisers, often recruiting the support of the queen and the princesses of Greece, to redress social injustice, for which she was later decorated with the Silver Cross of the Phoenix (1921), the Silver Medal of the Academy of Athens (1936), and the Gold Cross of the Phoenix (1936). Her activities ranged from founding institutions – such as Sunday Schools for Poor Women and Girls (1890); Women's Hospital for Incurable Diseases (1892); St Catherine's Asylum (1893), offering needy working girls and unmarried mothers accommodation and support; the Children's Asylum, a day-care centre (1896); the Association for the Protection of Animals (1896); St Sophia Children's Hospital (1896); The Epheveion (adolescent penitentiary) in the Averof Prison (1896), furnished with full grade-school and hospital – to making the government take protective measures such as banning the employment of under-age children and night shifts for children and women in factories, and to consider hiring women as state employees; and to pressing the University of Athens to open its doors to women in 1891 and the Polytechnic School in 1896. The causes to which Parren applied her social agenda were endless, her main goal always being to empower women, enforce social justice, and raise the awareness of Greek society to offering women equal opportunities. After her return from the Chicago World Congress of Representative Women, she founded the Association of Greek Women in 1896, offered relief to the refugees of the 1896 Cretan uprising. During the Graeco-Turkish War (1897) it organized surgical units at the front, directed and operated solely by women, and came to the succour of war widows and orphans. Parren is also remembered for founding the Lyceum of Greek Women (1911) whose purpose is the preservation of folk music, dances, and costumes from all over the country.

While promoting her social agenda, Parren realized that without the vote women had no real power to effect changes through legislation. Thus, although at the beginning she did not demand suffrage for women, in 1894 she presented prime minister Charilaos Trikoupis with a suffrage petition carrying thousands of women's signatures. She repeated the demand during the premierships of Theodoros Deliyannis (1897) and Demetrios Gounaris (1921). Although they received the petition favourably, none dared propose a women's suffrage bill. It was only in April 1949, and under pressure from the United Nations Charter, that women over 21 were granted the right to elect and be elected in municipal elections. In a 1952 amendment to the Constitution women were granted the vote in general elections, a right which they exercised for the first time in 1954.

Among her other activities, Parren adopted literary discourse as a means to promote her feminist and social agenda. All her novels are deeply enmeshed in the ongoing cultural debate about women and the changing concept of women's roles in the developing Greek society. Her first three novels – *I Cheiraphetimeni* (The Emancipated, 1900), *I Magissa* (The Sorceress, 1901), and *To Neon Symvolaion* (The New Contract, 1903) – comprise a trilogy under the title *Ta Vivlia tis Avgis* (The Books of Dawn) and refer to Parren's vision of a new era of equality and justice between the sexes, in which men and women, having had equal opportunities in education and the workplace, would develop responsible and honest characters which would lead to relationships of equality and happy lives together. At the same time, the three novels illustrate Greek society's vision of the messianic role women were expected to play in the regeneration of the nation in their role as mothers who would raise a generation of Greeks with a strong sense of national identity and ready to sacrifice themselves for their country. Parren also wrote *Choris Onoma* (Without a Name, 1905–06), *To Marameno Krino* (The Withered Lily, 1907–10), and *To Aspro Triantaphyllo* (The

White Rose, 1915–17), all serialized in her weekly. And she wrote plays: *I Nea Gynaika* (The New Woman, 1908), based on *Ta Vivlia tis Avgis* and performed in 1907, was the third of a trilogy of plays she intended to write in order to delineate the evolution of Greek woman from Homeric times to the present. *Penelope* and *Aspasia* would be representations of the perfect woman of Homeric and historical times but no manuscripts of these plays have been discovered so far. Consistent with her goal to raise Greek women's educational level, Parren researched and began to write but never completed the *Istoria tis Gynaikos* (History of Women, 1889) in three volumes: *Ai Gynaikes tis Proistorikis Epochis* (Women of Prehistoric Times); *Ai Gynaikes ton Indon kai tis Kinas* (Women of India and China); and *Ai Ellinides apo tou 1508 mechri Simerou* (Greek Women from 1508 to the Present). From the diaries of her travels, only *Ta Taxidia mou: Souidia* (My Travels: Sweden) was published. Accounts of her other trips appeared in the *Ephimeris ton Kyrion*.

Parren was admired and supported by men such as Gregorios Xenopoulos and Kostis Palamas who dedicated poem 95 from "Ekato Phones" (A Hundred Voices) in *I Asalevti Zoi* (Still Life) to her, the finest representative of "the new woman", capable of elevating man's world and human society. When Parren died on 16 January 1940, she was granted a state funeral. In 1991, the City of Athens offered a plot in the principal cemetery in Athens where Parren's bust, made by the well-known Greek sculptor Costas Valsamis, was erected. On this spot a memorial service for Parren has been held on International Women's Day every year since 1992. Her legacy, which was dimmed by the two World Wars, was reclaimed in the late 1970s and her literary works, forgotten for almost a century, are now being studied and reprinted.

MARIA ANASTASOPOULOU

Biography

Born in Crete in 1859, Parren qualified as a teacher and taught in schools in Odessa and Adrianople. In 1886 she married the journalist Ioannis Parren. She founded and edited the *Ephimeris ton Kyrion* (Ladies' Newspaper, 1887–1917), wrote novels and plays, and made Greece aware of women's issues. She died in 1940 and was granted a state funeral.

Parthians

The Parthians were originally the people who lived in the Achaemenid province of Parthia, (Parthava in Old Persian), which comprised the region of Chorasan in northeastern Iran and of southern Turkmenistan. The Parthians later came to be identified as the people of the Parthian empire, founded by the Parni, a nomadic people, who entered Parthia from the north-east in the mid-3rd century BC and adopted the name "Parthians" for themselves. Through gradual expansion the Parni / Parthians built an empire, which lasted for almost 500 years, from 246 or 238 BC to AD 224, and which stretched from the Euphrates to the Indus. Until the Parthians revolted against the Seleucid empire, Parthia remained a satrapy; during the reign of Antiochus III (223–187 BC) the Parthians were still regarded as vassals. Early Parthian coins bear a Greek legend and show that the Parthian kings did not always use a royal title; by the middle of the 1st century BC Parthian script was used and kings had adopted the Achaemenid royal title of "king of kings".

The expansion of Parthia from kingdom to empire was a gradual process which lasted over 100 years. After the death of Antiochus III in 187 BC, Parthian troops under Phraates I (176–171 BC) began campaigns against the mountain people north of the Elburz mountains, followed by campaigns south of the Elburz, led by his successors. Territorial conquest on a large scale was undertaken by Mithridates I (171–139/38 BC), who first secured the eastern lands for the empire, Bactrian territory in 160 BC, and eastern Iran in 150/145 BC. During the 140s BC Media was conquered and the Seleucids were driven out of Iran, allowing Mithridates to campaign against Babylonia and Elymais. With Adiabene, Gordyene, and Osrhoene, in northern Mesopotamia, as client kingdoms, and control of Dura-Europus won in 113 BC, the long period of Parthian conquest and expansion was completed.

The Parthians were ruled by the Arsacid dynasty, named after the founder of the empire, Arsaces I (*c.*248/238–217 BC). First establishing their power in the cities of Hecatompylos and Nisa, the Parthian kings then centred their power in Ctesiphon and Vologesocerta. The Parthian nobility was headed by the royal councillors (*ordo probulorum*), followed by the Parthian aristocracy (*pelatai*), the *douloi* (servants), and possibly a slave population. Organized in *regna*, client kingdoms of the Parthian king, which paid tribute and provided military service, the empire comprised a multitude of peoples who spoke different languages and dialects. Parthian became the administrative language of the empire, though other languages, such as Greek, Aramaic, Middle Persian, and Sogdian, were

also used. Parthian culture shows distinctive features in art and architecture, most notably the vaulted *iwan* halls and the planning of cities and fortresses.

Parthian influence on the Classical world increased after 20 BC, with the establishment of diplomatic relations between Augustus and the Parthian king Phraates IV (38–3/2 BC). Phraates IV returned the standards taken from Crassus (54/53 BC), Decidius Saxa (40 BC), and Antony (36 BC), while Rome acknowledged the Euphrates as the border between the two empires, and returned Phraates' son to the Armenian throne. The diplomatic treaty marked Roman recognition of the Parthian empire, but Roman propaganda manipulated the event into a public demonstration of Roman superiority over the Parthians, expressed in literature and art. Parthia was considered to be yet another vast, oriental – and therefore inferior – empire, which Rome made little effort to understand.

In literature, the Parthians were stereotyped as cruel, uncivilized barbarians. They were on a par with the Scythians, and with the decadent Persians of the past, being interchangeably referred to as Medes, Persians, or Achaemenids. Roman art after 20 BC shows a preoccupation with the depictions of Parthians as typical barbarians. The statue of Augustus of Prima Porta, dated to 17 BC, prominently displays a Parthian on Augustus's breastplate, "offering" the Roman standards. Parthians were represented as kneeling subjects, as in the case of a huge bronze tripod, or standing as supporting figures in architectural designs. Bronze ornaments representing mounted or dead barbarians in Parthian dress were mass-produced. Statues of Parthian barbarians, first seen at the Basilica Aemilia in the Roman Forum, were sculpted from coloured marble, *marmor Phrygium* or *marmor Numidicum*, symbolizing oriental luxury and colour. Their un-Roman build and stature identified the Parthians as people who were not part of the civilized world of the *orbis Romanus*, but of the *orbis alter*. A Parthian arc was built after 20 BC, depicted on gold and silver coins. Trajan celebrated his shortlived victory over the Parthians with an *aureus*, describing himself as Rex Parthus, and a coin, bearing the legend "Parthia Capta", depicted two barbarians huddled together in front of a *tropaeum*. Blurring the distinction between Persians and Parthians, Roman emperors sought to compare the Greek–Persian wars of 490 BC and 480/79 BC with Rome's fight against Parthia, in an effort to legitimize Roman ambition to conquer Parthia. The restaging of the battle of Salamis in a vast *naumachia* (ship battle) by the Tiber in 2 BC to celebrate the opening of the temple of Mars Ultor was one of a number of public demonstrations hinting at the Greek–Persian wars, but implying Rome's fight against Parthia. According to Roman ideology, the Parthians were an eastern, barbarian power steeped in oriental luxury, military aggressors who threatened the western world. Roman propaganda was to demonstrate that Rome was dealing with defeated barbarians, not with a political and military power that was equal to Rome. The Romans upheld this view throughout the existence of the Parthian empire and then imposed it on the Parthians' successors, the Sassanians. The Sassanians, for their part, rigorously tried to erase Parthian culture, and it remained largely forgotten until the late 19th and 20th centuries when excavations began in the Near East and the past of the Persian empires was revived. First excavations at Nisa, undertaken by Russian scholars between 1948 and 1961, began to unearth archaeological evidence of the Parthian period, from which emerges, and continues to emerge, a picture of the Parthian empire independent of hostile Greek and Roman sources.

MARIA BROSIUS

Summary

Originally denoting the inhabitants of the Achaemenid province of Parthia, "Parthians" came to mean the people of the Parthian empire which lasted from 246 or 238 BC to AD 224 and stretched from the Euphrates to the Indus. For the Romans the Parthians were the stereotype of cruel, uncivilized barbarians. Recent excavation shows them in a different light.

Pastoralism

Pastoralism, that is to say the phenomenon of animal husbandry, has tended to go hand in hand to a greater or lesser degree with an agrarian economy. Pastoralism can be linked to a farming economy or, at the other end of the scale, be associated with transhumance, the seasonal movement of flocks from one area to another. Pastoralist communities would have a high reliance on domesticated animals for their livelihood.

The first evidence for sheep and goats on Crete as well as mainland Greece comes in the early Neolithic period, that is to say the late 7th millennium BC. Evidence for pastoralism on Crete in the Bronze Age has been presented by excavation of the Early Minoan II site of Myrtos. Some 90 per cent of the animal bones were from ovicaprids, and the excavation suggested that the wool was being processed in individual homes. Indeed it has been suggested that the settlement of Myrtos was possibly seasonal. Also from Crete come some models of sheep from inside a Middle Minoan I bowl found at Palaikastro.

Pastoralism in Arcadia is reflected by the appearance of small bronze dedications during the 6th century BC. These can show shepherds wearing a distinctive conical hat, sometimes

wearing a cloak and boots. Often the shepherds carry a sheep or ram under their arms, though one from Mount Lykeios had a small calf on his shoulders. One figure, now in the Metropolitan Museum of Art, New York and said to have been found near Andritsaina, carries an inscription, "Phauleas dedicated [this] to Pan". Many of these Arcadian figures were probably dedicated in the sanctuary of Zeus Lykaios or the sanctuary of Pan (described by Pausanias, 8. 38. 5). Such types are similar to the now lost dedication made by the Arcadians of Pheneus who commissioned a statue of Hermes by the Archaic sculptors Onatas of Aegina and Calliteles (Pausanias, 5. 27. 8). Pausanias described a statue of the god "in a tunic and a cloak with a peasant's cap on his head and carrying a ram under his arm". Such dedications may suggest specialized pastoral communities. On the island of Rhodes in the Classical period one of the social groups was called a *sunnoma* which suggests that the members had a common right of pasture.

Evidence for pastoralism appears in the faunal material from excavations at Greek sanctuaries. Sheep and goats appear to have been favoured for sacrificial victims at many sanctuaries. Ethnographic evidence shows that culling of flocks can take place in the early summer before there is a lack of suitable pasture for large flocks, or for younger animals in the spring. If pastoralism is geared to the production of milk, then males and ewes which have stopped lactating are likely culling victims.

Pastoralism can also be detected in the epigraphic record. For example, in the 5th and 4th centuries BC the Attic demes of Marathon, Thorikos, and Archia were sacrificing a number of wethers or ewes in their festivals. Such evidence for flocks makes up for the limited information for Attica available from literary sources. One such example may be the 4th-century BC legal case where sheep – the flock consisted of some 50 animals – were seized from a farm not far from the hippodrome (Demosthenes, 47. 52–53). A male lamb was sacrificed in the early summer on Mount Hymettos in Attica in the cult of Zeus Epakrios, presumably to coincide with the use of the higher winter pasture.

Pastoralism also makes its appearance in literary sources. For example, at the start of the *Theogony*, Hesiod was taught to sing as he tended flocks on Mount Helicon. Clearly the agricultural economy of Askra, so well known from the *Works and Days*, included a pastoral dimension; it should be noted that its pastures are only some 5 km from the lower slopes of Helicon. Aristotle (*Politics*, 1319a.19–23) noted pastoral communities as one of the best forms of democracy (after arable farmers). A more detailed account of sheep can be obtained from the Hellenistic writer Aeschylides (and recorded in Aelian, *On the Characteristics of Animals*, 16. 32), who noted that on the island of Ceos sheep were fed with the by-products of agriculture, such as fig leaves, olive leaves, and husks from pulses, to save on the poor pasture. Such reliance on agricultural products would keep the flocks close to the communities. The converse of this was that the flocks themselves were a ready source of dung which could be used to enhance the productivity of the cultivated plots and fields. However, one reason for the low profile of pastoralism in ancient sources is that shepherding was probably a humble occupation compared to that of arable farming.

The evidence from inscriptions and to a lesser extent literary sources suggests that flocks were usually owned by members of the social elite. For example, one of the mutilators of the herms in 415 BC at Athens had 84 sheep and 67 goats among his confiscated property. The flocks themselves appear to have been cared for by individuals of much lower status, sometimes slaves. Although there are some dedications known from herdsmen, they may have been hired.

One feature of pastoralism is the movement of flocks from summer to winter pasturage, transhumance. This may involve moving flocks from the summer pastures in the mountains to lower areas, sometimes over long distances. There are two main types: the first where the shepherds are drawn from lowland communities, but use the mountains for pasture in the summer; the second, so-called "inverse" transhumance, where the shepherds are themselves mountain dwellers, and only come to lower areas in winter or for markets. In recent centuries transhumance may involve the movement of whole communities, requiring winter and summer settlements. In medieval Crete the main community was often considered the winter one, often situated at less than 200 m, but by the mid-19th century the reverse was true with communities choosing to make the summer settlement their main centre. An ancient example detected in the literary sources is Sophocles' mention of the Theban and Corinthian shepherds on Mount Cithaeron in the story of Oedipus (*Oedipus Rex*, 1132ff.). However, such transhumance was over short distances; such pastures on Cithaeron lie only some 20 km from Thebes, and 30 km from the Corinthia. This can be contrasted with modern transhumance in the northern Peloponnese which might cover some 100 km. Another ancient example comes from the late 1st century AD on the island of Euboea where Dio Chrysostom (*Orations*, 7. 11–15) mentioned flocks and herds of cattle. Evidence from ancient border disputes suggests that such long-distance transhumance was unlikely.

Border disputes between neighbouring poleis could sometimes hinge on grazing rights. One such dispute in the 2nd century BC, marked by inscriptions giving details of the agreement, was between Epidaurus and Hermion in the southern Argolid. The text of the agreement indicates that pasturage was one of the issues at stake, along with cropping. The agreement records that there had already been a decision "concerning the payment of fees to tax collectors for the pasturage of goats". The border area in question was clearly delineated in the agreement, and on the ground it corresponds to an area of some 30 sq km with land rising to nearly 800 m. It may have been used for winter grazing, although it has been observed that in recent times the same area is traversed by transhumant shepherds taking flocks between Arcadia (Valtetsiotes) and the southern Argolid. Such recent patterns in Greece are thought to have been dependent on the landholding patterns developed during the Tourkokratia. The southern Argolid was thought to be a particularly attractive area for flocks, as there were ready markets on the offshore islands of Hydra, Spetsae, and Poros.

The number of goats using such land is hard to estimate, if only because other areas of grazing land would probably have been in use, but it has been suggested that something like ten herds each of 200 goats would not be unreasonable. If such numbers were using this area, it was clearly profitable to tax the land's use. A hint at the profits from such activity is

Pastoralism: shepherds pen goats for dawn milking near Paleokerasia, central Greece

revealed by a dedication made in one of the sanctuaries of the polis of Epidaurus by one Timainetos in the mid-4th century BC. Timainetos made an offering to the Dioscuri as "a tithe from the goats". Although Timainetos may have been one of the tax collectors, he is more likely to have been an owner.

Such disputes in the Argolid over such marginal territory were not unknown. Epidaurus had been in two further separate disputes with its neighbours, Corinth and Arsinoë (the renamed polis of Methana). It is perhaps significant that at the polis of Troizen in 146 BC there was a group of resident Arcadians. It has been plausibly argued that it was this group of individuals, who had been drawn to, and settled in, the marginal areas of the poleis of the southern Argolid, that was causing the tensions.

Such tensions may reflect the reasons for the 2nd-century BC boundary dispute between Delphi and its neighbour Ambryssos. The boundary between the two cuts across modern transhumance routes, and there is a possibility that grazing rights lay behind the ancient dispute. Such disputes emphasize the general view that mountain regions were considered to be the property of those dwelling in urban communities even though the majority of people chose not to dwell there.

The problem of neighbouring communities seizing flocks may explain the reason for the building of extensive walls for some cities in the Peloponnese. It has been argued, partly on the basis of Polybius' account of a raid on Messene in the 220s BC (4. 3. 8–4. 1), that one of the reasons for its new wall system in the 4th century was to serve as protection for flocks.

There seem to have been restrictions on grazing on land owned by some of the sanctuaries. For example, the inscription from Arkesine on Amorgos relates to some land which was the property of the sanctuary of Zeus and which restricted the pasturing of animals. A 4th-century inscription from Chios restricts pasturing and the spreading of dung on what must be considered sacred land. However, estates belonging to the temple of Delian Apollo on the islands of Delos and Mykonos included grazing land.

Grazing could be the prerogative of citizens who were given specific rights of pasture; such was the case at Tegea in Arcadia. Such rights could then be bestowed on specific individuals for services to the community. In the 1st century AD the citizens of Methana in the Argolid granted grazing rights to a resident of Corinth, L. Licinnius Anteros, in return for his acting on their behalf as *proxenos* ("consul") in the centre of Roman administration in the province. Such honours may in fact have become meaningless during the Hellenistic period, as sometimes they were bestowed on individuals who dwelt so far from the grazing areas that they are unlikely ever to have been in a position to take up the rights. In Hellenistic Boeotia the cities of Akraiphia, Kopai, and Orchomenus granted grazing rights on water meadows around Lake Copais as repayment for unpaid loans.

Pastoralism in Greece today is very different from what it is likely to have been like in antiquity. Rather than being linked to subsistence economies, flocks are intended to generate cash income. On contemporary Crete flocks can consist of some

400 sheep which require the care of two or three men. Flocks in antiquity are likely to have been used to produce wool and dairy products – sheep cheese from Ceos apparently sold for 90 drachmas a talent in the Hellenistic period – as well as meat. Traditional transhumant patterns are being disrupted. For example, the Sarakatsans of northwestern Greece used to exploit the plains around Ioannina until settlers from Turkey took over in 1927. Subsequently, the Sarakatsans have looked to large urban populations such as Athens for their markets.

Patmos

Island in the Dodecanese

The small island of Patmos, the most northerly of the Dodecanese and only 39 sq km in area, has achieved a world-wide fame out of all proportion to its size solely through its biblical associations. More than any other of the Greek islands it has, on account of its being where St John the Evangelist wrote the Apocalypse, become established as the one where the Hellenic world was integrated most closely with New Testament history.

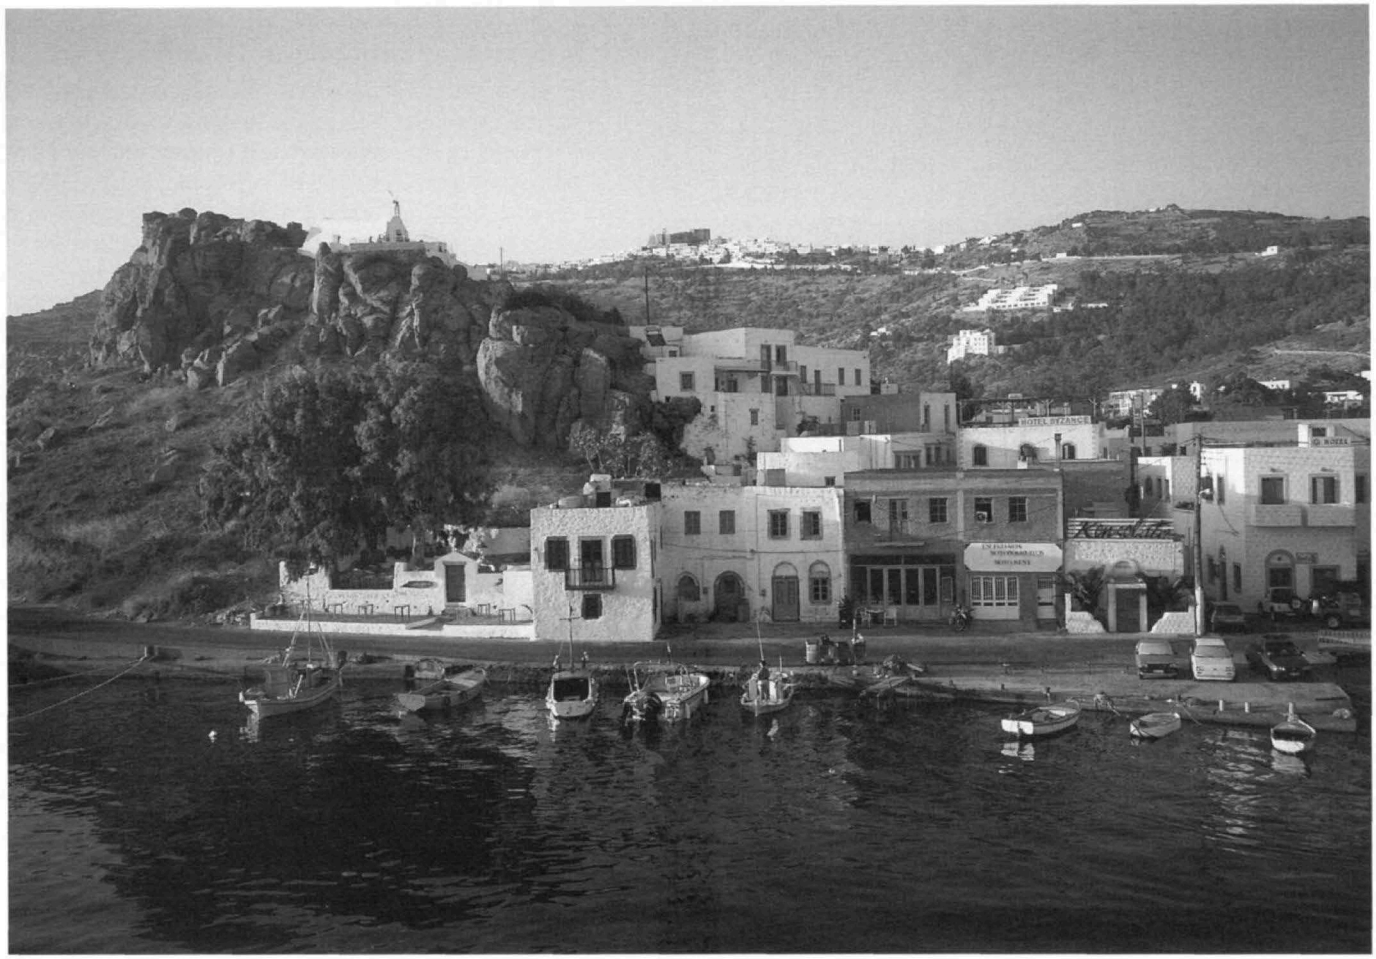
Patmos lies some 56 km off the coast of Asia Minor and 34 km from its much larger neighbour, Samos, to the north. It was never blessed with good agricultural conditions, having poor soil and little water, and has no deep natural harbour; it is quite hilly, with its highest point rising to 270 m. In early Hellenic history it was recorded as being peopled first by Mycenaeans, and later by Dorians and Ionians, but was only mentioned once in passing by Thucydides.

During the Roman period Patmos was used as a place of exile for political prisoners, and it was for this reason that St John (also known as St John the Theologian or St John the Divine, in Greek St John Theologos) was banished to the island, probably in AD 95, during the reign of the emperor Domitian. This association of the island with a major New Testament figure received surprisingly little attention during the earlier Christian centuries, and there is evidence of only one basilica being built here before 1088. It was then that almost a millennium of neglect was ended when the emperor Alexios I Komnenos granted to a monk from Bithynia, Osios ("the holy") Christodoulos, permission to found a monastery here dedicated to St John Theologos. It is this foundation, accompanied by a chrysobull of the emperor (still held by the monastery) and the grant of many privileges, that permanently changed the fortunes of the island, with the monastery's fame and prestige growing with every century.

The island was not named in the Deed of Partition of 1204, and the Venetians, after they had taken it over, seem to have allowed it substantial independence and granted a number of privileges. In the same way the Knights of Rhodes (the Hospitallers) never used Patmos as a base for harassing Turkish shipping, and this may have been the reason for the Turks allowing the abbot to collect the taxes that formed the island's annual tribute after 1454, treating the island and its inhabitants with considerable tolerance. The growing fame of the island made it the target of many later attacks, although the fortifications of the monastery ensured that no assailant was ever able to take it by force. Like the rest of the Dodecanese, Patmos did not return to full Greek control until 1947, when Italian rule ended.

The association of Patmos with St John has been responsible for two major foundations: one is the monastery mentioned above; and the second is the theological college, founded in 1669 when refugees arrived from recently occupied Crete. Its position as one of the leading theological colleges of Greece gives it a continuing importance for the Hellenic world, while the cave of St Anne, which is the traditional site of the writing of the Book of Revelation, is a dependency of the college.

The visitors that come to the island in their thousands each year ensure that the monastery dominates not only the landscape and appearance of Patmos, but also the life of the island. Its most prominent feature is its sequence of massive walls which continued to be strengthened and rebuilt until at least the later 17th century, giving it the aspect of a major fortress. They effectively protected the monastery from the plague of pirates which were to be the bane of Aegean life throughout the later medieval period and well into the 19th century. Within them the monastic buildings have grown, developed,



Patmos: the monastery of St John, founded in 1088, is on the skyline in the middle of the picture

and expanded, undergoing constant modification, rebuilding, and refurbishment. The two earliest building periods of the monastery were from 1088 to 1093 (within the lifetime of the founder) and the mid- to later 12th century, but the process of expansion has continued into relatively recent times. The earliest surviving parts are the later 12th-century *parekklesion* (side chapel) of the *katholikon* (main church), dedicated to the Theotokos, of which the contemporary frescos are the earliest in the whole monastery, and the *trapeza* (refectory), also of comparable date.

The library of the monastery contains one of the greatest collections of manuscripts in Greece, second only to some of those in the monastic libraries of Mount Athos, while the many rich and interesting objects in the treasury well reflect the monastery's fame and prestige. Among them are an 11th-century miniature mosaic icon of St Nicholas with a silver frame and other exceptionally fine 13th-century icons. It is, of course, objects of this kind, many of them made from precious metal, that are most liable to dispersal. They were brought to Patmos by donors from many parts of Europe, with Russia, Georgia, Romania, Moldavia, and Italy among the countries represented. Almost all objects of metalwork that remain date from the 18th century or later, reflecting the large losses that are known to have occurred. Manuscripts, some of which are now to be found in major public collections, also left the library at different times.

The cave of St Anne, where St John traditionally wrote the book of the Apocalypse, was not mentioned by Osios Christodoulos, and seems only to have been adopted in the 12th century; some wall-paintings in the sanctuary, discovered in 1973, are thought to be of this date and constitute the best evidence for its first identification. Nevertheless, it is probably true that the image of St John Theologos dictating to the deacon Prochoros in the cave, which appears on countless icons and gospel illustrations, is the form in which Patmos became most widely known during the medieval period and later.

PAUL HETHERINGTON

Summary

The most northerly of the Dodecanese islands, Patmos has been occupied throughout Greek history but only achieved fame in the Christian period. It was on Patmos that St John composed the Book of Revelation. In his name a monastery was founded in 1088 and a theological college in 1669.

Patras

City in the northwest Peloponnese

Patras is a commercial and industrial city in the northwestern Peloponnese, the capital of Achaea prefecture, the largest municipality, and the most important cultural and spiritual centre of western Greece. It is also the major port of the country for passengers travelling to and from the western Mediterranean. Patras is the third largest municipality in Greece after Athens and Thessalonica with a population of about 300,000. The city is divided into an upper and a lower town (Ano and Kato Poli). The upper town is built on a hill, whereas the lower is on a slope that extends to the sea. The city is located at the foot of Mount Panachaiko or Vodias, which is about 9 km from the sea. Patras is one of few Greek cities to have been built according to a city plan; its roads are straight and at right angles to each other. The establishment in 1966 of the university reinforced the role of the city as an important cultural centre. Even from the years of Ottoman occupation, the city was a big export centre and a major port to the western Mediterranean. Because of its strategic geographical position it developed early industrial enterprises such as the cotton-spinning mill that was established in 1844.

The name of the city is believed to be derived from Patreas, a mythological hero who is regarded as its first settler *c.*1100–1080 BC, although other opinions exist, e.g. that the name is derived from Patrous a district of Egyptian Thebes and was given to the city by a tribe that came from there, or from Patar, a town in Asia Minor. The most probable explanation seems to be the first one. Patreas' father was a nobleman from the region of Laconia in the southeastern Peloponnese who took shelter near Patras after he was found guilty of conspiracy against the authorities. Patreas then conquered the nearby towns and villages and unified them under the name of Patras. Pausanias (2nd century AD) described the city as a cosmopolitan one with many temples, statutes, and groves.

Patras was one of the 12 cities that made up the Achaean League, an ancient Greek version of the contemporary European Union. The city followed the policy of the league and neither fought against the Persians nor took part in the civil wars between the Greek cities. During the Peloponnesian War, Patras was a passive ally of Sparta without being actively engaged in the conflict.

The Achaean League was dismantled in 338 BC by Philip II of Macedon because it supported Athens against him. In the wars against the Romans, Patras and the re-formed Achaean League supported Philip V. However, after the Romans had defeated him and declared the city independent, it joined the Roman camp. Patras, like all Greek cities, became subject to Rome in 146 BC. After the battle of Actium in 31 BC the city was granted many privileges. It was declared independent and had its own council. It did not pay any taxes and the only liability imposed on it was acceptance of the Roman judicial authority.

According to tradition, St Andrew spent his last years in Patras and suffered martyrdom there *c.*AD 60. Patras was Christianized during the reign of Constantine the Great (307–336). The city was destroyed twice by the Goths, during the Byzantine period it suffered many raids from pirates, and in 805 it withstood a formidable siege by Vandals.

In the 9th century Patras was a thriving commercial city, and had established itself as a silk- trading centre. In 1204 Patras was occupied by Franks and again became a prosperous city for about 200 years. In 1408 the city came under the aegis of Venice and flourished commercially but in 1446 it was burned by Sultan Murad as it resisted the Ottoman invaders. After a brief period of protection by Venetian and Greek nobles, the city was captured by the Ottomans in 1461 and remained under their rule until the eve of the Greek revolution (1821). A brief period of resistance against the Turks in 1769, when the Orloff brothers came with their fleet to liberate the town, ended with the killing of its residents and the torching of the city. Patras was rebuilt and at the time of the Greek revolution was the main port for agricultural exports to western Europe.

In the city was based the Peloponnesian branch of the Society of Friends (*Philiki Hetaireia*), the principal revolutionary organization. From the start of hostilities Patras was one of the first cities to act against Ottoman rule and one of the first to be liberated. Despite the bravery of the rebels, the Turks could not be dislodged from the castle. Turkish reinforcements occupied the city which remained under Turkish rule until 1828 when the French philhellene general Messeaun liberated the Peloponnese. In October 1828 Messeaun delivered the city to the first Greek governor, Count Kapodistria.

During the following years the city rapidly grew into a big municipality with dynamic industrial and commercial enterprises. Moreover, it became the country's gateway to western Europe, and the export centre of agricultural products such as olive oil, tobacco, and currants. After World War II its port was established as the main transit centre to Europe and handled increasing numbers of passengers to and from Italy as the country became a member of the European Community. In addition, Patras is considered to be the main centre of culture in western Greece, renowned for its carnival that takes place during the winter.

DIMITRIOS GKAMAS

Summary

A city in the northwest Peloponnese, Patras was probably named after the mythical hero Patreas. As a member of the Achaean League it took no part in the Persian and Peloponnesian Wars. Under the Romans it was granted generous privileges and prospered. It was among the first cities to join the revolution of 1821. It is now a major port, industrial centre, and university town.

Patriarchate of Constantinople

In the ancient Church certain cities with patriarchs (members of the episcopate enjoying a position of prominence and special regard) were designated patriarchates. Thus, some, but not all, patriarchs oversaw a patriarchate. As early as the 4th century, patriarchates functioned as jurisdictional centres over smaller ecclesiastical regions, such as provinces and metropolitanates, within the neighbouring territory of the patriarchate. (This organization was a rough adaptation of the structure of Roman civil government.) Constantinople was one such patriarchate, with jurisdiction over Asia, Pontus, Thrace, and Greece.

It was claimed that the apostle Andrew founded the see of Constantinople and ordained Stachys its first bishop. The claim is doubtful and seems to have been motivated by a desire to convey an ancient, apostolic authority to Constantinople equal to that of Rome, whose Church claims to have been founded by St Peter. Such apostolic status could help resolve disputes concerning ecclesial primacy – Constantinople's claim could prove ecclesial superiority over Rome, given that Andrew was the first called of the apostles. If Stachys was nominated patriarch, it implied that Constantinople was endowed with the nobility and honour of a bishop; patriarchy certainly did not have the formal ecclesiastical sense it later acquired – on a par with that of a bishop or archbishop of Rome, Constantinople, Alexandria, Antioch, or Jerusalem, with specific ecclesiastical jurisdiction and correlative duties. That ecclesiastical jurisdiction included the right to decide canonical and moral issues as well as to ordain bishops to the principal sees within the provinces of a patriarchate. Regardless of such claims to apostolicity in the early Church after the 4th century – the incomparable role the patriarchate played in the formulation of Christian dogma is beyond dispute – the patriarchate of Constantinople enjoyed a preeminence second only to Rome. This status was due, in part, to the fact that Constantinople became the capital of the Roman empire and the patriarch was given authority by imperial decree as well as by ecumenical council. Canon 28 of Chalcedon (451), for example, declares Constantinople a "New Rome" and gives its Church the "equal privileges" (*isa presbeia*) to those held by the Church of "Old Rome". See also Canon 3 of the Council of Constantinople (381).

Constantinople formed part of the important ancient pentarchy: five sees which enjoyed particular ecclesiastical status and authority. The pentarchy comprised Rome, Constantinople, Alexandria, Antioch, and Jerusalem, and in the east this organization was viewed as an alternative to Rome's claim of primacy. The patriarchs of each of these sees succeeded the apostles in their status as heads of the Church and they had, according to *novella* 109 of Justinian I, final authority to govern the Church. Such equality, though, was more hoped for than realized. While Justinian I nominated the patriarch of Constantinople "ecumenical", i.e. with authority over the entire Byzantine empire, the papacy continued to insist on primacy in ecclesiastical matters, along with jurisdiction over all the eastern patriarchs. (The papacy had previously refused to acknowledge Canon 3 of Constantinople (381), giving the patriarch of Constantinople honour second only to Rome.) After the 6th century the papacy became less able to contest primacy as Rome lost political autonomy and stability. Due to loss of other members of the pentarchy – Alexandria, Antioch, and Jerusalem – to Arab invasions, the power of the patriarchate of Constantinople continued to increase. In the 9th century, however, the papacy began to regain ecclesiastical power as it learned to accommodate regnant political forces. The papacy employed its new-found strength, along with a tradition of ecclesial independence from Constantinople, to reassert its primacy.

This rivalry between the patriarchs of Constantinople and the popes of Rome culminated in 1054 when papal legates placed a bull of excommunication on the altar of Hagia Sophia. The bull excommunicated patriarch Keroularios of Constantinople, who responded by excommunicating, in turn, the papal legates. (These excommunications were rescinded in 1965 by mutual agreement between Pope Paul VI and Patriarch Athenagoras.) Roman dominance culminated in the establishment of a Latin patriarch in Constantinople in 1204 when the incumbent Greek patriarch, John X Kamateros, recognized the authority of Pope Innocent III. Subsequent Greek patriarchs ruled in exile at Nicaea until 1261. After the restoration of Greek patriarchal rule, however, the patriarchate was weakened by internal controversies, e.g. reunion with the Latin Church, as well as by exrernal political pressures. The external political pressures – the advance of the Turks – forced the emperor to take a politically and religiously divisive step: to solicit aid from the Church's theological rival, Rome. In response, the pope demanded a number of theological concessions – "innovations" in the Greek view – including acceptance of the *filioque* clause as well as observance of papal jurisdiction and the Roman rites. Proposals and counterproposals were made over the course of months at the Council of Florence (1438–39), and finally accepted by the Byzantine delegation. But much to the displeasure of the emperor John VIII, a majority of Orthodox believers were unwilling to abide by the terms and conditions of the agreement, believing that it required them to embrace heresy. The quip "Better to see the turban of the Turks reigning in our city than the Latin mitre" expressed common sentiment. Signatories of the Florentine reunion agreement, such as Gennadios II Scholarios, sensing the futility of their compromise as well as domestic political dangers, repudiated their signatures on returning home. The beginning of the end for the Byzantine patriarchate occurred in 1453 with the fall of Constantinople to the Turks.

Under the Turks the authority of the patriarchate was severely curtailed, and yet, paradoxically, also increased. The patriarch no longer had to share authority with the Christian emperor and thus the patriarch became the supreme religious figure of the Eastern Church. Furthermore, the sultan Mehmet II, conqueror of Constantinople, extended the patriarch's authority over all Greek- and non-Greek-speaking Christians under Turkish rule, giving the patriarch civil as well as religious authority. The patriarchate thus acquired both religious and civil power over more Christians under the Ottoman Turkish empire than it had under the Byzantine emperors, since the sultan (and the patriarch) now regarded previously independent Christian Churches as falling under the authority of the patriarch. The patriarch, in short, now also became the emperor of the Christian empire, and his vestments – a mitre

in the shape of the imperial crown, among other insignia – reflected the accretion of authority.

At the same time, patriarchal authority was severely curtailed by the sultan's required subordination of the patriarchate to himself. This practice, which continued under subsequent sultans, allowed the patriarchs to serve only at the goodwill and pleasure of the sultans, who directly and indirectly influenced the selection and retention of patriarchs. The sultans, for example, levied heavy taxes on each succeeding patriarch and persecuted the patriarchs severely, often making them responsible for any political instability created by the general Greek population. (In the 18th century, for example, 48 patriarchs served in 63 years.) Additionally, the religious (and physical) survival of the patriarchate required a certain political legerdemain, which occasionally engendered suspicion concerning the fidelity of the patriarch to the Orthodox faith. Among the sacrifices required of the patriarchate by the sultan was the appropriation of Hagia Sophia, which he turned into a mosque.

Gennadios II Scholarios, who was captured by the Turks on the fall of Constantinople but later released, became the first post-Byzantine patriarch. He served intermittently; the sultan, not yet confident of how to deal with the patriarchate, had him removed and reinstated. Gennadios's policy of accommodation with the Turks was finally unsuccessful and he was removed in 1465. His tenure provided the paradigm for his successors: a precarious reign marked by varying success at finding a harmonious modus vivendi. The political control of the patriarchate reached its apogee in the 17th and 18th centuries, during which time Greek bishops were given control over Bulgarian and Slavic sees and the local patriarchates were dissolved. The centralization of control included imposing Greek as the liturgical language, and Orthodoxy became identified with Hellenism. This cultural and religious identification led to a rather destructive form of Greek nationalism, subsequently alienating many of the foreign sees. Resentment at Greek control and the breakup of the Turkish empire led the various branches of the Orthodox Church to declare themselves independent of the patriarchate of Constantinople. Likewise, after the Greeks won independence, the Church of Greece declared itself independent of the patriarchate.

In the 17th century the patriarchate found contact with Protestantism useful in its quarrels with Rome, though beyond this utilitarian alliance patriarch Cyril I Lukaris was thoroughly sympathetic with certain Protestant views. Though most branches of Orthodoxy asserted and gained their independence in the 19th and 20th centuries, today the patriarchate continues to be viewed as spiritual leader by all Orthodox Christians. It has direct jurisdiction over, among other sees, the Orthodox Churches in North and South America, Australia, and western Europe. Politically, the patriarchate exists precariously under control of the Turkish government, suffering from efforts to diminish its authority even further.

Patronage

Patronage in the sense of established relationships between patrons and their clients is a common feature of many societies. The modern Greek nation state established in 1830 was based on a Western model of centralized administration under a monarchical government, whose autocratic powers were only partially checked by the introduction of a parliamentary constitution in 1844. This structure was imposed on a rural population of subsistence farmers. Inevitably the taxes levied on villages to support a distant administration of ministries, civil servants, and armed forces were seen as a regime of exploitation that drained resources from families and returned nothing.

That local communities seldom resisted, or negotiated with, central authorities was due to the segmented structure of such groups. Categorical obligations to their families that restricted individuals to forms of social and economic cooperation within a narrow circle of kinsmen and friends made corporate action on any scale difficult. It is true that in recent years producers' cooperatives have flourished but they are regarded, nevertheless, as organizations backed by the external authority of the state and villagers who act as their local officials are distrusted. Generally collective enterprises are undermined by consideration for the material interest and prestige of individual families. Instead, the heads of families have looked to form exclusive alliances in, or more often outside, the local community by offering their social, economic, and electoral support in exchange for a patron's influence in dealings with merchants, shopkeepers, or local agents of the state.

Typical patrons within the village are the elected president of the village council, whose signature and recommendation are needed on application forms to ministries and banks; the coffee shop owner, who may support a limited system of credit to his customers; and other men with wealth or outside connections. The client will refer to his patron as his "friend" to disguise the discomfort of his voluntary subordination. Nevertheless, if a "friend" uses his "means" (*mesa*) to protect and assist a man, the latter is under a general obligation to support his benefactor politically. Factions and clienteles loosely organized around relationships of friendship and patronage have historically been the basis for mobilizing support for national political parties in the Greek countryside.

If men cannot trust one another in their own community, the situation is much worse in their relations with people

outside it. They expect to find that merchants exploit them and that public servants will be at least indifferent. Town Greeks, for their part, hold markedly ambivalent attitudes towards villagers. There is a nostalgia for the austere traditional values that to some extent still survive in the countryside, but a deep contempt for the material and social limitations of peasant life. Despite the fact that most are themselves migrants, or the children of migrants, from the villages, the myths of their own history in the ancient city state and Byzantium are principally urban, and the styles of Western city life are the models to which they aspire. Apart from that they themselves share the belief that the family must be the principal object of moral duty and financial aspirations, which leaves little margin for concern about others. Where civil servants are concerned, the authority of the service, and their own position in it, are best preserved by keeping a villager in his place. This proper social distance is destroyed if undue concern is shown for a villager's affairs that is based simply on his rights as a citizen. Much business in public offices is done in the presence of more than one official. The ethos tends to be one of conscious self-importance, and the fact that many civil servants are themselves sons of peasants only increases this sensitivity. Within the public service itself status and position are defended by a reluctance to delegate the right of decision to junior officials. This in turn makes it difficult for any official to use his own judgement without referring to his seniors. This attitude, aptly termed *evthynophovia*, fear of responsibility, is transmitted to the public as an indifference based on a mechanical and inflexible interpretation of administrative procedures. Even trivial questions may be referred to Athens for a ruling. If delays are to be avoided in relatively routine applications for pensions or licences of various kinds, or exemptions are to be obtained in more complex cases, the need for "friendly" intervention is believed to be essential.

The search for an intermediary begins with the relationships that a villager has already established. As has been suggested, he may look to the president or some other influential villager or kinsman who can find the intermediary for him. Another possibility is that a villager may sell produce, grain, tobacco, or milk to a particular merchant who advances him credit, keeps him in debt, buys his produce at less than the market price, but in exchange for these benefits of an economic and assured supply is prepared to protect the welfare of his commercial client with his patronage. Provincial town doctors and shopkeepers, to whom villagers often turn in difficulty, are competitive and anxious to build and hold clienteles; lawyers are even more numerous and of many grades. There is a considerable amount of litigation in Greek rural life. If a villager has confidence in his lawyer this may have developed into a persisting relationship and, as the professional "fixer" in Greek society, the lawyer may be the most satisfactory intermediary. To confirm any of these relationships a man may ask a patron to become the godfather of his child, seeking to raise their association above the level of mere reciprocal advantage.

A critical institution in these relationships is the *parea*, the informal gathering of the town's professional elite which is sometimes to be seen sitting drinking in a public place such as the lounge of the best hotel. This group may include the prefect, senior army and police officers and civil servants, lawyers, doctors, judges, and the more substantial merchants. By their mutual acceptance and public recognition of one another they emphasize the exclusive status that they share. Not to respond to the reasonable requests of a friend in the elite circle is to threaten one's membership of it, even one's professional prospects and career. Friends and dependants of other members of the circle will not be sent for legal advice or as patients or customers. In the case of public servants there may be pressure to block promotion, or post a man elsewhere. Crucially, from time to time, the local member of parliament will arrive from Athens to enter into his notebook the favours asked of him, either directly by individual constituents or through the mediation of a member of the local elite.

Although the framework of party organization is based, to a considerable degree, on networks of friendship and patronage, it is not suggested that political behaviour is reducible simply to those kinds of personal relationship. Even in the countryside the personal obligations and relationships that at various removes link a deputy, or a candidate, to the voters are not, of course, unaffected by the scale and power of the national party he represents. A man is adopted as a candidate on a party list because he is influential and possesses an existing social or professional clientele. Equally the fact that he has been chosen by a party that may form the government adds considerably to his influence, particularly if the potential patronage is considerable. The traditional pattern of rural patronage is still the method of political recruitment in many country areas, but the considerable increase in agricultural incomes in more prosperous districts, where the greater part of the produce is sold in national and international markets, has greatly reduced the sense of insecurity which creates the need for the favours and protection of old-style personal patrons.

In urban areas the links between voters and the patronage of members of parliament have never been so comprehensive. But Greek towns are heavily populated with small family concerns of every kind. The need for loans and trading licences, negotiations with tax officials, the necessity of building a clientele of customers in a market generally too small to justify the proliferation of small competing businesses, draw him inevitably into relationships with professional, commercial, and political patrons and "friends" in terms not dissimilar to those already examined for rural patronage. The common feature in the two situations is the vulnerability of the client in defence of his independence. The principal difference is that in the city such relationships cannot provide a complete system of political recruitment. It remains true, however, that in the city political patrons work for their supporters, that a man with more than a routine difficulty in dealing with a government office, a hospital, a school, or any other institution will immediately attempt to find an influential friend or intermediary without whose aid he feels impotent and defeated, and that in any social or professional exchange when something is apparently conceded an obligation will be perceived and not forgotten. But any account of Greek patronage is inadequate that simply emphasizes reciprocal manipulation in an unequal relationship. The recognized ability to perform important favours is in itself the most significant and valued mark of status and prestige. Even when there is no reason to build a clientele, or mobilize votes, Greeks still need to demonstrate their social power and benevolence by the number and quality of their dependants. This is so in many societies, but in Greece

values of honour and self-regard give this process a particular impetus.

Paul, St

Christian apostle of the 1st century AD

Little more is known of Paul, the second founder of Christianity, than of Jesus Christ, the first. His own letters inform us that he was born an Israelite of the tribe of Benjamin, that he became a rigorous Pharisee, and that he persecuted Christians with zeal (Philippians 3: 4–6). It is widely believed, on the evidence of Acts 21: 39, that he was a Roman citizen from Tarsus in Cilicia. His writings partly corroborate Luke's story, which appears in Acts three times with variations, that he encountered the risen Christ while he was carrying his instructions to Damascus. The remainder of Luke's narrative is, however, not so easily reconciled with Paul's allusions to his own history. Where his biographer states that he always preached the Resurrection in the synagogues before turning to the Gentiles, the letters show compassion for the Jews but never speak of them as an object of his own ministry. Paul boasts of eight beatings and three shipwrecks (2 Corinthians 11: 24–25), yet the one flogging and the one shipwreck recorded in Acts both occurred too late to have figured in his reckoning. Acts knows nothing of the 14 years between Paul's conversion and his appointment as the "Apostle to the Gentiles" (Galatians 2: 1–7); Paul's account of a meeting with the Apostles in Galatians 2 cannot be harmonized with Luke's description of the apostolic council in Acts 15. Luke knows nothing of Paul's escape from Damascus under the governorship of Aretas (2 Corinthians 11: 32); Paul claims none of the miracles that Luke attributes to him. Nevertheless, the two records may be complementary rather than contradictory, and a tentative chronology of the letters may be built on Luke's divisions of Paul's labours into four successive journeys, each beginning from Jerusalem. The first began and terminated in Asia Minor, the second included leading cities of Greece and Macedonia, the third retraced the first two with a protracted stay at Ephesus, and the fourth brought Paul to Rome.

If Paul and Luke are both reliable witnesses, the letter to the Galatians would have been written to the churches of south Galatia between Paul's first and second meetings with the Jerusalem elders, as recounted in Acts 11 and 15. The text is a fierce polemic against the "men from James" (Galatians 2: 12; cf. Acts 14: 19), who in Paul's view have betrayed the first agreement by demanding the circumcision of gentile Christians. Paul maintained that the law had been superseded by the new covenant in the death of Christ (Galatians 3: 15), the carnal circumcision by an inward crucifixion, and the "faith that works by love" (6: 14; 5: 6). The apostolic council ruled in favour of Paul (on circumcision at least), but in the course of his second journey he found that deaths in Gentile churches had raised fears about the salvation of the body. Writing from Corinth (1 Thessalonians 3: 6; cf. 18: 5), he told the Thessalonians that the imminent return of Christ would rouse the dead from "sleep" and then the living would be taken up to join them "in the air" (1 Thessalonians 4: 13–17). Soon after, while he was passing through the Troad and Macedonia, he developed a richer doctrine in three letters to the Corinthians (1 Corinthians 16: 5; 2 Corinthians 2: 13; Acts 20: 1–6), which now survive as two. Every believer, he argued, is a member of a new body, that of Christ, which is united by love and diversified by gifts of the Holy Spirit. We must therefore keep our own bodies free from sin, and commemorate that of Christ in a common Eucharist, where the rich share with the poor. After death our animal body will be transformed into a spiritual body, which, like the true Temple of Israel, will be a "house not made with hands". For the present, the hope of future glory must sustain us as we suffer in the flesh.

Paul's voyage to Rome, occasioned by his own appeal to Caesar after he suffered a Roman flogging, was pre-empted by the letter which he sent to that city while bearing a collection to Jerusalem at the end of his third mission (Romans 15: 25–26; cf. Acts 21: 17). Declaring that Greeks and Jews owed their salvation to one another, he exhorted them to renounce their external pieties, to acknowledge the universal reign of sin in our present bodies, to embrace the resurrection with its promise of inward and outward renewal, and thus to live according to the new law of the Spirit, which is fulfilled in love and purity of heart. His subsequent imprisonment is attested by three letters, though the causes remain obscure. Whether he is enjoining Christ's humility on the Philippians (Philippians 2: 5–12), or warning the Colossians not to follow manmade heresies (Colossians 2: 3–23), or sending back the runaway Onesimus to Philemon, his thoughts are now consumed by the glorious destiny that awaits the "slave of Christ" (Philippians 1: 1; Philemon 1: 1; Colossians 4: 3). According to tradition Paul was decapitated in the Neronian persecution of AD 64, though not perhaps before he achieved his goal of visiting Spain (Romans 15: 24).

Paul may have been the earliest writer to place the confession of Christ as Son of God at the heart of the gospel. He was also the first to offer any theory of atonement, describing Christ as a sacrifice (1 Corinthians 5: 7), as one who became a curse for us (Galatians 3: 15), and as a mercy-seat (*hilasterion*) for our sins (Romans 3: 24–25). His account of the Last Supper (1 Corinthians 11: 23–25) found its way into the liturgy, and his argument that it is better not to marry (1 Corinthians 7) seemed to justify the celibacy of monks. He was variously interpreted, and both Catholics and Gnostics can be reckoned among his heirs. It was therefore almost inevitable that those who wished to claim him should attach his name to spurious compositions. The letter to the Ephesians would

appear to be a summary of Paul's mature doctrine by another hand. In the letter to the Hebrews his thoughts are encased in a carapace of arguments and expressed in texts more suited to its (supposed) recipients. The author of 2 Thessalonians was evidently desirous to acquit Paul of a false belief that the world was soon to end. The three "Pastoral Epistles", addressed to Timothy and Titus, were produced to lend authority to the episcopate which developed after his death. They already betray the legalistic, patriarchal, and anti-Jewish sentiments which mar many later readings of the apostle. Among early commentators, Origen took Paul's distinction between the inner and outer man as the key to an allegorical interpretation of scripture, while the Antiochene school of Theodore, Theodoret, and Chrysostom gave more weight to his personality, his audience, and the circumstances of his writing. All agreed, however, that he was preaching not so much freedom from the law as freedom to obey it in the Spirit; hence the Greek Church has resisted antinomian exegesis, with its concomitant beliefs in total depravity and irresistible predestination. Holding that Paul intended to change his hearers and not merely to formulate doctrine, Greek theology emphasizes the ethical and sacramental elements in his thought.

Biography

Born (as Saul) at Tarsus in Cilicia, Paul was a Jew and a pharisee who persecuted Christians. Converted to Christianity *c.*AD 33, he became known as the "Apostle to the Gentiles". He undertook four missionary journeys and wrote epistles to many young churches. He was imprisoned in Rome and executed, probably in AD 64.

Paulicians

Dualist sect

Paulicians was the name given to a group of militaristic dualist heretics who were active in Armenia, eastern Asia Minor, and later Thrace throughout the Byzantine era. There is still much scholarly debate over the nature of this sect due to the conflicting information contained in the sources. Peter of Sicily, who was sent as an ambassador by the Byzantine emperor to the Paulician state based in Tephrice in 869, is the most important source. According to Peter, the group originated with Paul of Samosata in the 3rd century, from whom they took their name. This identification has led to much confusion since there were two Pauls associated with Samosata, one a bishop of Antioch who promoted the Adoptionist doctrine and another, the son of a woman named Callinice, who was reputed to be a Manichaean. However, this woman could not have been a Manichaean since her son lived well before Mani's birth. It is more likely that she was a Gnostic, possibly even a Marcionite. Nevertheless, the confusion has led to the tradition of associating Paulicians with Manichaeanism.

The true origin of the sect probably goes no further back than the 7th century when an Armenian by the name of Constantine of Mananali learned the heretical doctrines in Syria and later took the name Silvanos, a companion of St Paul. He taught his followers to read only the New Testament and rejected those Manichaean doctrines which conflicted with Christianity. However, Peter of Sicily claimed that the sect used the teachings of the New Testament only for the ordinary members of the sect and had a secret teaching reserved for a select few in which dualist doctrines were taught. Dimitri Obolensky sees in this the influence of the Gnostic Marcionite sect with whom the Paulicians came into contact in Armenia. These contacts, coupled with the reforms of Constantine, made the Paulicians closer to Marcionism in doctrine than Manichaeanism. In addition, Obolensky notes some similarities with Messalian beliefs and concludes that Paulicianism arose under the combined influence of Manichaean, Marcionite, and Messalian sects. He also affirms that all the main tenets of Paulicianism, such as belief in the two principles, denial of the Incarnation, rejection of the Old Testament, anti-sacramentalism, etc., are derived from Manichaeanism and further argues that the absence of certain Manichaean doctrines, such as abstention from meat and sexual intercourse, as well as the Manichaean creation myth, were due to the reforms of Constantine-Silvanos. The Paulicians estab-

lished themselves in Asia Minor under a succession of leaders who took Pauline pastoral names. The use of the name "Paulician" may actually be a reflection of the high regard in which the sect held the apostle Paul. The churches they founded were also named after places associated with St Paul.

Armenian sources, on the other hand, point to a tradition that the Paulicians were actually an Armenian sect dating back to the 5th century. The earlier sources do not mention them by name and scholars are not sure if they can be identified with these earlier heretical groups. However, in the 7th and 8th centuries they are specifically mentioned by name in the "Canons and Constitutions" of the Council of Albania, the Council of Dwin, and in the tract *Against the Paulicians* by John of Otzun. The Armenian sources also differ from the Greek in their characterization of Paulician doctrine by claiming that the Paulicians followed the Adoptionist doctrines of Paul of Samosata who argued that Christ was originally an ordinary man who was adopted by God as the Son of God for his extraordinary virtue, a condition which any equally righteous person can achieve. This argument was first advanced by Fred Conybeare who, in 1891, discovered a manuscript of the tract *The Key of Truth*. The theology of this work reflects Adoptionist Christian beliefs and even contradicts some known Paulician doctrines, such as dualism and rejection of the sacraments. Conybeare claimed that this work was a true manual of the Paulician Church and that it confirms that the Paulicians were Adoptionists, the descendants of Paul of Samosata, a position which has received more recent support from Nina Garsoïan. This argument was originally rejected by Steven Runciman, and later Paul Lemerle, who identified this Adoptionist Armenian group as the Thonraki, a sect which shared some doctrinal similarities with the Paulicians and were later confused with them. The Paulicians were also iconoclastic. Some of their number were later invited into the Byzantine empire by the iconoclastic emperors Leo III (717–41) and Constantine V (741–75). Garsoïan argues that it was during this time that they probably came under the influence of Gnostic dualism (which is how their beliefs are characterized by the Greek sources). Here they were then described as descendants of the Manichaeans who believed in the two principles of good and evil and equated the material world with the evil principle. All the sources agree that the Paulicians rejected the authority of the Orthodox Church and its sacraments and images, including the cross. The Paulicians were eventually driven from Constantinople by the empress Theodora in 842. They fled to eastern Asia Minor where they organized themselves militarily and established their own state centred around Tephrice. This fact in and of itself should cast doubt on the characterization of them as Manichaean, since Mani did not advocate warfare for his followers and even forbad the killing of any living thing. The Paulician state was eventually crushed by Basil I in 872 and a number of Paulicians were forcibly settled in Thrace around Philippopolis, where they are subsequently believed to have influenced the Bogomils.

The Paulicians would occasionally reappear in later Byzantine sources. Anna Komnene recounted the experiences of her father Alexios Komnenos (1081–1118) with this sect. The Paulicians revolted against the Byzantines in 1078, but were suppressed by Alexios Komnenos before he became emperor. Despite this experience, in 1081 the Paulicians made up part of Alexios's army in his campaign against Robert Guiscard. After Alexios's defeat at Dyrrachium the Paulicians deserted and returned to Philippopolis. Alexios had to wait until after his victory over the Normans at Kastoria (1083) to punish the Paulicians for their treachery. Unable to attack the Paulicians in their stronghold at Philippopolis, Alexios lured a delegation of Paulician representatives to appear before him at Constantinople. Once this delegation arrived in Constantinople, Alexios had the Paulician leaders arrested and imprisoned. Later, he agreed to pardon those heretics who apostatized and accepted baptism. Those who continued to resist conversion were exiled to some islands. Later that year (1084) a mutiny broke out under the leadership of a Paulician named Traulos, who was a servant in the imperial household, and was only suppressed with great difficulty. In 1114 Alexios established his headquarters at Philippopolis and took the opportunity to try personally to win the heretics over to Orthodoxy. Despite his failure to convert the leaders of the Paulicians, Anna reported that hundreds of their followers accepted conversion. The apostates were later settled in a new city located near Philippopolis called Alexiopolis or Neokastron. Alexios then returned to Constantinople where he resumed his theological debates with the imprisoned Paulician leaders. Only one of them relented and embraced Orthodoxy while the others were unregenerate and remained in prison until their deaths.

Another source which mentions the later activities of the Paulicians is the 14th-century account *The Life of Saint Hilarion of Moglena*, written by Euthymios of Trnovo, which includes a description of the saint's efforts to suppress the large number of heretics residing in his diocese, which included Bogomils, Paulicians, and Monophysites.

Summary

A heretical sect of Armenian origin, the Paulicians appeared probably first in the 7th century and established themselves in Asia Minor. They were iconoclasts and dualists, but there is debate about the precise nature of their beliefs. In the 9th century they had their own state centred on Tephrice. They appear occasionally in the sources throughout the Byzantine period.

Pausanias *c.*AD 115–180

Travel writer

All our information about Pausanias' life has to be gathered from his work: he was not yet fully adult in AD 130 (8. 9. 7); the first book of his work must have been written before Herodes Atticus' great building programme in Athens, i.e. before AD 160; his historical references stop around AD 180. We know next to nothing about his personal life; his work lacks a prologue (where ancient writers usually introduced themselves) and a dedication; even his name is known only from the early Byzantine geographer Stephanus (who used Pausanias' work as a source around AD 535). Pausanias originated from Lydia, probably from Magnesia ad Sipylum, because he describes this region with extraordinary care and knowledge. He was born into a wealthy family of the city's elite; his work shows him to be a highly educated man, and he had the means to dedicate his life to extensive travelling (apart from Greece, he knows the whole of western Asia Minor, large parts of central Anatolia, Syria, Palestine, and Egypt). As he rarely mentions living people, we know nothing about his friends or the circles he associated with.

Pausanias' work, the *Periegesis Hellados* (Guide to Greece) in ten books (about 900 printed pages), is very probably completely preserved. Because parts of Greece are missing in the description and the work has no epilogue, it was sometimes thought that it remained incomplete or that the last part had been lost; this, however, is unlikely, for numerous cross-references throughout show that it was written following an elaborate plan from the beginning. Periegesis as a genre arose in Hellenistic times (3rd and 2nd centuries BC), but before Pausanias these works were mostly monographs on very restricted themes. Pausanias' Greece comprises the Greek mainland on the Balkan peninsula; the ten books deal with: (1) Athens, Attica, Megara; (2) Corinth, Argolis, the island of Aegina; (3) Laconia; (4) Messenia; (5) and (6) Elis (with a detailed description of Olympia); (7) Achaea; (8) Arcadia; (9) Boeotia; (10) Phocis (above all Delphi), and parts of Locris. On the one hand, Pausanias aims to select the most valuable and remarkable from the abundance of curiosities that he saw, but on the other hand he also wants to be as comprehensive as possible; so he often describes small and remote places. Each book starts with an introduction about the legends and mythology of the region, and Pausanias also gives historical explanations concerning the monuments he describes.

In the 19th and early 20th centuries Pausanias was considered a third-rate author, harshly judged by, for example, the influential scholar Ulrich von Wilamowitz-Moellendorff, and accused of plagiarizing older works and not really having seen the things he described. Only since the beginning of the 20th century has it become clear how conscientiously Pausanias fulfilled the task he had set himself, and how astonishingly reliable he is. For a whole series of ancient places he was the decisive guide for modern excavators: at Mycenae, Heinrich Schliemann was the first to understand Pausanias' passage about the town and to draw the right conclusions – namely, that the graves must lie *behind* the Lion Gate; when the monuments of Troezen were excavated in 1941, their identification was possible only because of Pausanias' precise report. His systematic description of Messene, too, was confirmed by the finds; in the town of Callipolis, which according to Pausanias was totally destroyed by the Celts in 279/278 BC, excavations brought to light the completely burned buildings.

Pausanias was well versed in ancient Greek authors, above all lyric and epic poetry (which he often quotes) and, of course, the historians, of whom Herodotus was his great model. In his historical digressions he can be careless, and it is sometimes unclear whether he is giving his own interpretation or quoting from an older source and, if so, from which. On the other hand he is very reliable when he extracts historical facts directly from a monument: he reports hundreds of inscriptions, many of which have been confirmed by finds and have often proved very helpful for the transcription and historical setting of them.

Pausanias never explicitly states his personal preferences, but they become clear from his selection. First of all, it is its age that makes a site or cult interesting to him; this taste for the ancient is characteristic of the 2nd century AD and shared by many of his educated contemporaries. A more personal trait is his preferring religious monuments to profane ones. In matters of art, Pausanias again shows the high appraisal of the past characteristic of his epoch: he bestows the first place on Phidias, the second on Alcamenes (4. 10. 8); he appreciates some sculptures of the 6th and all of the 5th century BC, as well as the sculptors Cephisodotus and Praxiteles of the 4th century; but only Damophon of Messene of the later period; he has no regard for Polyclitus and Lysippus; nor does he even mention Hellenistic art or Pergamene "baroque". Similarly, the buildings that please him are from the 5th and 4th centuries BC.

Historically, Pausanias is interested in the period of independent Greece (mostly the 4th century BC); he judges Greek states according to their behaviour when Greek freedom was endangered; in his eyes, only Athens always did its duty. Though living in the Roman world, Pausanias feels totally Greek, as his work shows throughout. He exhibits no open resentment towards the Romans, but they are foreign rulers, and unlike some other contemporaneous writers (e.g. Aelius Aristides) he does not regard Roman world dominion as logical or natural; he points out the brutalities and pillagings of Roman generals, above all of Sulla. However, as things improved in the 2nd century AD, Pausanias several times praises the philhellene Roman emperors Hadrian, Antoninus Pius, and Marcus Aurelius, who showed respect and care for Greece and its heritage; but he never appreciated Greece's loss of freedom.

Unlike other "intellectuals" of his time, Pausanias did not catch the public eye and apparently failed to reach the readership for whom he wrote, perhaps (as Habicht suggests) because by the time of his writing the great wave of Roman "philhellenism" was already over. Another reason for this neglect may be the curiously mixed character of his work: for people who just wanted a traveller's guide the long historical digressions were boring, while those more interested in history did not want to read descriptions of buildings and works of art they did not have before their eyes. Apart from Stephanus of Byzantium (see above), the only attested reader of Pausanias in antiquity may have been Aelian (*c.*AD 200). In Byzantine times, too, he is apparently ignored by Photios, but Arethas read him and probably commissioned a minuscule copy of the text (now lost), which in turn was read by Maximos Planudes (late 13th

century) and Nikephoros Gregoras (14th century); some excerpts are already found in the *Suda* lexicon. Around 1400 Arethas's manuscript came to Italy, establishing Pausanias' presence in the west, which was to be so valuable for archaeologists in the 19th and 20th centuries.

BALBINA BÄBLER

Biography

Born *c.*AD 115 to a wealthy family in Lydia, probably at Magnesia ad Sipylum, Pausanias was well educated. He had the resources to spend his life travelling and writing about his travels. He knew Asia Minor, Syria, Palestine, and Egypt; but his only surviving work is a "Guide to Greece" in ten books. Nothing is known of his life but he probably died *c.*180.

Pelagonia, Battle of

Battle fought between Nicaeans and an alliance of Epirots and Latins in 1259

The decisive battle of Pelagonia (near modern Bitola in former Yugoslavian Macedonia close to the Greek border) in 1259 saw Greek forces engaged on both sides to decide the future fate of the Latin empire in Constantinople. This empire was founded in 1204, when a joint enterprise of Venice and western knights, the so-called Fourth Crusade, conquered Constantinople. Although the crusaders had taken the capital, they did not succeed in gaining control over the whole territory of the collapsed empire in Asia Minor and the southern Balkan peninsula. Seljuk rulers and the newly refounded (1185/86) Bulgarian state seized their advantage. Greek resistance sprang up in various provincial areas and resulted in two regional powers, the despotate of Epirus and the empire of Nicaea (modern Iznik, *c.*160 km southeast of Istanbul). In armed rivalry they tried to reach a common aim, the recapture of Constantinople for the Greeks.

In 1258 the Epirot leader Michael II hoped that a change in Nicaean rulership might offer the opportunity to strengthen his position. By marriage ties he arranged an alliance with two Latin powers also interested in Balkan affairs: Manfred of Sicily, the illegitimate son of Frederick II of Hohenstaufen, pursued plans similar to the Norman ambitions of the 11th and 12th centuries and had already (1257/58) occupied parts of the Albanian coastland; William (Guillaume) II of Villehardouin, prince of Achaea (Peloponnese), wanted to extend his influence beyond the Corinthian Gulf, thus finally becoming the leader of the Latin rulers in the entire region. Their common opponent, Michael VIII Palaiologos, now emperor of Nicaea, recognized the imminent danger. After diplomatic negotiations had failed (see Akropolites, 1978, p. 79), in the spring of 1259 Michael's general and brother John Palaiologos attacked Michael II's positions in western Macedonia (around Ohrid) and forced the despot himself to retreat to Valona (modern Vlore in Albania). Here he got reinforcements from Manfred (400 heavily armed cavalry). William's forces, who came from the south, met him at Arta (summer 1259). The united armies crossed the Pindus mountains and marched in an easterly ark (see *Chronicle of Morea*, 3618–39, 3672–95) northwards (via Servia and Soskos) towards Prilep, which apparently had to be relieved (Akropolites, 1978, p. 81) before an attack on Thessalonica. The advancing forces suffered from constant attacks by swift Cuman archers on horseback. When tempers were frayed a quarrel flared up among the allies (see Pachymeres, 1984, 1. 31). As they were encamped around Pelagonia one night, a secret messenger from the Nicaean army reached Michael and somehow convinced him that his Latin partners would soon desert the common cause for their own profit. (The weak points in the triple alliance from the very beginning – diverging interests and the different cultural backgrounds of its members, cf. Gregoras, 1978, 3. 5 – now caused its breakdown.) Immediately the despot retired, and most of his soldiers did so before dawn. On the following day John's army attacked the numerically shrunken and certainly shocked enemy and won a decisive victory (September 1259), in which once again archers played a major part (*Chronicle of Morea*, 3950–4091). William was taken prisoner and only released two years later in exchange for considerable territorial concessions in the Peloponnese, where a new Greek–Frankish frontier was drawn. Michael II – after a short setback due to Pelagonia – was able to regain his local dominion, backed by Manfred, for whom the Epirot despotate served as a protective shield against Nicaean attacks on his Albanian possessions. For Baldwin II, Latin emperor in Constantinople, the outcome of Pelagonia extinguished any hope of political survival. On 15 August 1261 Michael VIII Palaiologos solemnly entered the traditional capital of the renewed Byzantine empire.

EWALD KISLINGER

Summary

At Pelagonia (near Bitola in the Former Yugoslav Republic of Macedonia) a battle was fought in 1259 between an alliance of Michael II of Epirus, Manfred of Sicily, and William II of Villehardouin on the one hand and Michael VIII Palaiologos of the empire of Nicaea on the other. Palaiologos won a decisive victory on the strength of which he was able to recapture Constantinople from the Latins in 1261.

Pelion, Mount

Region in Thessaly

Mount Pelion, often referred to as the mountain of the centaurs, has been an inspiring place from antiquity to the present day. Its place in mythology is marked by many references in Homer, Pindar, the tragedians (especially Euripides), and Apollonius Rhodius. It is situated in central Greece, in Magnesia, north of Mount Ossa. It was believed to be the home of the centaur Chiron, the wisest of the centaurs, associated with the education of many heroes such as Heracles, Achilles, Jason, and Asclepius. In Hesiod's version of the Gigantomachy, Mount Olympus was challenged when the Giants tried to pile Pelion on Ossa. Jason used timber from Pelion in order to build the ship *Argo* for his voyage to Colchis with the other Argonauts to get the golden fleece. The marriage of Thetis and Peleus was celebrated on Mount Pelion. Although it has an eminent position in Greek mythology, it was most probably not settled extensively in ancient times, except for some areas on the coast, e.g. Pagasae, Iolkos, Aphetae, Orminion, and, in Hellenistic times, Demetrias. There are, however, archaeological remains of sanctuaries, such as the temples to Zeus Akraios on the Pliasidi peak and to Apollo Koropaios at Boufa (on the west coast).

In Byzantine times Pelion was a monastic mountain. Many monasteries were built on the western slopes in particular. Excavations in the village of Lafko have brought to light Byzantine ceramic objects. Pelion has also played an important role in modern Greek history. During the Ottoman period several villages were granted administrative privileges that encouraged the practice of trade. The village settlements date from the 16th century, as is the case with many mountain areas in Greece. A number of communities were first established around monasteries. The Ottomans preferred to be in the plains rather than the mountains and that was an important factor in the movement of the local population towards the mountains. Due to the rich vegetation and abundance of water it was easy to develop a strong agriculture, and later, with various capital investments, industry and trade. Soon Pelion's commercial interests spread not only to the rest of Greece but to important commercial centres of Europe and Asia. Until the end of the 18th century it was a centre not only of the textile industry but also of shipbuilding.

Many villages became exceptional intellectual centres in which famous schools were established, particularly in the period of Greek Enlightenment. Milies, one of the most famous cultural centres of Pelion, had a school and a library rich in rare books that survives until today. Intellectuals such as Anthimos Gazis and Gregorios Konstantas are associated with the place. Zagora, Pelion's largest village, also had a library and a school where many fathers of the Greek revolution studied, including Rigas Velestinlis. Most information concerning Pelion for the 18th and 19th century comes from scholars such as Dimitrieis, Daniel Philippides, Nikolaos Magnes, and Nikolaos Georgiades. Intellectual life was very lively and was particularly associated with the debate about the Greek language. Philippos Ioannou and Gazis argued for the archaizing form known as katharevousa, whereas Konstantas and Philippides (both directors of the Milies school) were zealous supporters of demotic. The above-mentioned scholars were also part of the Greek Enlightment movement that promoted the belief in a solid education and scientific research in all disciplines. Korais was associated with the views of Gazis in the linguistic debate, and Katartzes with those of Philippides. The late 18th-century patriarch Kallinikos was a native of Zagora.

Pelion is also of interest for the artistic trends that were developed there both in secular and in religious painting. Popular art adorned the interior of many mansions, particularly in the villages of Makrinitsa, Portaria, Zagora, Drakeia, and Hagios Laurentios. The famous folk artist Theophilos Chatzimichail lived and worked in Pelion for some time until 1927. Many villages have post-Byzantine churches such as St George and St Kyriaki in Zagora, the Dormition of the Virgin in Mouresi, and the church of Panagia in Portaria, and bear witness to a strong iconographic tradition in the area. What is more interesting for the art historian is the folk element that has been incorporated into the received Byzantine tradition. As with post-Byzantine iconography in general, particularly in the 17th and 18th centuries, there are obvious influences from the Western and Russian traditions. The local architecture is perhaps the most distinctive feature of Mount Pelion. The traditional "tower" type houses with many small, narrow windows and several storeys (an architectural style believed to have developed in wartime) cling to the slopes of the mountain. The roofs of the local grey or greenish stone have become typical of the mountain. Makrinitsa, perhaps the most famous village nowadays, is a fine example, one of many, of the traditional architecture. With its highly attractive landscape which combines both mountain and sea and distinctive traditional colour, Pelion has also become a major tourist centre.

ANDROMACHE KARANIKA-DIMAROGONA

Summary

Mount Pelion, in central Greece, was important in mythology as the home of the centaur Chiron, but the area was not much settled in antiquity. In Byzantine times many monasteries were built on its

slopes. During the Tourkokratia it developed as a commercial centre (textiles and shipbuilding); as an intellectual centre (schools and libraries); and as an artistic centre (with folk art incorporated in the post-Byzantine tradition).

Pella

City in Macedonia

The fortunes of Pella, which became the chief city of the Macedonian kingdom, mirror those of the kingdom itself. The city was situated in the region known as Bottiaea, to the north of what was until quite recently the lake of Giannitsa, the ancient lake Lydias. This was originally an inlet of the sea, but the major rivers which flow into it, the Haliacmon, the Loudias, and the Axios, gradually caused it to silt up, and it was finally drained in the 1930s. In Classical times, in the 5th and 4th centuries BC, the southern part, near the original Macedonian centre of Aegae, had already silted, but there was still open water to the north, accessible from the sea by boats. There was no dry route across it from the south at this time, and the land route had to skirt the silted, marshy area. The incorporation of Bottiaea into the Macedonian kingdom, at an uncertain date before 500 BC, gave the Macedonians access to the Axios valley and the lands beyond, where there were rich silver mines, certainly exploited by the Macedonians in the reign of Alexander I, in the first half of the 5th century BC, though their hold on this region was somewhat precarious. As a result, the old centre of Aegae was in effect at one end of the Macedonian kingdom, and gained access to the extended territories only by the roundabout overland route. When at the end of the 5th century the king Archelaus sought to modernize and so strengthen his kingdom, one of his most important actions was to develop a new capital at Pella, more in the centre of the extended state.

Not much is known about Archelaus' foundation. He built a palace on the low hill which seems to have functioned as the acropolis. The cemeteries of this city have been partly excavated, and their position suggests that the town extended only on the immediate slopes of this hill, to the south of it. The town was probably sacked (though there is no archaeological evidence for this as yet) by the Illyrians during their incursion in 359 BC, which almost destroyed the Macedonian state.

Under Philip II the Macedonian kingdom revived and reached unprecedented bounds, and with it, Pella. A new plan was laid out covering an area of at least 1.5 × 1.2 km, with the acropolis at the northern end, and the city extending down to the water's edge to the south. Within this a regular grid plan was laid out, with blocks measuring 110 × 48 m, running north to south and separated by streets some 6 m wide. On the flatter ground below the acropolis was the agora, a vast, near-square space 200.15 × 180.50 m. It was approached by a principal east–west street, noticeably wider than the others, an arrangement which seems to have been pioneered by the agora named after its town planner, Hippodamus, at Piraeus. This is town planning on a lavish scale. It is comparable, in general size, with the late 5th-century BC layout of Rhodes, but the detailed plan, with its repetition of blocks in the proportion 2:1, is not quite the same as Rhodes, where the blocks are subdivisions of square units demarcated by wider streets. The best antecedent for Pella seems to be the enlarged city of Olynthus (late 5th century) in Chalcidice, which is closer to hand and a more obvious model for town planners employed by Philip, even though he had destroyed the Greek city. Olynthus, however, does not have the large central agora. Evidence for the actual development of the city within this plan is as yet only partial. The agora was surrounded by stoas which seem to have been continuous on all four sides of it, with a double row of rooms behind them, some of which were certainly used as shops. The northern part may have been more official, the southern part commercial, the dividing line being the main road which passes through the colonnades into the central square. However, the architectural development of this agora appears to be relatively late, of the late 3rd century BC, the time of Philip V, rather than of the original layout by Philip II.

The most striking feature of Pella is undoubtedly a group of luxurious houses situated south of the agora. One of these, designated by its excavators the House of the Rape of Helen (from the subject of a scene depicted on one of its mosaic floors), occupied half of one of the street blocks. Its rooms were arranged round a large courtyard embellished by 8 × 8 Doric columns. The main rooms on the north side, with the mosaics, were surmounted by an upper floor, with a gallery of Ionic columns overlooking the court. The House of Dionysus, two blocks to the east, was even larger, taking up two-thirds of a street block. A doorway with a two-column porch gave on to an entrance hall running east to west between two courtyards, that to the north with 6 × 6 Ionic columns, that to the south with 8 × 8 Doric. The north side, again, was surmounted by an upper floor, with, probably, another gallery overlooking the court. All the mosaics in these houses are splendid examples, with figure scenes, made from complete pebbles, the earlier system, rather than the cut tesserae used in late Hellenistic floors at Delos and elsewhere.

These houses are of a particular magnificence, and, as far as the archaeological evidence goes, without parallel in the Greek world. Yet at Pella they are only two among others, and though this may well represent the wealthiest part of the city, they should not be regarded as special or public buildings. What they indicate is the degree of wealth achieved in Macedon as a result of the conquests of Philip and Alexander, to which period, from their architecture and contents, they undoubtedly date. The House of the Rape of Helen measures nearly 50 × 50 m (actually 2350 sq m), that of Dionysus about 50 × 65 m (3160 sq m), in contrast to the houses in Olynthus,

which are approximately 15 × 15 m (215 sq m). Houses of a similar scale to those of Pella are implied by the street plan of Hellenistic Alexandria, but are there associated with a layout rather of Rhodian type. Houses in other Classical cities, where evidence exists, are only of the same size as those at Olynthus.

Pella thus indicates a level of luxury beyond that of the Classical cities, the benefits, doubtless, of conquest and empire, but demonstrating what the Macedonian kings had achieved. This, in turn, makes clear some of the motivation behind the fact that not all the citizens of Athens (to name only one of the Classical cities defeated by Philip) were inclined to oppose collaboration with the Macedonians.

The agora shows signs of sudden and unexpected destruction. One of the shops was a potter's workshop, containing moulds for terracotta vases decorated in relief. The systems of decoration depict, among a variety of subjects, scenes from the Homeric poems. That they remain as they were stacked in the shop, and also the overthrown columns of the luxury houses demonstrate that the city was destroyed by an earthquake, rather than the hostility of the Romans at the conclusion of the Third Macedonian War or the subsequent insurrection. But in the longer term Pella was ruined rather by the silting up of the lake, and the rise of Thessalonica, more conveniently placed by the sea, to serve as the principal harbour town of Macedonia. Pella was virtually extinguished. The Romans developed a new town a short distance to the west, but it never flourished. Thus Pella played only a brief part in the development of the Hellenic tradition. It was, however, a vital stage in a continuity which passed not only to Thessalonica, as its direct successor, but also to Alexandria as the outstanding city of the Hellenistic world.

R.A. TOMLINSON

Summary

The capital of the Macedonian kingdom from the end of the 5th century BC, Pella was sacked by the Illyrians in 359 BC and rebuilt by Philip II on a grand scale. The size of the city and the opulence of its houses indicate the benefits of empire won by Philip and Alexander. The city seems to have been destroyed at some point by an earthquake, but in the longer term it was eclipsed by the silting up of the lake and the rise of Thessalonica.

Peloponnese

Region of southern Greece

The Peloponnese (Peloponnesus) is the southernmost part of the Greek mainland, and has an area of 21,439 sq km, which is 16.24 per cent of the total area of Greece. An island originally, it was twice united and separated from the mainland by intense geological upheavals. It is thought to have been named after the legendary hero Pelops and, although it is called *nesos* (island), implying that the entire region was thought of as an "island", i.e. a separate part of Greece, it is actually a broad peninsula. On the west, south, and east it is bordered by the Ionian, Mediterranean, and Aegean seas respectively; but it is connected to the mainland of central Greece (Attica and Boeotia) by the isthmus of Corinth, formed by a subsequent retreat of the sea. In the 19th century this land bridge was cut to make the Corinth Canal, which almost made the Peloponnese into an island once again. Physically, the land is rugged and mountainous in its interior, and settlement is largely confined to the coastal plains and river valleys. Most villages cling to the steep mountainsides while the valley floors are reserved for farming. Products include wheat, citrus fruits, olives, tobacco, figs, and grapes. However, the greater part of the Peloponnese is mountainous, uncultivable, and poor. Sheep and goats of the pasturage and swine of the oakwoods are the main livestock that can be reared on about 50 per cent of the surface which consists of chalk and limestone. Climate and flora vary greatly according to the geographical and geological conditions: Arcadia and the east are almost entirely continental while the western parts are subject to maritime influences; the climate is purely Mediterranean along the coasts, but the centre has a relatively continental climate. In 1991 the population was 1,086,935, which is 10.59 per cent of the total population of Greece. It has been estimated that the civic population in 400 BC may have been 500,000 or 600,000.

The topography is complex. The north consists entirely of highland, from the lower mountain chains of the Argolid peninsula westwards successively through Cyllene (Ziria), Chelmos, Panachaicum, and to the south Erymanthus and Maenale towards the centre, all with extensive areas above 1500 m. Three chains run southwards from this mass, the lowest to the west beginning with Lykaion and running through Ithome to form the Messenian peninsula; Taygetus in the centre, with the highest summit of the Peloponnese (2409 m) forming the peninsula now called Mani, running to Cape Taenarum (Matapan); and Parnon to the east, running to Cape Malea. These parallel chains once formed part of the huge arc stretching from Albania through central Greece and Crete to Asia Minor. This original system was destroyed by the subsidence which created the large gulfs and most of the plains in the interior. In the Isthmian province and Argolid, as in the eastern parts of central Greece, the predominant direction of the ranges is west to east. The western and southern divisions of the Peloponnese are characterized by larger plains, forming a kind of counterweight to the smaller, closely enclosed plains, as around Tripolis, Mantinea and Arcadian Orchomenus, Pheneus, and Stymphalus. Along the north and west coasts are well-watered and well-drained terraces, the uplifted remnants of earlier coastal plains.

The eastern coastal plain, known as the Argolid, is dominated by the citadels of Argos and Mycenae. The fertile coastal strip in the north is divided into Corinth in the east and Achaea in the west; it includes Patras, the important port city and centre of tourism and the wine trade. The monotonous plain of Elis (Ilia), which extends down the west coast, is partially composed of the alluvium deposited by the river Alpheus. The southern coast is split into three promontories, the largest of which, Mani, is an extension of the Taygetus massif. Taygetus is flanked by Laconia round Sparta and Messinia round Kalamata. Both are alluvial plains and are free from winter frost.

In spite of its being a virtual island and with deeply indented gulfs between the mountain chains providing some good harbours, the Peloponnese had little communication with the sea. Arcadia, which is the most central of the regions, and whose pasturelands were 600–800 m above sea level, did not touch the sea at all and was nearly inaccessible. The Peloponnese had relatively few harbours and little or no hinterland except in the Argolid and Elis. Consequently, naval operations against the coast were rendered more difficult: hence the importance of Halieis for Athens and Argos during their alliance in the mid-5th century BC, and of Pylos and Methone. The capes were all dangerous, Malea notoriously so, as attested by authors belonging to different periods, such as Homer and Thucydides. The importance of Tiryns and Mycenae in Bronze Age Greece may have been due to the existence of an "isthmus" route from the Gulf of Argos to Corinth. Following the destruction of Tiryns and Mycenae, Argos began to develop and in the 7th century BC reached its peak as one of the most powerful cities in Greece.

The name Peloponnese does not appear in Homer, who knows the entire peninsula by the name of Argos, one of its well-known Mycenaean city states. The name is first attested in the *Cypria* (fr. 11, Allen), a poem belonging to the Trojan epic cycle and now preserved only in fragments. The next known occurrence is in the Homeric *Hymn to Apollo*. The philosopher Anaxagoras saw in it an appropriate unit to measure the size of the sun. The geographer Strabo, writing during the reign of the Roman emperor Augustus, devotes a considerable portion of his eighth book to the Peloponnese. During the latter part of the second millennium BC Mycenaean civilization flourished at centres such as Mycenae, Tiryns, and Pylos. The commercial and cultural influence of Crete, if not the political and military, began to be felt during the later part of the Mycenaean period, as shown by the Minoan-influenced design and decoration of palaces at Tiryns and Mycenae, and the impact of Minoan art revealed in the later shaft graves.

In historical times the Peloponnese consisted of six divisions: Achaea, Arcadia, Argolis, Elis, Laconia, and Messenia. These were separated from one another by mountains, and this fact hindered intercourse between them by land. Thanks largely to the landscape these regions maintained their identity throughout antiquity. Thus Elis was the region of the Alpheus plain and adjacent coasts. Achaea was made up of the steep northern valleys, their outfalls, and the coastal strip. Arcadia consisted of the central mountains and basins including the plain of Megalopolis. Messenia consisted of the southwestern peninsula and the Pamisus plain, while Laconia comprised the Eurotas valley and the southeastern peninsula. Corinth controlled the isthmus and its neighbourhood, while Argos dominated the plain. The Peloponnese was the home of several very powerful ancient city states, foremost among which were Sparta and Corinth. The decline of Greece's golden age has been traced to the Peloponnesian War (431–404 BC) fought between two factions led by Sparta and Athens, and admirably chronicled by Thucydides. The ensuing period was covered by Xenophon in his *Hellenica*. The complex and somewhat fragmentary topography may have been one factor that encouraged federalism and *sympoliteia* (union of states). The hegemony of Sparta promoted a regional solidarity, though it was never complete. Spartan domination of the Peloponnese was followed by Macedonian rule which ended with the Roman conquest of 146 BC. During the Hellenistic and Roman periods the southern coastal cities of Gythium and Methone played an increasingly important role as useful stations on long-haul east–west routes; and Methone, in particular, maintained its importance in this regard until the 19th century. It had been mentioned by Homer as being "rich in vines", and was famous for its wine and bacon under the Venetians, who built a fort to protect the shipping route around the Peloponnese.

In late antiquity the Peloponnese was part of the province of Achaea and retained its urban character: it contained 26 cities according to Hierocles. However, building activity practically came to a halt in the late 6th century AD either as a result of general decline or due to hostile invasions, primarily from the Slavs. In spite of the presence of Slavic toponyms, some of which are not beyond question, the extent of Slavic penetration of the Peloponnese is debatable. The Slavs apparently did not occupy the eastern cities which underwent rapid Hellenization. There were, however, independent Slavic communities in the peninsula as late as the 14th century.

From the late 7th century the Peloponnese constituted part of the theme of Hellas, and became a theme in its own right from the early 9th century. Its capital was at Corinth; and Leo Skleros may have been the first *strategos* (commander). Arab pirates ravaged the coasts of the Peloponnese in the 9th and 10th centuries, until Byzantium regained Crete in 961. Thereafter the region prospered with ample evidence of agricultural production, commerce, and industry in cities such as Corinth and Patras.

Although ancient geographers compared its peculiar shape to that of a leaf of the plane tree, in the Byzantine period the Peloponnese was often known as the Morea ("mulberry"). The name was first applied to the mulberry-growing northwestern district of Elis and then to the entire peninsula by the 14th century. Under the Byzantine empire the Peloponnese suffered repeated incursions by warrior tribes from the north. In the 13th century it was taken by the Franks, who held it for two centuries until it reverted to the last Byzantine emperors. In 1204 most of the Peloponnese had been taken over without serious struggle by the leaders of the Fourth Crusade, notably William I of Champlette and Geoffrey I Villehardouin. The land was divided into baronies, loosely under the authority of the principality of Achaea. By 1248 the conquest was complete, but the Frankish defeat at the battle of Pelagonia in 1259 and the surrender of Mistra and other territories by the Treaty of Constantinople in 1262 initiated the revival of Byzantine power in the Peloponnese which, from now on, was

divided between the despotate of the Morea and the various Frankish states.

The Turks first entered the Peloponnese in 1446, and by 1460 they had conquered all of it except for the Venetian strongholds of Nauplia and Methone. One of its rulers, Thomas Palaiologos, brother of the last Byzantine emperor Constantine XI (1449–53), fled with his family to Corfu and thence by himself to Italy, where pope Pius II granted him a lodging and an annual pension which he enjoyed until his death in 1465.

With independence in the 19th century the Peloponnese became part of the new nation of Greece. Patras (Patrai), the major city in modern times, located in the northern Peloponnese, has continued to grow in commercial importance since the War of Independence and is today the third largest city in Greece.

Historically, the Peloponnese is one of the most famous parts of Greece. It includes such well-known sites as Corinth, Epidaurus, Mistra, Mycenae, Olympia, and Sparta. It has the most varied ruins of ancient Greece, making it one of the best-known centres of tourism. It is therefore not at all surprising that Pausanias, in the latter half of the 2nd century AD, devotes the greater part of his *Guide to Greece* (books 2–8) to a description of the Peloponnese and its historic sites. Blessed with abundant physical beauty and replete with important archaeological sites, the Peloponnese is a land every corner of which evokes some ancient myth. Its cities, towns, and spas were important centres in antiquity and remain so to the present day.

D.P.M. WEERAKKODY

Summary

The part of the Greek mainland south of the isthmus of Corinth, the Peloponnese (or Morea) is almost an island. In the Bronze Age Mycenae, Tiryns, and Pylos were flourishing centres, as were Sparta and Corinth in the Classical period. The Peloponnesian War (431–404 BC) marked the end of the Greek golden age. The last two centuries of Byzantine rule saw a cultural revival based on Mistra. Nauplia was the first capital of independent Greece (1833–34).

Peloponnesian War 431–404 BC

The Peloponnesian War is the name given to the great conflict between Athens and Sparta and their respective allies that broke out in 431 BC and ended with the surrender of Athens in 404 BC. Warfare was not continuous: ten years of fighting (often called the Archidamian War after the the Spartan king Archidamus II, who led the first three invasions of Attica) were concluded by the Peace of Nicias in 421 BC; eight years of uneasy peace and occasional clashes followed, during which the Athenians' great Sicilian expedition was disastrously defeated (413 BC), before the peace was abrogated (also in 413) and the final phase, sometimes known as the Ionian War, began.

The Thirty Years' Peace of winter 446/45 BC, which had ended the earlier period of sporadic warfare between Athens and Sparta, had removed all Athenian footholds from the Peloponnese and the isthmus of Corinth and appeared to regulate relations between the two states for the future. But the Athenians' control of the subject allies that formed their empire was unimpaired and, when their continuing expansionism led them in 433 BC into actions over Corfu, Potidaea, and Megara that were not against the letter of the peace, but were seen by the Spartans' most influential allies, the Corinthians, as against its spirit and hostile to themselves, the Spartans decided to go to war if the Athenians did not back down (late 432 BC). Despite some busy Spartan diplomacy, Pericles persuaded the Athenians to stand firm and hostilities began in spring 431 BC, with the Spartans widening the issues by demanding that the Athenians free their subject allies (Thucydides, 1. 139).

At the start the Spartans expected to achieve their aims quickly by invading Attica, provoking the Athenians into battle and defeating them, an expectation shared, says Thucydides (7. 28), by most other Greeks. But, although they led Peloponnesian armies into Attica in five of the first seven years of the war and did a great deal of damage to Athenian agriculture, they could not draw the Athenians out to fight, an assault on their fortifications being out of the question. Meanwhile any hopes they had of challenging Athenian naval power proved groundless. Without the resources to build and man a large enough fleet, they tried to obtain Persian help, but

the Persians were not interested so long as Athenian naval power was unimpaired, and the same factor deterred Athens' maritime allies from rebelling and transferring their money and rowers to support the Spartans; in the first ten years of the war just one of them, Lesbos, revolted in 428 BC and in 427 BC learned the hard way that the Spartans could do nothing effective to help them. One area of the Athenian empire, the Chalcidice peninsula, was vulnerable to the Spartans' land power, but they were slow to exploit this advantage, despite the fact that the Corinthians had been able to send a small army to the area in 432 BC to help Potidaea and that the Potidaeans did hold out under siege until winter 430/29 BC, while other smaller rebels nearby were never subdued. Eventually in 424 BC Brasidas did take a force to Chalcidice and, despite having only 1,700 hoplites, who were volunteers and liberated helots, won over a number of the Athenians' allies and their substantial colony at Amphipolis.

The Athenians' unassailable fortifications and their dominant fleet kept them safe from immediate danger provided that they avoided major battles on land, but, despite Pericles' public confidence in their financial strength (Thucydides, 2. 13), they were not adequately funded for a long war. It is possible that Pericles, who evidently directed their strategy, planned to use the fleet for offensive operations and that the attack he led on Epidaurus in spring 430 BC was the beginning of them, but the onset of the plague at that moment put an end to any such notions. Lasting two and a half years, its severity was exacerbated by the congestion caused by refugees from the countryside, where the longest of the Peloponnesian invasions, lasting 40 days, was in progress, and it seems that overall the Athenians lost from it up to a third of their fighting men. In the short term their war effort was brought to a standstill and they unsuccessfully sent envoys to Sparta to negotiate terms for peace, before Pericles rallied them; he himself died of the plague in autumn 429 BC and thereafter, in Thucydides' view (2. 65), his steadying influence was sorely missed. The Spartans, however, failed to exploit the Athenians' difficulties and their recovery was spirited. They reacted vigorously to the revolt of Lesbos in 428 BC, raising 200 talents from the first ever property tax on citizens, and crushed it the following spring.

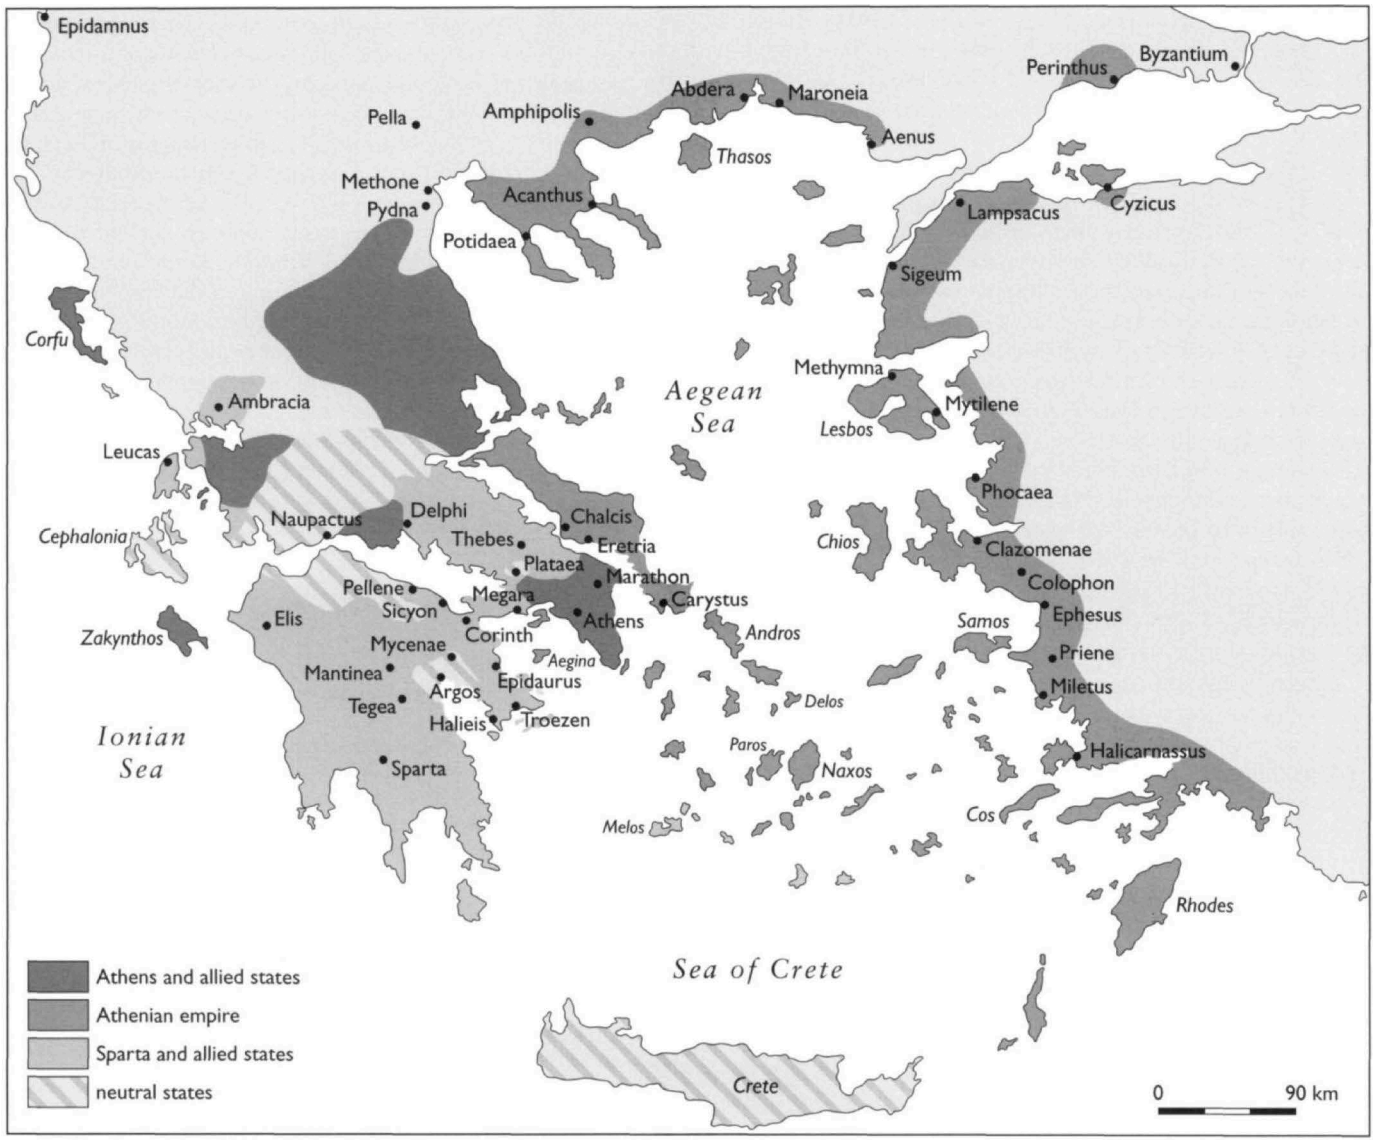
After some small-scale offensive operations in 427 and 426 BC, including the dispatch of 20 ships to support their allies in Sicily against the Syracusans, in the summer of 425 BC the Athenians won a major victory near Pylos in the southwest Peloponnese. A fleet of 40 ships en route for Sicily was used by the enterprising general Demosthenes to fortify a small peninsula. A Spartan attack on the fortifications failed, the Spartan fleet that entered the bay was defeated, and a Spartan force that was put on the island of Sphacteria at the bay's entrance was cut off. The Spartans thereupon obtained a truce, so that they could send envoys to Athens about peace, and were evidently ready to ignore the interests of their allies on whose behalf they had claimed to go to war, in order to remove the Athenians and rescue their men. The Athenians, however, prudently demanded the concession of footholds on the isthmus and on Peloponnesian coasts that they had held before 446 BC as a guarantee that the Spartans would not renew the war within a few years once they had surrendered their advantage, and negotiations broke down. The Athenians then kept the Spartan ships that had been given as surety for the truce and later stormed Sphacteria, taking prisoner 292 hoplites, whom they held in Athens as hostages against any further invasions of Attica. Early the following summer (424 BC) they captured the island of Cythera, off the south coast of Laconia, and, using it and Pylos as bases for ravaging Spartan territory and as refuges for Spartan serfs, they had high hopes of victory; to pursue this, the previous winter they had decided to increase their revenue from their allies to about three times the prewar figure.

At this point, however, things went wrong for the Athenians. First, their 60 ships returned from Sicily unsuccessful after the Greek cities there had made peace with one another. Then an attempt to win over Megara, whose territory they had raided regularly since 431 BC, failed. This setback was not disastrous, but in the autumn an ambitious attack on Boeotia ended with a defeat in a pitched battle near the frontier close to Delium in which 1000 precious hoplites were lost. By this time Brasidas' small army had reached Chalcidice and was winning over allied cities, and, when he had crowned these successes with the capture of Amphipolis, the Athenians agreed to conclude a one-year truce (spring 423 BC). Although it did not lead, as the Spartans hoped, to a permanent peace, there was little fighting in southern Greece when it expired. The Athenians concentrated on trying to recover lost allies in Chalcidice; first Nicias and then Cleon had some success, but, when the latter was defeated and killed in a battle outside Amphipolis, in which Brasidas also perished, they too were ready to compromise.

The treaty as agreed in spring 421 BC, the Peace of Nicias, provided *inter alia* for the return of prisoners, the withdrawal of the Athenians from Pylos and Cythera, and the restoration to them of Amphipolis and their revenues from Chalcidice, but its terms were never fully implemented. The Athenians gave back the prisoners from Sphacteria, but, because the Spartans could neither force the Amphipolitans to return to their control nor persuade other important allies, including Corinth and Thebes, to ratify the treaty, they kept Pylos and Cythera. In a flurry of diplomatic activity, which led to some renewed warfare, it looked at one time as if Sparta and Athens might combine against the former's allies; and then that the Spartans might be defeated by a combination of the hitherto neutral Argives and other disaffected allies, Elis and Mantinea, backed to some extent by Athens; but the Spartans won a crucial battle near Mantinea in 418 BC and recovered the leadership of the Peloponnese, although the Argives remained allies of Athens.

Athenians had fought at Mantinea, but the peace remained in force with neither side eager to resume full-scale war. Nevertheless, the Athenians were still restless and, disinclined to do the hard work necessary to recover Amphipolis and their control of the north, their thoughts turned to Sicily, where, according to Thucydides (3. 86 and 4. 65), they had had conquest in mind when sending the ships in 427 and 425 BC. In the spring of 415 BC, lured by an appeal from non-Greek Segesta, they voted to send a fleet of 100 triremes and an army to the island under Nicias, Alcibiades, and Lamachus in the hope that they would conquer it and use its resources to achieve final victory over the Spartans at home.

Despite a slow and indecisive start, the recall of Alcibiades to face a charge of sacrilege and the death in battle of



28. Alliances at the start of the Peloponnesian War, 431 BC

Lamachus, the Athenians in summer 414 BC were about to put Syracuse under siege and it seemed likely to surrender, but the arrival of Gylippus, sent out by the Spartans, on the advice of the exiled Alcibiades, to organize the city's defence, turned the tide and in the winter the Athenians became more besieged than besiegers. Nicias recommended the recall of the expedition, but the people at home preferred to send substantial reinforcements (spring 413 BC). This was to no avail, because the Athenians failed to regain the initiative and, with the Syracusans establishing naval superiority and Nicias unwilling to agree to withdrawal without the people's approval, the whole force was destroyed.

This defeat was catastrophic for the Athenians, not only for the losses of men, ships, and money, but also for its consequences in the Greek homeland. The Spartans had already declared the war renewed and established a garrison at Decelea in northern Attica that served as a base for year-round ravaging and a refuge for some 20,000 slaves over the remaining years of the war. They now began to send fleets into the Aegean, where the destruction of Athens' naval power was encouraging its allies to revolt and the Persians to intervene in the hope of recovering control of the Asiatic Greeks.

The Athenians, however, despite internal discord, fought back, matching the Spartans almost ship for ship, limiting the revolts of allies and recovering some cities, while the Persians restricted their commitment to intermittent financial backing of the Spartan navy, even when in winter 412/11 BC the western satraps guaranteed their support in a treaty in which the Spartans recognized the Persian king's right to rule over all the Asiatic mainland. The Athenians indeed survived a short-lived oligarchic revolution in the summer of 411 BC and their fleet, which had remained loyal to democracy and had shrewdly accepted Alcibiades back from exile to join its leaders, won two battles, in the second of which, off Cyzicus in the Propontis (Sea of Marmora) in the summer of 410 BC, all the Spartan ships were destroyed or taken.

A Spartan peace offer was now rejected and the Athenians pressed on with the recovery of lost allies, but the process was incomplete in 407 BC, when the arrival in the eastern Aegean of a competent Spartan admiral, Lysander, coincided with the

Persian king's appointment of his son Cyrus to take charge in the west and make effective his support of the Spartans. Lysander's victory at Notium led to Alcibiades' withdrawal into exile, an indication of continuing dissension at Athens. This again showed itself in 406 BC, when, after the Athenians had defeated Lysander's successor off the Arginusae islands, eight of their victorious generals were prosecuted for failing to pick up the survivors in a storm and six of them were executed. Then in 405 BC Lysander was restored to the command, lured the Athenian fleet into the Hellespont (Dardanelles), and in a surprise attack took 170 of their 180 ships almost without a fight, as they were beached for the night near Aegospotami. It was the decisive blow. Up to this point the war could still have ended in stalemate or even victory for the Athenians, but these were their last ships and now Lysander cut their corn-supply lifeline, took over their allies, and expelled their colonists from the Aegean and then joined in the siege of Athens, which ended inevitably in surrender (spring 404 BC). Some of the Spartans' allies wanted Athens destroyed, but Sparta was content to reduce the Athenians to the status of a subject ally, with most of their fortifications demolished and, soon after, their democracy replaced by a repressive pro-Spartan oligarchy.

The war has always been seen as a turning point in the history of ancient Greece. Both protagonists, the victors as much as the vanquished, were irremediably weakened. A serious shortage of manpower combined with defects of character and judgement to bring down the Spartans' new Aegean empire within ten years and only Persian support enabled them to keep their control of the Peloponnese as far as 370 BC. The Athenians recovered remarkably and briefly were again the leading city, but they lacked not only the wealth, but also the vigour and dynamism of their 5th-century BC ancestors. Neither of these states nor the Thebans, whose strength and confidence grew significantly during the war, could effectively unite Greece against the expansion of Macedonian power under Philip II. In 338 BC he defeated the combined army of Athens and Thebes at Chaeronea and then could afford simply to ignore the Spartans' refusal to join in his settlement of Greek affairs.

This was certainly a sorry episode in Greek history not only for the long-term damage it inflicted on Greek freedom, but also for the extremes of cruelty practised by some of its participants. In 427 BC the Spartans killed all the surviving defenders of Plataea, an ally of Athens, when they surrendered; in 421 BC the Athenians did the same to Scione, a rebellious ally; and in 416 BC, during the formal period of peace and following no known act of recent hostility by the victims, they attacked Melos and on its surrender killed all the men of fighting age and sold the rest of the population into slavery; in 413 BC the Syracusans butchered many defenceless Athenians in the final disaster and sent the rest to the stone quarries. Other atrocities were committed when within cities the partisans of the two protagonists clashed in bitter civil strife (*stasis*), most notably at Corfu in 427 BC.

In contrast to these barbarities were the admirable doggedness and heroism of the defenders of Plataea (429–427 BC) and especially the remarkably resilient spirit of the Athenians that enabled them to recover from the plague of 430–428 BC and the Sicilian disaster of 413 BC. Remarkable too were their continued public patronage and enjoyment of art and drama through the times of crisis right to the end. The Erechtheum on the Acropolis was built during the war and many of the surviving tragedies of Euripides, some of those of Sophocles, and 9 of Aristophanes' 11 extant comedies come from these years, performed at public festivals at public expense. The war, however, provided the essential comic situations of Aristophanes' *Acharnians* (425 BC), *Peace* (421 BC), and *Lysistrata* (411 BC), and the tragic consequences of warfare were vividly echoed in Euripides' *Troades* (415 BC) and *Hecuba* (*c.* 424 BC). But its greatest contribution to the development of the Hellenic tradition was in inspiring Thucydides to write his history. With his strict sense of relevance and careful collection and treatment of information he set standards of objectivity and scientific analysis that no other ancient historian, Greek or Roman, could match, while at the same time being a master of dramatic narrative and at conveying the tragic quality of history.

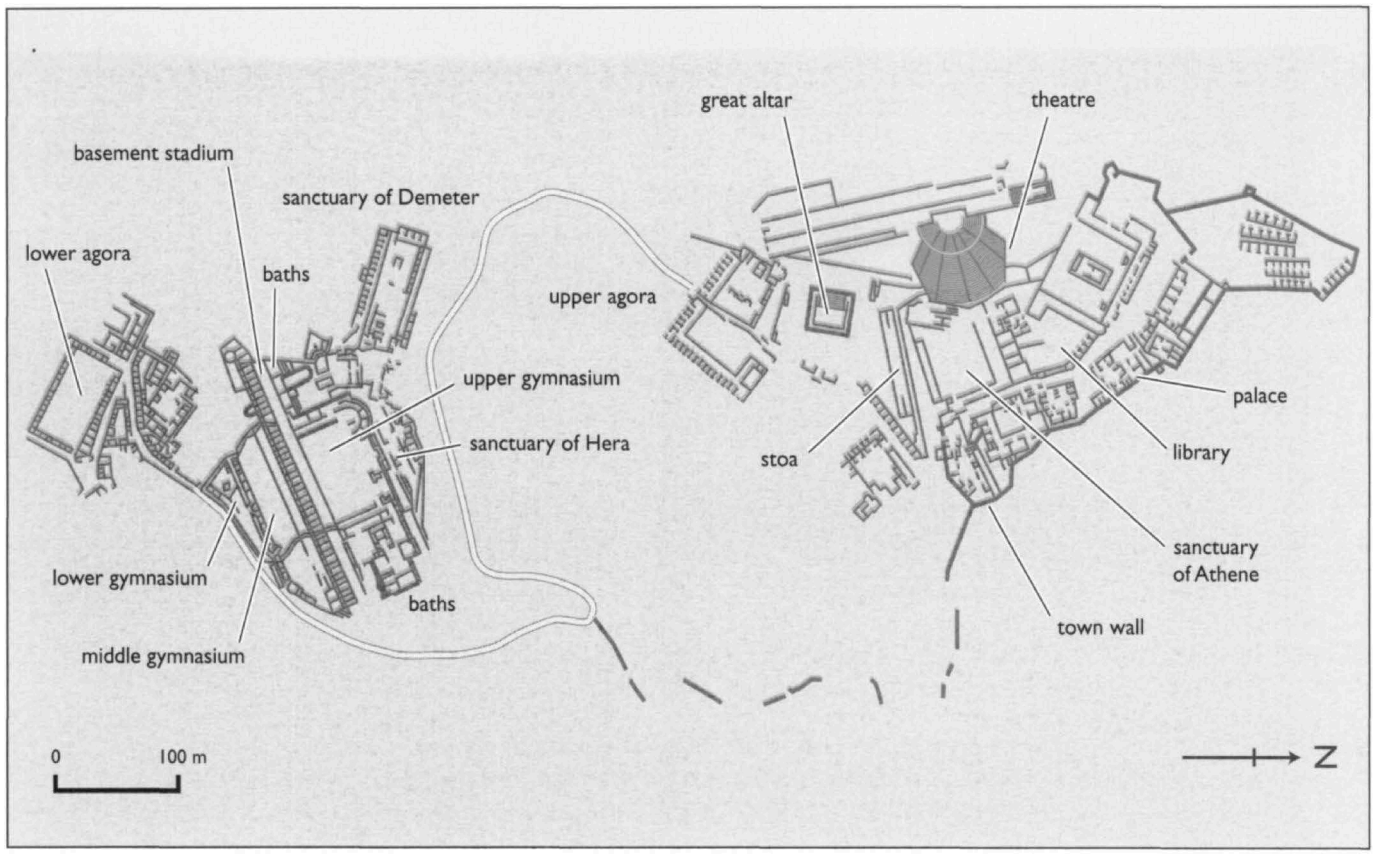
Pergamum

City in northwest Asia Minor

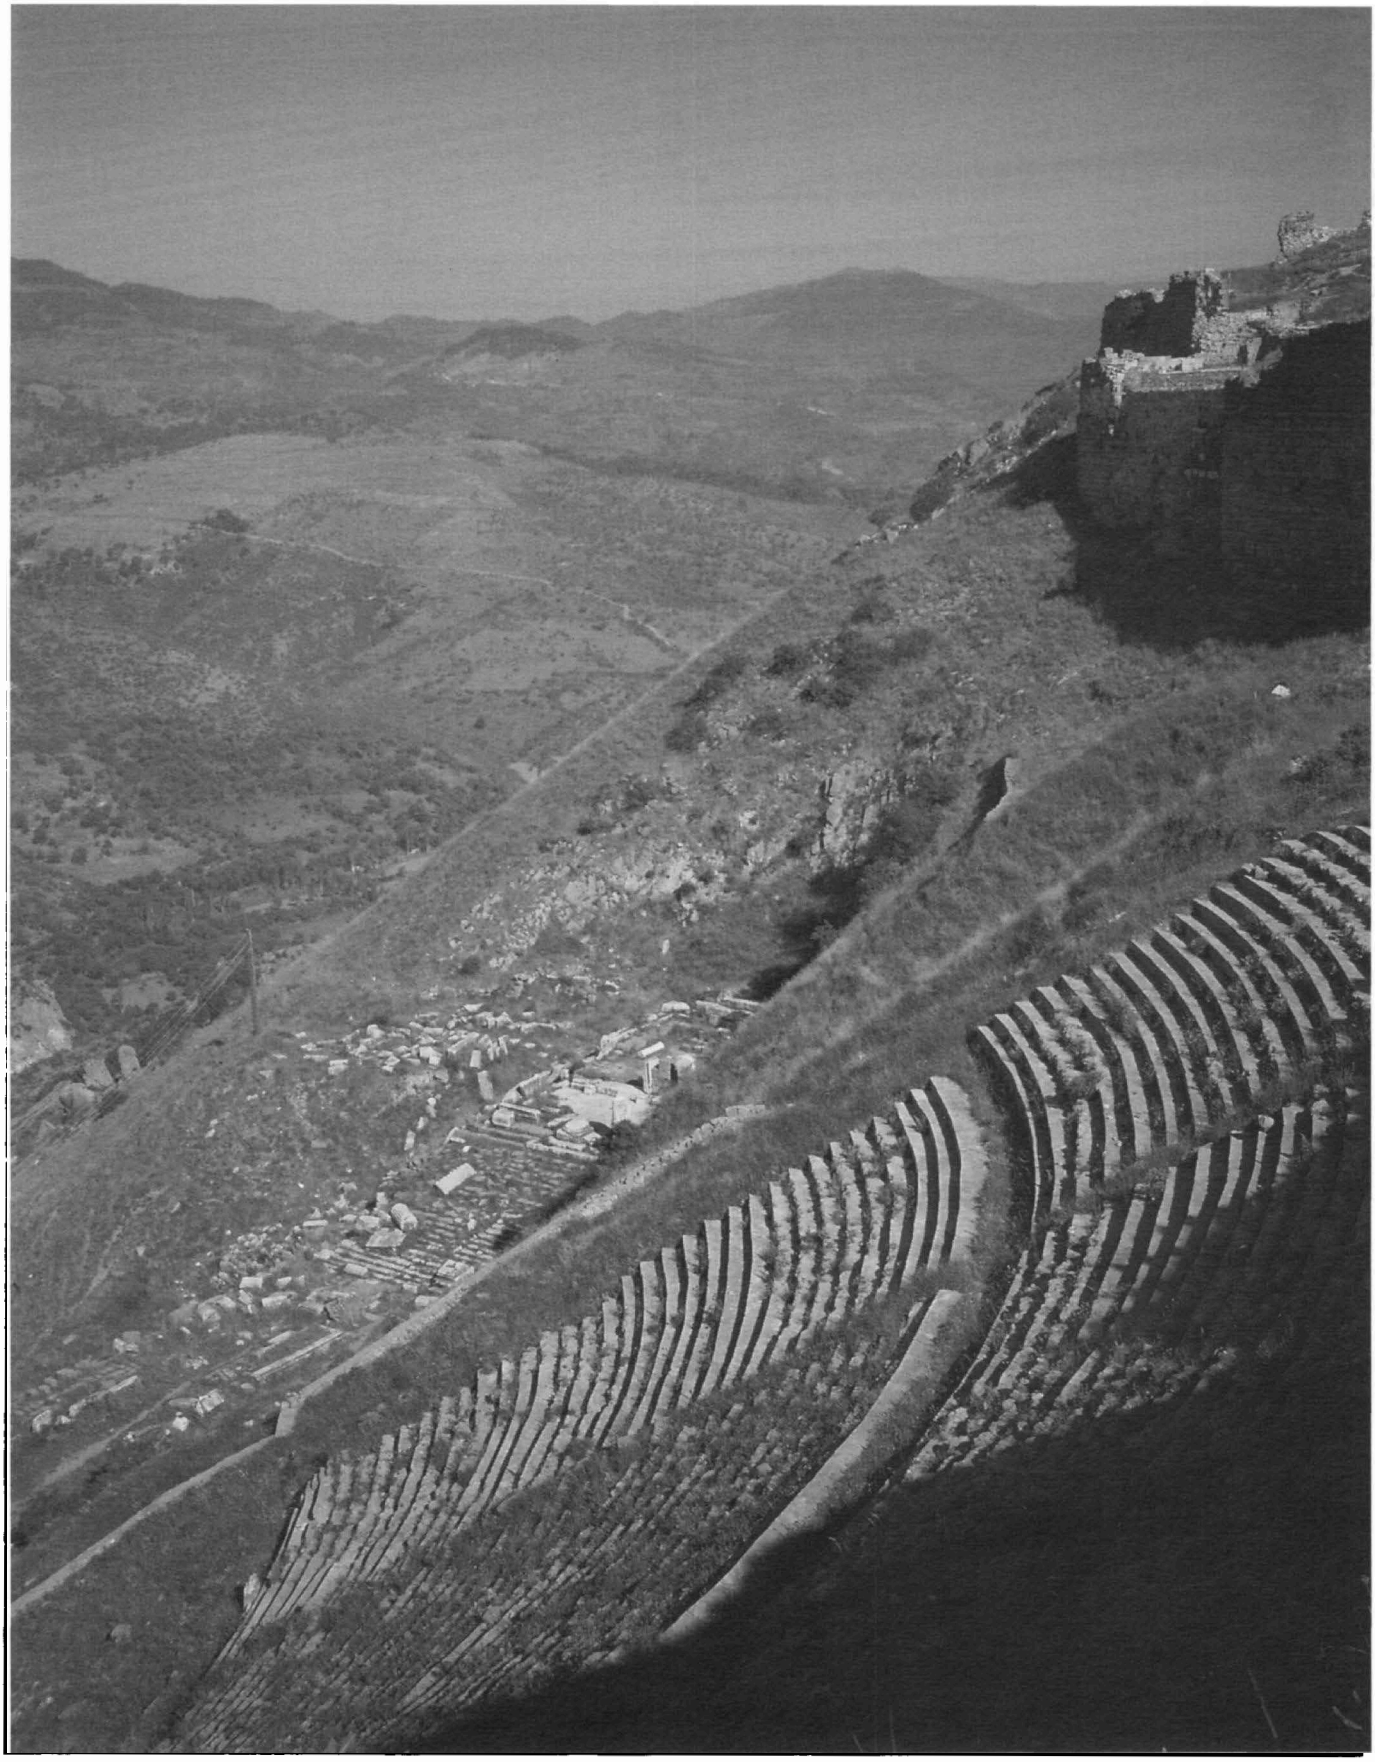
Pergamum was the elegant capital of the Hellenistic kingdom of the same name that was founded by the Attalid dynasty in



29. Pergamum

the early 3rd century BC. The city, in the region of ancient Mysia in northwestern Turkey, was *c.*20 km from the sea and was connected to its port at Elaea by the Caicus river. Pottery sherds show that there was Greek settlement at this site as early as the 8th century BC; in the early 5th century BC when the territory was under Persian control its governor was a Greek from Eretria. After the conquests of Alexander the Great in the late 4th century BC, Lysimachus, one of Alexander's successors, took Pergamum as part of his kingdom. He deposited a sizeable portion of his royal treasury there under the care of his general Philetaerus. In 281 BC Lysimachus was killed in battle, and Philetaerus, seizing the moment and the treasury, installed himself as ruler of the new kingdom of Pergamum and founder of the Attalid dynasty. With Athens having been in decline since the 4th century BC, the Attalids set as their goal the preservation of Classical civilization and Pergamum was to be a new Athens, the centre of Greek culture and art. During the reign of the fourth Attalid king, Eumenes II (197–159 BC), Pergamum was transformed from a modest Greek city into a magnificent Hellenistic metropolis with a population of more than 100,000 people. When the last king, Attalus III, ceded his estates to Rome in his will in 133 BC, Pergamum became the capital of the Roman province of Asia. The city continued to grow under the Romans and, at its peak in the 2nd century AD, the population was about 150,000.

The site is divided into two areas – a lofty acropolis (*c.*400 m high) and the plain surrounding it. Remains of numerous public buildings and private houses are found in both areas. The walled citadel was terraced from north to south providing building levels that were connected by a winding road. With the exception of a few andesite structures, the view from the plain was of white marble Hellenistic and Roman buildings rising one above the other. At the summit, an aqueduct supplied water that was piped to public fountains, baths, and private dwellings. Nearby were military barracks, storerooms, a large temple honouring the deified Roman emperor Trajan (AD 98–117), and the "palaces" of the Attalid kings, which were merely large peristyle houses. On the second terrace was the sanctuary of Athena, honouring the patron deity of the city, which contained a small 3rd-century BC andesite Doric temple surrounded by spectacularly carved 2nd-century BC marble stoas. The north stoa provided access to the renowned Pergamene library. Behind the library and the Athena sanctuary, built into the steep southwest face of the citadel, is the precipitous theatre (it has the steepest *cavea* of all Greek theatres), with seating for 10,000 persons. The area at the base of the theatre is so narrow that the wooden stage building was removed when not in use so that it would not impede pedestrian movement. On the third terrace is the foundation of the Pergamum Altar (*c.*165 BC), arguably the most spectacular of all monuments from the Hellenistic period. This large square marble structure (*c.*35 × 35 m), which has been partially reconstructed in the Berlin Museum, consisted of a tall podium adorned with over-lifesized figures in very high relief depicting the Battle of the Gods and the Giants. A broad staircase led up to an Ionic peristyle court behind whose columns was a lengthy relief showing the life of the hero Telephus, mythic founder of Pergamum and adopted ancestor of the Attalids. The function of the "Altar" has been debated since its excavation in the late 19th century. Is it an altar, a victory monument, a dynastic



Pergamum: the Hellenistic theatre with seating for 10,000. It has the steepest cavea of all Greek theatres.

monument, or a *heroon* (i.e. a cult building for the worship of a hero)? The monument is in the form of a sacrificial altar (although it is much larger than all other examples) and the sculptural themes can be related to Attalid military victories and the political achievements of the dynasty. The lengthy relief telling the story of Telephus suggests most strongly, however, that its primary function was as his *heroon* (Webb, 1998). Among the remaining buildings on the terraced citadel are the *heroon* of the deified Attalid kings and several large complexes including the upper market or agora, the sanctuary of Demeter, the sanctuary of Hera, three gymnasia, large public baths, and the lower agora. There were also private houses, individual shops, small public baths, workshops, a tavern, and other establishments important to everyday life. At the base of the citadel was the main gate in the city wall.

The city in the plain was built primarily in the Roman period and contained a stadium, an amphitheatre seating 50,000, a theatre seating 30,000, various smaller public buildings, houses, tombs, and the vast temple of the Egyptian gods. From the area of the theatre a colonnaded street led to the famed healing centre, the sanctuary of Asclepius. The cult at Pergamum, founded in the 4th century BC, experienced continuous expansion and by the 2nd century AD the Asclepieum was the principal healing centre in Asia Minor. Medical treatment incorporated physical therapies, e.g. diet, exercise, baths, etc., but also spiritual procedures, e.g. incubation (dream therapy). The huge complex consisted of a large colonnaded court around and within which were temples, a library, a theatre seating 3500, fountains, pools, men's and women's latrines, sleeping rooms for incubation, and a large treatment building.

Pergamum declined as the power of the Roman empire waned in the 3rd century AD. The buildings on the lower acropolis, in the surrounding plain, and the sanctuary of Asclepius were abandoned with the exception of the temple of the Egyptian gods, which was converted into a Christian basilica. The upper acropolis continued in use, but comprised mostly modest houses built into and over the ancient structures. The city suffered severe damage from foreign invaders on a number of occasions, and the upper acropolis was refortified at least three times – in the 3rd, 7th, and 12th centuries. Even though Pergamum was home to one the "seven churches" of Asia Minor (Revelation 1: 11), was a major intellectual centre until the end of the 4th century, and was made a bishopric at the end of the 14th century, it had a small population and was relatively obscure throughout the Byzantine period. When the future emperor Theodore Laskaris visited the site in the mid-13th century, he recalled the greatness of the ancient city and equated the contemporary poorly constructed dwellings that lined the narrow streets to mouseholes in houses.

While the city of Pergamum as a whole was the glory of the Attalids, and the Pergamum Altar is the most important structure for modern admirers of the dynasty's accomplishments, the building that was central to Pergamum's role in the preservation of Classical civilization was the library. Second only to the library at Alexandria in the ancient world, it is estimated to have owned 200,000 volumes. Since the kings supported scholars in all the academic disciplines, one can assume that the holdings consisted of works representing the entire range of Greek learning. It is not clear what eventually happened to the contents of the library. In his *Life of Mark Antony* Plutarch relates a story that Antony gave the entire collection to Cleopatra as a gift. But Plutarch himself is unsure of the story's veracity, and there is no evidence that it is true. Since Pergamum continued as a centre of scholarly pursuits for four centuries after the deaths of Antony and Cleopatra, it is likely that at least a portion of the ancient collection remained intact during that period. In connection with the development of the library, Pergamum was also famous for the production of parchment, which eventually replaced papyrus as the preferred writing material in antiquity. Contrary to Varro's account (Pliny, *Naturalis Historia*, 13. 70), the Pergamenes did not invent parchment, for treated animal skin was used as a writing material very early in the Near East, and Herodotus (5. 58) mentions that it was used by the Ionian Greeks in the 6th century BC (Finegan, 1959, pp. 390–99). It is likely that Pergamum's reputation was based on the fine quality and large quantities it produced not only for consumption at home but also for export to Rome. The increased use of parchment facilitated the development of the more convenient and accessible codex (paged book), which supplanted papyrus and parchment rolls by the 4th century AD.

See also Attalids

Summary

Pergamum was the capital of the Attalid kings who controlled much of western Asia Minor in the 3rd and 2nd centuries BC. The city was a major centre of Greek culture and art. In 133 BC it became the capital of the Roman province of Asia. The library at Pergamum, along with that at Alexandria, owned the most important collection of Classical Greek works in the ancient world. Pergamene production and dissemination of fine-quality parchment facilitated the development of the more convenient codex book format.

Pericles *c.*492–429 BC

Athenian statesman

Pericles was born around 492 BC. His mother's family, the Alcmaeonidae, had been prominent in Athenian politics throughout most of the 6th century BC. His maternal great-uncle Cleisthenes held the office of eponymous archon in 525 BC. The family spearheaded efforts to overthrow the tyranny held by Pisistratus' sons. That accomplished, Cleisthenes "took the common people into his political coterie" (to paraphrase Herodotus) and reformed the constitution.

Pericles' father Xanthippus was a hero of the Persian Wars. He showed himself to be firm, even ruthless, in siege operations against a Persian garrison at Sestos on the Hellespont. Earlier in his career he had prosecuted Miltiades, a prominent member of a rival family, and very nearly got him condemned to death. This antagonism between the two families was to continue into the next generation.

If we are to believe Plutarch, a certain shyness, a degree of social reticence, seems to have been one trait of Pericles' personality. For his entry into the public sphere Pericles acted as *choregos*, financial backer, for Aeschylus' drama about the Persian Wars, *Persians* (472 BC). Although Themistocles is not named, his spirit pervades the play. Themistocles had shrewdly foreseen the importance of maintaining an effective fleet of warships, and he persuaded the Athenian voters to forgo a one-time dole so that such a fleet could be built. Pericles was later to make maritime invulnerability the cornerstone of Athenian policy.

Pericles' first serious political opponent was Miltiades' son Cimon. As a general and public figure he garnered personal support through private largesse and especially by using war booty to improve the city's appearance and amenities. From him Pericles appears to have learned that such benefactions were a sure way to win votes.

Cimon was by disposition conservative and had a personal affinity for things Spartan. After a stunning series of victories against the Persian forces he made two serious mistakes. He laid himself open to charges of mismanagement after completing a lengthy campaign to bring a powerful rebel state, Thasos, back into the alliance. Pericles was among Cimon's prosecutors, but the attack failed (463 BC). Sparta was also reeling from the aftermath of an earthquake. Its numerous subject class, the helots, had revolted and the Spartans called on the Athenians for help. Cimon led a large Athenian force to aid Sparta, Athens' "yokemate", as he termed it, but when these troops were inexplicably sent away, the people's anger turned against him and he was ostracized, that is, obliged to leave Athens for a ten-year period. Pericles and a political associate, Ephialtes, saw their chance to carry out a reform of the senior judicial council at Athens, the Areopagus. This reform signalled a change in the direction of Athenian politics: from now on more power was to be wielded by the common people, and probably at this time the ordinary citizens who sat on the numerous Athenian juries were given a stipendiary daily allowance for the days when the courts were in session.

Athens' foreign policy suffered a serious setback in 454 BC. A revolt by a Libyan prince from the Persian empire failed, and two separate Athenian and allied support expeditions were lost. If Pericles supported the venture, the debacle appears not to have been brought up against him. During this period he was also taking careful note of the successes of other prominent Athenian commanders, such as Myronides and Tolmides. In 455 BC the latter led an Athenian naval force around the Peloponnese, and won some important victories. Not to be outshone, a few years later Pericles led a similar force that tried with only limited success to establish an Athenian presence in northwest Greece. Pericles may also have learned from Tolmides the advantages to be gained from the system of "cleruchies", pockets of Athenian settlers sent out to troublespots to prop up Athens' interests. In 451 BC Pericles sponsored a measure to restrict Athenian citizenship to those who could prove that both their mother and their father were citizens. What Pericles hoped to achieve by this measure is uncertain.

By the mid-5th century BC Pericles had a clearly formed vision of Athens as head of a maritime empire so powerful that the Spartans would have to concede superiority to the Athenians. His ambitions were fuelled by the huge financial surplus in the treasury of the Delian League, since 454 BC (probably) housed in Athens. Against strident opposition from such conservatives as Thucydides, son of Melesias, who was possibly related to Thucydides the historian, Pericles proposed that some of the money should be diverted to pay for an extensive building programme. The sources name Pericles himself in connection with a few of the projects, especially the statue of *Athena Parthenos* ("the Maiden"), executed by the Athenian sculptor Phidias, and an elaborate new odeum, a music hall that abutted the theatre of Dionysus, and it seems clear that he was the driving force behind the whole enterprise. These vast public works were intended not only to beautify Athens but also to give employment to its people. An estimated two to three thousand individuals were continuously employed over a period of 16 years, from 447 BC to the outbreak of the war with the Peloponnesians in 431 BC.

Some ancient sources assert that a formal peace was concluded between Athens and its allies and the king of Persia. A formal treaty around 449 BC would make it easier to explain the freedom that Pericles felt in applying to the building programme funds collected for military purposes. On the other hand, several ancient authorities claimed that the inscription purporting to record the peace was a forgery. Whatever the truth of the matter, there was a cessation of hostilities after some important successes against the Persians around 450 BC by league forces under Cimon (now returned from ostracism), so that Pericles would not have been taking a great risk in redirecting part of the league's war chest to other purposes.

In 449 BC or 448 BC the Spartans launched a "Sacred War" to defend (as they claimed) the Delphians' claims to be supervisors of Apollo's shrine. Pericles responded with a counterexpedition that restored control to the original claimants, the Phocians, with whom Athens had entered into an alliance some years before. Inscriptional and other evidence suggests serious disaffection among the allies, especially in Ionia, in the late 450s BC. In every case Athens was quick to react, by armed intervention and other means. Although the sources do not connect Pericles' name directly with any of these measures, there can be little doubt that he was prepared to take all necessary steps to see that the allies were kept tightly under Athens'

Pericles, elected ruler of Athens during the city's golden age. Roman copy of a Greek original, Vatican Museum

control. In 446/45 BC two important nearby states, Megara and Euboea, rebelled. Pericles responded with quick military action and both revolts were quashed. A Peloponnesian force that had advanced as far as Eleusis to lend support to the rebels returned home without having accomplished anything, and in the upshot a treaty of peace for 30 years was signed between the two superpowers: Athens repudiated claims to certain areas in the Peloponnese and Acarnania in northwest Greece, and in effect agreed to extend its empire only by sea. A sop had been thrown to the Spartan Cerberus, but it was becoming increasingly clear that it would not remain permanently quiescent.

In 440 BC Athens' powerful island ally Samos revolted. Again, Pericles' response was quick and tough. After several naval engagements and a protracted siege, the rebels were brought to heel. One of Pericles' colleagues for the first year of the campaign was the dramatist Sophocles, and several anecdotes survive of the shared command. Samos' longterm rival, Miletus, had figured in the preliminaries to the war, and this gave the gossipmongers and the comic poets a golden opportunity to spread the report that Pericles had got Athens involved as a personal favour to his mistress, Aspasia, who had originally come from Miletus; he had been in a relationship with her for some years after his own marriage to an aristocratic lady, not named by our sources, had broken down. By Aspasia Pericles had an illegitimate son, Pericles the Younger.

By the early 430s BC war between Athens and Sparta and their respective allies appeared inevitable. Athens responded to various provocative incidents with increasing firmness, and Pericles himself threw down the gauntlet with one or more decrees intended to cripple commercially the neighbouring state of Megara, an erstwhile ally of Athens but whose culture and language linked it firmly with Dorian Sparta. The Spartan side voted for war in the spring of 432 BC and invaded Attica a year later. Pericles himself survived the war's outbreak by only two years, succumbing in the autumn of 429 BC to the effects of a plague of a now unspecifiable type. Pericles' own strategy of defence was partly to blame. He persuaded the Athenians who lived in the countryside – a substantial portion of the populace, according to Thucydides – to move to the city and refuse any challenge to a land battle. Such an encounter would inevitably be to the advantage of the Spartans, who had a near-perfect record in infantry fighting. Although the Athenians did not abandon Pericles' defensive strategy, out of intense frustration at their sufferings they briefly removed him from the generalship, only to reinstate him shortly afterwards. With a break of only a few years after 421 BC, when a peace treaty between the combatants was nominally in effect, the war dragged on until the Athenians had to witness not only defeat but the humiliation of looking on as their fortifications were dismantled by a Spartan occupying force in 404 BC.

The sources make out Pericles to have been a competent and popular general, but probably not a brilliant one. He had rivals, generals such as Tolmides and Myronides, whose achievements might have become part of the permanent record had they had their own eulogists, and he had colleagues in the generalship, men such as Hagnon and Phormion, in whose selection Pericles perhaps had a hand and on whose abilities and loyalty he knew he could rely. But the real reasons for Pericles' enormous popularity – he was reportedly re-elected to the generalship continuously from about 443 BC until his death – was that he had a vision of Athens' potential for greatness and he knew how to achieve it in practice. He possessed outstanding oratorical skills, a speaker on whose lips, to paraphrase the comic poet Eupolis, a kind of persuasiveness settled enabling him to outstrip his rivals like a champion runner. Above all, he was acknowledged as a man of personal and financial integrity. Plutarch crowns his praise by remarking that Pericles "did not increase the property left to him by his father by one drachma", in marked contrast to what was believed about other popular leaders. His death at a critical moment in the history of Athens was a cruel stroke, with parallels on the contemporary Athenian tragic stage.

"The Periclean age" has become a useful label for Athens in the period 460–430 BC, a time of outstanding achievement in drama, philosophy, architecture, and the plastic arts. It may be an overstatement to say that Pericles was personally responsible, but it can hardly be denied that Athens' accomplishments were due in large part to the high degree of material prosperity that control of its empire had brought to the city, to his vision of what could be achieved through wise use of public funds, and to his firm hand at the tiller of the city's affairs. His carping critics might call it a tyranny, but in fact it was responsible democratic government in which the individual most fitted to lead was given a mandate by the citizens to lead them, and for a period of sufficient duration that his best expectations of them were given the chance to be realized.

Biography

Born *c.*492 BC the son of Xanthippus and great-nephew of Cleisthenes, Pericles was *choregos* (financial backer) for Aeschylus' *Persians* in 472 BC. In 463 he was among the prosecutors of Cimon. After the ostracism and death of Ephialtes, Pericles became popular leader of Athens. His vision was of Athens at the head of a maritime empire. He instituted a vast programme of public building works. His ambitions for Athens led to the outbreak of the Peloponnesian War. He died of plague in 429 BC.

Persian Wars

The Persian Wars are usually taken to refer to the two Persian expeditions to Greece in 490 BC and 480/79 BC. They imply that a continuous state of war existed between Greece and Persia during this period, thus portraying Persia as being preoccupied with the subjection of Greece. In fact, a distinction should be made between the campaign of 490 BC, under the command of two Persians, Datis and Artaphernes, and the invasion of 480/79 BC, led by the king, Xerxes. The campaign of 490 BC should be seen as a direct reaction to the involvement of Athens and the Euboean city of Eretria in the uprising of the Greek cities of Ionia, known as the Ionian Revolt (499–492 BC); the expedition of 480/79 BC was a Persian invasion, prepared on a large military scale and led by the king himself. The term "Graeco–Persian war" would perhaps more accurately describe the military aggression of 480/79 BC.

In 499/98 BC, under the leadership of Aristagoras, tyrant of Miletus, some of the Greek cities of Ionia revolted against Persia. By the time of the Ionian Revolt, tyrannical rule in the Greek cities of Asia Minor, which were under the control of the Lydian kingdom, was already established as the favoured form of government, and it continued after the Persian conquest of Lydia in 546 BC. This was in line with the Persian policy of allowing local forms of government, language, culture, and religion of the different peoples of the empire to continue, and through this policy of political tolerance limiting resistance to Persian rule. Aristagoras had been approached by exiles from Naxos to help them regain power on the island; after having obtained the approval of the Persian king Darius I (522–486) and of Artaphernes, the Persian satrap of Lydia and brother of Darius I, he left for Naxos. If successful, this campaign would increase Persian political influence in the Aegean, and establish Aristagoras' personal standing with the king. However, after an unsuccessful siege, which lasted four months, the Persians were forced to leave Naxos, and Aristagoras, faced with the personal consequences of the failed expedition, revolted against Persia, abandoning tyrannical rule in favour of *isonomia* (equal rule), with the intention of gaining popular support from other Greek cites for his revolt. His attempts to win Spartan support for his movement failed when the Spartan king Cleomenes refused to become involved in a military conflict overseas. Only Athens and the Euboean city of Eretria offered support, sending 20 and five ships respectively. This fleet arrived in Miletus in the spring of 498 BC, and a first attack was directed against the Lydian capital Sardis. The city was successfully defended by Persians and Lydians, but when a fire broke out the city quickly burnt down. A battle near Ephesus initiated by the Persians and Lydians against the Ionians forced the Ionians to retreat to their respective cities (Herodotus, 5. 102). After this defeat the Athenians and Eretrians abandoned the revolt and returned to Greece.

Gathering momentum, the revolt now spread to cities in the Hellespont, Caria, and Cyprus. Here the rebel Onesilus was killed, probably in the summer of 497 BC, forcing the Ionian ships to leave the island. Between 497 BC and 496 BC Daurises and Hymaees, both sons-in-law of Darius I, successfully fought the rebellious cities in the Hellespont, while Artaphernes and Otanes launched attacks in Caria. Aristagoras, having lost

control over the revolt, fled to Myrcinus in Thrace, where he was killed (Thucydides, 4. 102. 2–3).

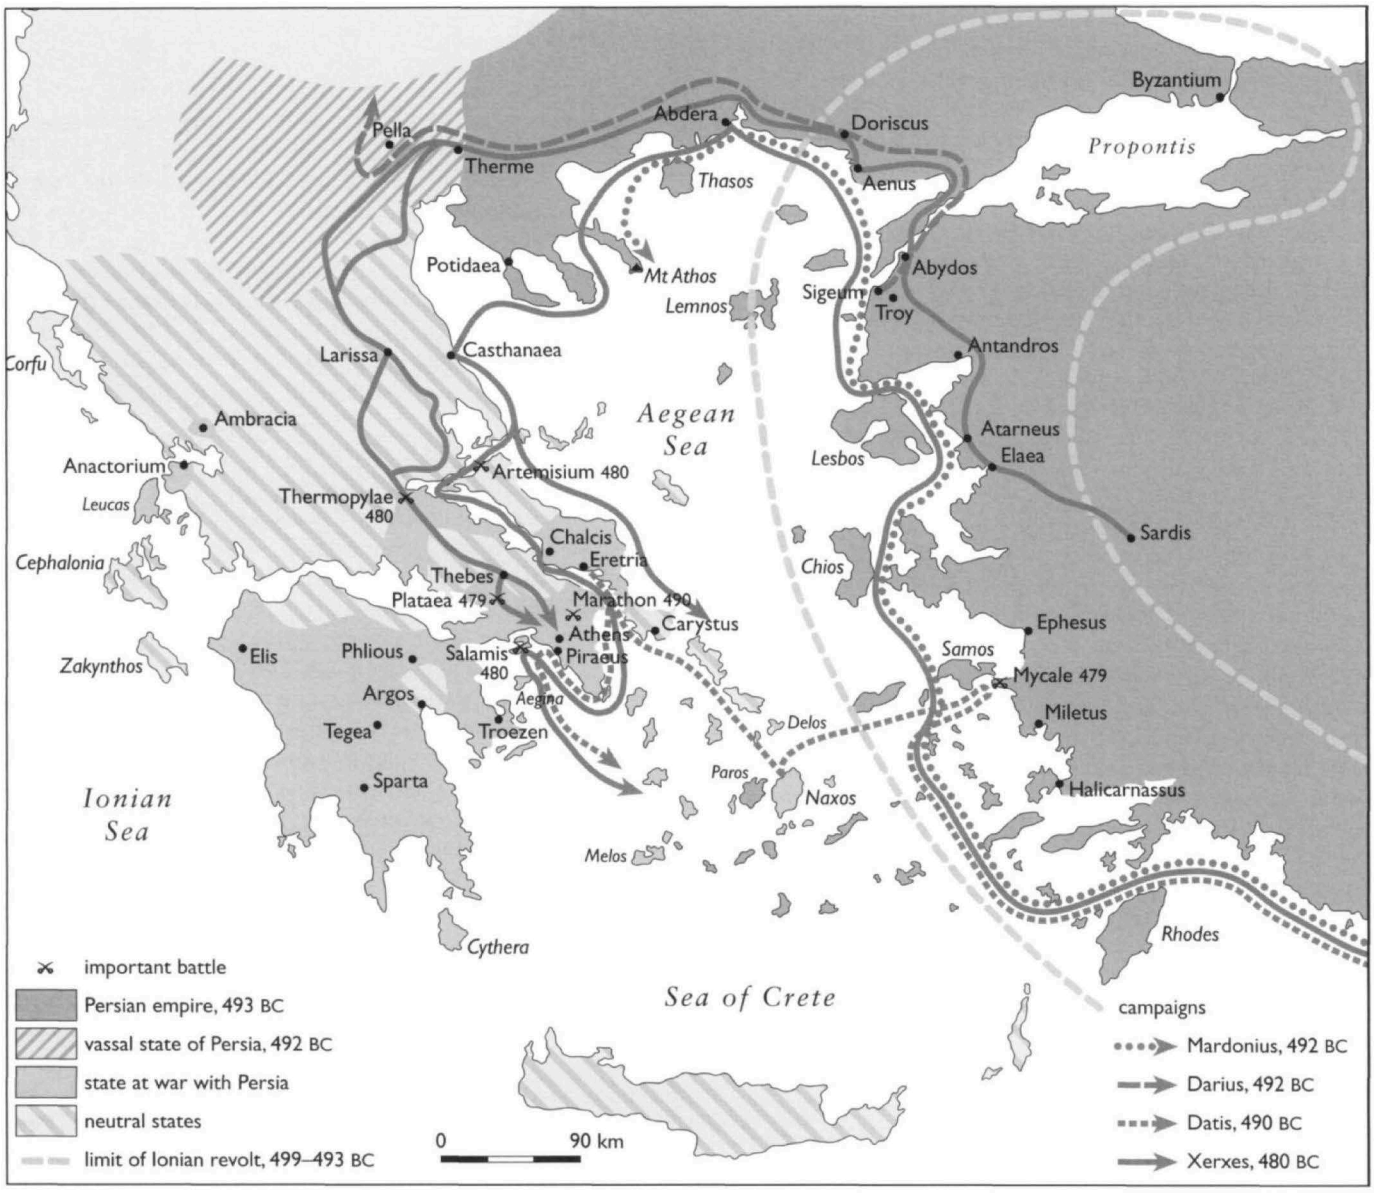
Persian military and naval forces retaliated with a battle off the coast near Lade and an attack on Miletus, which was taken in 494/93 BC. Its inhabitants were taken to Susa and resettled near the Red Sea. Following Miletus' defeat, other cities surrendered, and part of their population likewise was taken to Persia. In 493 BC Artaphernes began the reorganization of Ionia, and in the spring of 492 BC Mardonius, son-in-law of Darius I, was sent to Asia Minor to continue implementing political reforms of the cities of Ionia (Herodotus, 6. 43). Although Herodotus tells us that Mardonius introduced democracy to the cities of Asia Minor, we know of at least two cities, Lampsacus and Samos, which continued their tyrannical rule after 492 BC.

In preparation for a punitive campaign to be led against Athens and Eretria, the Persian king sent an embassy to Greece in 491 BC demanding from the individual states earth and water, the symbolic signs of the recognition of Persian supremacy. Thrace, Macedon, Thasos, Aegina, and other islands complied with this demand, but neither Athens nor Sparta submitted. In 490 BC the campaign was led by Datis and Artaphernes, the son of Artaphernes (Herodotus, 7. 74). Their first target was Naxos, which, offering no resistance, was burnt and looted. From there they proceeded to Eretria and took the city after a seven-day siege (Herodotus, 6. 100–01). A few days later the Persian fleet landed near Marathon, upon the advice of Hippias, the former Athenian tyrant who had found exile in Persia, and who now acted as adviser to the Persians. In the ensuing battle the Persians were defeated by the Athenians, who were under the command of Miltiades. Retreating to Phalerum, the Persians then decided to abandon the attack and to return home. Neither Herodotus' account of the battle nor his casualty figures (6400 Persian dead, but only 192 Athenians) can be given any credibility. While Plataea had sent 600 soldiers in support of the Athenians, Spartan forces arrived a day after the battle.

The Battle of Marathon marked the first military encounter between Greeks and Persians on the Greek mainland, and, although it was won through favourable circumstances and good fortune rather than by military superiority, it had a huge ideological impact on the Greeks. For the Persians, their punitive mission had been successful as far as Naxos and Eretria were concerned. Persian interest in Naxos in 499 BC and the retaliation of 490 BC in fact identify the Persian objectives for their military action, i.e. to assert Persian control in the Aegean. In this regard the campaign of Datis and Artaphernes had been successful. The limited military force used in this campaign, the fact that Darius I had sent envoys to demand earth and water from the Greek cities in order to avoid involving other Greek states, and the fact that the king himself did not participate in this campaign do not allow us to argue that the Persian campaign of 490 BC had been an attempt to subject Greece as part of an expansionist plan.

Nevertheless, Athens still had to be punished, and it meant that a new expedition was prepared over the next four years in which Darius I gathered an army from all parts of the empire, while the king's fleet was prepared and transport vessels were built (Herodotus, 7. 1). But in 486 BC a revolt which broke out in Egypt claimed priority; because Darius had died, aged 66, in December of that year, it fell to Darius' son and successor Xerxes to quash this revolt, which he successfully did by 485/84 BC. Xerxes then turned his attention to the expedition to Greece, carrying out his father's military plans. In 482/81 BC he probably also quashed a revolt in Babylonia under Belshimanni. In Greece the victory at Marathon had not resulted in the political unity of Greek states. A war between Athens and Aegina had broken out and lasted until 481 BC. Themistocles' proposal of 483/82 BC to built an Athenian fleet was accepted as a military plan against Aegina, and was on a par with the fortification of the Piraeus, the Athenian harbour, which Themistocles had advocated during his archonship ten years previously. The discovery of the silver mines at Laurium in 483/82 BC meant that Themistocles now possessed the finances to back his plan. At the same time Persian preparations for a military attack on Greece began. First, Persian envoys were sent to Greece to demand earth and water, which were offered by Thessaly, the people from the Malian Gulf, Locris, Thebes, and Boeotia. No ambassadors were sent to either Sparta or Athens. After Xerxes had gathered his army in Sardis, he crossed the Hellespont and marched via Dorsicus to Therma in Thessaly (Herodotus, 7. 127–31). At the battle of Thermopylae, which was fought on land, the Persians defeated the Spartan troops under the command of Leonidas, but a naval battle fought off Cape Artemisium on the same day was indecisive, the Persian fleet having suffered heavy losses in a storm, and the Athenians withdrawing their ships to Salamis after three days of battle. The Persian army advanced through Phocis and Boeotia to Attica and seized the Acropolis of Athens, the inhabitants already having been evacuated to Salamis and Troezen. With Attica under Persian control the Peloponnesians began building fortifications at the isthmus of Corinth, and those Peloponnesians who were still in Attica abandoned their positions. In September 480 BC Xerxes attacked the Greek navy at Salamis but the narrow straits made it impossible for the large Persian vessels to operate and they suffered heavy losses. Xerxes withdrew his naval forces, which returned to Cyme and Samos, but Mardonius and 10,000 elite soldiers were left to continue the war on land, and to destroy the Peloponnesian fortifications in the next campaigning season. Through a Persian ally, Alexander of Macedon, Mardonius offered the Athenians a peace agreement, including the promise to rebuild the destroyed temples, but the Athenians refused. In the spring of 479 BC, after wintering in Thessaly, Mardonius proceeded through Boeotia without any opposition and retook Athens. The Athenians, having received no support from Sparta, had to evacuate the city again. A second envoy, Murychides, was sent to the Athenians, but he also failed to persuade them to accept the peace. Faced with an Athenian ultimatum, the Spartans finally sent 5000 Spartiates, 35,000 helots, and 5000 *perioikoi* (dwellers in dependent towns). At the ensuing Battle of Plataea Mardonius was killed and his death decided the outcome of the battle. The Spartans took the Persian camp and forced Thebes, who had remained loyal to Persia, to surrender. Their main Persian supporters were sent to Corinth and killed. The Persian troops, now led by Artabazus, returned via Thrace, Macedon, and Byzantium to Persia.

In Asia Minor Chios and Samos began a revolt when the Spartan king Leotychidas was asked by six Chians to assist in



30. The Persian Wars, 499–479 BC

a conspiracy against the tyrant Strattis, while on Samos people turned against Theomestor. In the face of the approaching Greek fleet on Samos Xerxes withdrew his naval forces to Mycale, where a battle with the Greek forces caused the defeat of the Persian army. The battle of Mycale marked the end of the Greek–Persian war of 480/79 BC. Over the next three years Samos, Byzantium, and the Hellespont were taken by the Greeks. For Xerxes his unsuccessful expedition to Greece had no repercussions in the Persian empire, where he continued to rule until his death in 465 BC, while for the Greeks the Persian Wars soon acquired the status of myth, laden with ideological propaganda. This was the beginning of Greek nationalism, marked by the Greeks' identification of themselves as Hellenes and the Persians as barbarians. In fact, neither during the period of 490 to 480/79 BC nor during the actual war of 480/79 BC had Greek political unity ever existed. Some Greek states had remained allies of Persia throughout that period, and during 480/79 BC the Greek states hardly acted as a unified force against Persia. The political rift between the anti-Persian Aristides, who initiated the Delian League, and the anti-Spartan Themistocles after 479 BC showed that even within Athens political opinion towards Persia was divided. Yet ideologically the Battle of Marathon and the victories at Salamis and Mycale boosted Greek morale beyond reality. In retrospect the war between Greece and Persia had become the symbol of the fight for freedom fought by small states against the might of an empire.

The Greek–Persian wars quickly acquired a mythical dimension. Aeschylus' play *The Persians*, performed in 472 BC, shows a Hellenized version of the Persian court, the decadence of Persia, and the hubris of Xerxes, while an earlier play by Phrynichus, *The Fall of Miletus*, performed in 493 BC, was an embarrassing reminder for the Athenians of their half-hearted efforts to defend the freedom of the Greeks of Asia, and the author was fined 1000 drachmas. Herodotus' *Histories*, written around 430 BC, used the huge figures given for the

Persian forces, in contrast to the small number of Greek forces, to demonstrate how successful a united Greece could be. Yet in his account Corinth, which fought against the Persians alongside the Greeks, was discredited, perhaps already in light of the political climate of the 430s BC in which Corinth emerged as an enemy of Athens. In antiquity itself the terms "Persians" and "Persian Wars" became powerful means of political propaganda. Augustus staged the Battle of Salamis in a specially excavated arena by the Tiber in 2 BC, the opposing sides being called "Athenians" and "Persians". In AD 39 Caligula's bridge across the bay of Naples was an imitation of the bridge which Xerxes had built over the Hellespont, used for a demonstration of military manoeuvres, during which the emperor paraded the son of the Parthian king Artabanus II (Josephus, *Antiquitates Judaicae*, 19. 5–6). Following Augustus, Nero also staged a sea battle in Rome, casting shadows on his intended war against Armenia in AD 57/58 (Dio, 61. 9. 6). In the later empire Lucius Verus in AD 161 and Caracalla in AD 214 took contingents of Spartan auxiliaries on their eastern campaign—symbolic gestures which were to reflect the Roman fight against the Persian/Parthian power. In AD 235 Gordian III staged a festival for the goddess Athena Promachus for the Athenians at Marathon, again a symbolic gesture made prior to his eastern campaign. In modern times the fight between the Greeks and the Persians received an additional propagandistic note. It became symbolic of the fight of Western Europe against the Orient. Greece, seen as the birthplace of democracy, architecture, literature, and philosophy, and which had defended its values against the oriental despotism of the Persian king, now represented European and Western values upheld against the perceived threat of the Orient, which became equated with despotism, decadence, and effeminacy.

Persians

The Persians were an Iranian people, identified by their language as Indo-Europeans. Earliest written records identify three different regions of ancient Iran inhabited by Persians: Parsua, southwest of Lake Urmia; Parsumash, in the central Zagros mountains in northwestern Iran; and Parsa, in the southwest. Persian settlement in Parsa (Greek Persis, modern Fars) is first attested in the 7th century BC, and was the result of a migration process which had begun early in the 1st millennium BC, followed by a gradual process of acculturation, in which Persians lived alongside the indigenous Elamite population. It is this region that gave its name to the first Persian empire, which stretched from Egypt and the eastern Mediterranean to the Indus river, and which lasted from 559 BC to 331 BC.

In an exceptionally short but successful period of military expansion Cyrus II, who held the royal title of "king of Anshan", an adaptation of the Elamite royal title, built the Persian empire, first conquering the Median empire of Astyages in 550 BC, followed by the conquests of Lydia in 547/46 BC and Babylonia in 539 BC. With Cyrus II's annexation of the countries of eastern Iran and Central Asia, probably in the 530s, and the conquest of Egypt by his son Cambyses II (539–522 BC), the expansion of the Persian empire was concluded. Though Darius I (522–486 BC) undertook an expedition against the Scythians (518/17 BC) and maintained control over the Aegean (490 BC), his main concern was the consolidation of the empire, focusing on the administration of the provinces of the empire, the satrapies, established in the time of Cyrus II.

The Persians were organized in tribes, among them the Pasargadae, Maraphians, and Maspians. Prominent families of the Persian nobility formed the political elite under the Persian kings. As satraps, they represented the king in the lands of the empire, and were responsible for collecting tribute, levying military troops, and executing the political will of the king. The term "Persians" was first used in the royal inscriptions of Darius I to identify an ethnic class of people, while the king identified himself and the royal family as Achaemenids, descendants of the eponymous founder of the empire, Achaemenes. Though Darius' claim to an Achaemenid lineage might be pure creation in order to legitimize his kingship, the identification of the Persian dynasty as Achaemenids was recognized by Greek and Roman writers. Darius I defined the ethnic term "Persians" further to classify a Persian nobility, who also may have been identified by a common script and language, Old Persian, introduced by Darius I, and by the common worship of Ahura Mazda, the principal god of the Persian kings. The many peoples of the empire were permitted to maintain their distinctive character through their own language, culture, and religion, a latitude by which the Persians aimed to minimize the risk of revolt against their rule in the satrapies. The presence of the satrap, who represented the splendour of the king in the provinces, nevertheless influenced the local elite to adopt and imitate Achaemenid values, which were expressed in architecture as well as in luxury goods such as gold and silverware, jewellery, and Persian-style fabrics and fashion.

The Greeks used the term "Persians" as a general reference to the peoples of the Persian empire, regardless of their ethnic identity. Greek contact with the Persians began as early as the 6th century BC, when the Ionian Greeks under Cyrus II were part of the workforce which built Pasargadae, the first royal city of the Persians, and later Persepolis. In the same century the domestic chicken was introduced to mainland Greece; it was known as the Persian bird (Cratinus, 259; Aristophanes, *Birds*, 485, 707). Achaemenid gold and silver vessels served as models for the "Achaemenid *phialai*" (libation bowls) in the late 6th and early 5th century BC, but Persian influence on Greece increased significantly after the Greek–Persian wars of 490 BC and 480/79 BC, when Greek awareness of the Persians and Persian culture was reflected in literature, art, and architecture. Persian luxury goods became a desired commodity among the Greek elite. Persian garments, imported as well as imitated, were luxury items for wealthy Greeks, and pottery reflecting Persian-shaped vessels was increasingly used. Athenian buildings like the Odeum were built after the Achaemenid model of a hypostyle hall. With the establishment of the Athenian empire in the mid–5th century BC, Athens regularly summoned its allies to Athens to celebrate the Great Panathenaea, during which the latter offered a cow and a panoply, while at Eleusis they were required to present first fruits during the Eleusinia. The procession of the allies can be seen as the Greek adaptation of the tribute or gifts being brought by peoples of the Persian empire, as depicted on reliefs at Persepolis. Intriguingly, during the Panathenaea, the *kanephoroi* ("basket-carriers") carried parasols, a distinctive attribute of the Persian king.

After the collapse of the Persian empire in 331 BC, first Alexander and then the Seleucids adopted many Persian practices, maintaining the satrapal division of the empire, Persian administration, collection of tribute, and the levying of military forces. Adopting Persian dress and royal court ceremony, Alexander even saw himself as the legitimate successor to the Achaemenid throne. In the Hellenistic period the close cultural contact in Asia Minor between the Greek/Lydian community and the local Persians probably led to the Greek assimilation of the cult of Artemis with that of the Persian goddess Anahita, when inscriptions refer to the Greek goddess as "Artemis Anaitis" and "Artemis Persike".

In the Roman period the term "Persians" acquired an extended meaning, generally referring to the people of both the Parthian and the Sassanian empires. European knowledge about the Persians was gradually all but forgotten, except for the names of kings and geographical places, preserved in the books of the Old Testament. Here Cyrus II was perceived as a benign ruler, who allowed the return of the Jewish exiles in Babylon, and who supported the rebuilding of the temple of Jerusalem. Early accounts of ancient Persian ruins were due to individuals travelling through Persia, though their identification was not always possible. Knowledge about the Persians began early in the 19th century with the decipherment of the cuneiform script by Georg Grotefend and Henry Rawlinson and the archaeological excavations of the Persian royal cities of Susa, Pasardagae, and Persepolis.

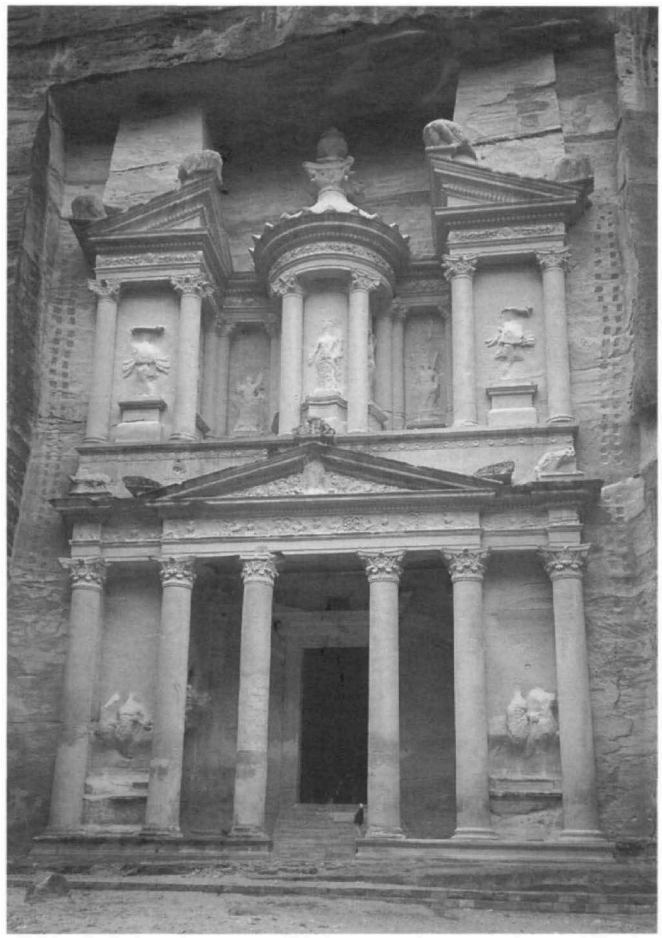
Petra

City in modern Jordan

The city of Petra (in modern Jordan) lies approximately 85 km south of the Dead Sea, in a mountain valley close to Wadi Araba. In the Hellenistic period the city was the capital of the Nabataeans, an Arabic people first mentioned in 312 BC. The Nabataeans were renowned for trade, and Petra was well positioned as a focus for long-distance transport.

The city was in contact with the Greeks from, probably, the 4th century BC onwards, and the Nabataeans became somewhat Hellenized at least as early as the 2nd century BC. Their earliest coins, dating from the 1st century BC, derive from Greek models and show figures in Greek dress. However, the Nabataeans never became wholly part of the Greek world and, instead, showed a remarkable cultural conservatism. Thus, while they adopted Greek (instead of their own Semitic language, related to pre-Islamic Arabic) as a written and legal language after the 4th century, Nabataean names remained commonplace for settlements and other aspects of the environment into the early Byzantine period.

The earliest mention of Petra by name (also in 312 BC) is in a Greek source – written by the author Diodorus Siculus – and coincides approximately with the earliest datable material archaeologically associated with structures in the city. This



Petra: the so-called Treasury has the most ornate façade of all the rock-cut tombs

material comprises sherds of 4th-century BC Greek pottery and the earliest occupation of the city may well date from that period. The city was then occupied through the Nabataean, Roman, and early Byzantine periods.

Although Petra was a flourishing commercial centre and an important city, probably the most famous aspect of its archaeology is the series of *c.*800 rock-cut tombs with monumental façades, some in "Classical" style. These were carved in the sandstone cliffs around the town and included rows of tombs with their façades lining narrow natural rifts in the rock, which provide very spectacular settings. They were probably constructed in the Nabataean and Roman periods, although only one of these is closely datable by an inscription – the "Sextius Florentinus tomb", which can be ascribed to the early 2nd century AD.

The rock-cut tombs are today known by modern names, such as the "Treasury", "Deir", and the "Urn Tomb", but although some tombs show indications of reuse, such names need have no bearing on their early history. Although these façades look like buildings, the town itself was not rock-cut; the façades represent an elite cemetery for its inhabitants.

In AD 106 the Nabataean realms, including the city, were peaceably annexed by Rome. In the early Roman period it continued to thrive as a trading town and was elevated to the status of a *colonia* in the early 3rd century. Romanizing facilities – such as a theatre, monumental fountain, and colonnaded street – were constructed, and the city's elite became partially Romanized. The importance of the city in the Roman world appears to have continued into the 4th century AD, when it became the seat of a bishop, later a metropolitan.

Petra retained its status as a city, and was under effective Byzantine administration, into the 6th century. It was elevated to the role of capital of Palestina Tertia and new walls were built. As in other early Byzantine provincial cities, older constructions were reused and remodelled: for example, the shops along the colonnaded street were replanned and an inscription shows that one of the Nabataean tombs (the "Urn Tomb") was consecrated as a church (perhaps the first cathedral of Petra) in 447. These modifications have often been misinterpreted as indications of decline, but this interpretation is not sustainable in the light of newly available evidence.

Until recently, conclusive evidence regarding the character of early Byzantine Petra was lacking. But the discovery of 50 rolls of papyri, comprising a 6th-century archive, has transformed modern understanding of the later phases of the town's history. These were found in the storage room of an elaborate 5th- and 6th-century church, probably the cathedral, destroyed by fire. The archive provides a great amount of information about the town in the 6th century, demonstrating that it was still a focus of administration and occupation and the population included soldiers, clerics, farmers, a doctor, and craftspeople. The city was densely populated and there were houses with terraced roofs and internal yards.

Although this has clarified the situation in the 6th century, the end of the city is very obscure. Nevertheless, claims that it ceased to be used in the mid-6th/early 7th century have been shown wanting. New archaeological and textual information suggests that Petra may have survived in some form into the 7th century, and the church archive contains papyri of late 6th-century date. The city may have been bypassed by invading Islamic forces, perhaps because of its highly defensible location, and then peacefully abandoned. The probable cathedral was disused after having been set on fire, although whether this was by attackers, by chance, or by inhabitants unwilling to see it fall into enemy hands is uncertain. So, too, is the date at which the fire occurred: 7th-century pottery found in the church is attributed to "squatters" occupying the site following the fire, but ceramics found in Byzantine churches are generally associated with continuing use. Once its Byzantine inhabitants departed, the city was deserted, only to be rediscovered by European archaeologists in the 19th century.

KEN DARK

Summary

A Nabataean city 85 km south of the Dead Sea in modern Jordan, Petra had contact with Greeks from the 4th century BC and was to a degree Hellenized by the 2nd century BC. Greek language and Greek-style coinage were adopted, but other cultural features remained Nabataean. It became a bishopric in the 4th century but was deserted in the 7th. Today it is most famous for its rock-cut tombs.

Phaestus

City in Crete

Phaestus is located in the Mesara plain in south central Crete. The Mesara is the largest fertile plain outside the Greek mainland and has always been a focus for cultivation and settlement. Its edges are defined to the north by the Ida range (Mount Psiloriti) and to the south by the Asterousia ranges, which block access to the southern coast; the plain runs into the Libyan Sea to the west at the bay of Mesara. Phaestus, along with Hagia Triada, is located on a ridge rising some 100 m above the plain and running east–west in the middle of it. Phaestus is set on the eastern summit of this ridge, with a commanding view of the plain below and to the east, while Hagia Triada is located at the west end, overlooking the Ieropotamos river where it runs into the sea.

Occupation of the Phaestus site is attested by deposits of pottery and by scraps of architecture from as early as the late Neolithic period (*c.*4000–3500 BC) and also in the Early Minoan period (*c.*3500–2150 BC). However, the principal architectural remains uncovered by the extensive excavations attest to the grandeur and importance of the site during the "palatial" period of Minoan civilization (*c.*2000–1450 BC). As at Mallia and Knossos, Phaestus went through two principal periods of use at this time, the protopalatial (*c.*2000–1700 BC) phase and the neopalatial (*c.*1700–1450 BC) phase, thus around 550 years during which a great deal of continuity of social structure and religious practice is evidenced at the site.

Although second in size to Knossos, Phaestus is the principal site in Crete for the study of the protopalatial period. At Knossos and Mallia, reconstruction work in the neopalatial phase obscures much of the earlier history of the building complexes, but careful excavation by the Italian team at Phaestus since 1900 has revealed much detail about the earlier period. Principal architectural features are a massive western facade of cut ashlar blocks, clearly forming the public face of the building, which fronts on to a west court that is built on three levels. The preservation of the protopalatial court and facade is due to the removal of the facade wall some 8 m to the east and the raising of the central part of the court by at least 1 m during the neopalatial rebuilding phase.

The west court is paved with flagstones and marked by characteristic "raised walkways", present at the other palaces and plausibly interpreted as defining processional routes. One branch of these walkways leads to the "theatral area", a flight of low steps backed by a wall, interpreted as a place for people to stand or sit while watching or participating in events in the west court. A shrine has been identified in the immediate vicinity. A second branch leads to the protopalatial entrance to the palace, considerably simpler than its neopalatial successor and located further south. A third branch leads by a winding route to the lower west court, where the facade of the palace continues, behind which lie rooms interpreted as workshop and possibly domestic areas.

The principal effect of the neopalatial remodelling of the western area was to create a massive propylon leading off the west court, apparently to serve as a monumental entrance to the palace. This entrance may also have served to limit access to the palace, since exits from it were small. Beyond lie the storage areas and the central court. Both features were present, in slightly differing forms, in both protopalatial and neopalatial periods. The storage areas consist of rooms containing massive pithos storage jars, for storing grain, oil, or wine; caches of Linear A tablets and clay sealings found in this area, principally of the protopalatial phase, have revealed much of the workings of the bureaucracy of the palace. In particular, not only jars but also doors seem to have been sealed, and seals often bore the impression of multiple seals, perhaps an indication of hierarchy in the palace personnel.

The paved central court was colonnaded and furnished with a fine north entrance. The possible functions of the central courts of Minoan palaces remain obscure, with suggestions ranging from a simple place of gathering to the possibility of bull-leaping ceremonies (also given as suggestions for uses of the west court). The court is aligned with the remote Kamares cave in the mountains to the north, where excavation revealed characteristic sacred cave deposits, including examples of the old palace pottery style now called "Kamares" ware. North of the court is a series of rooms forming the characteristic "Minoan hall complex" of the neopalatial period, with two halls and anterooms, light wells, corridors, and a lustral basin. This area seems to form an equivalent to the "domestic quarter" at Knossos. Other sections of the palace have been identified with workshop, ceremonial, public, or private space.

Although the size of Phaestus is not great, it is spectacular by prehistoric standards, and not all of the area has been excavated. The palace buildings represent a flourishing and highly complex centre, whose relationship to its hinterland is still far from clear. The storage facilities seem impressive, but probably do not represent the whole output of the Mesara, so it seems likely that only partial concentration of harvest at the centre was occurring. By the neopalatial period a number of lesser centres ("villas") had sprung up in the countryside and seem similarly concerned with the organization of agricultural production. But in the protopalatial period, archaeology has revealed little infrastructure that can be associated with the palaces in the countryside. It seems likely that the symbolic and ideological aspects of the palaces were always primary and that

the coming into being and flourishing of these places depended on the importance attached to such aspects by most, if not all, of the population. The difficult question of what portion of the population might have lived in a town around the palace has not been resolved for either phase.

Phaestus suffered, with much of Crete, at the end of the neopalatial period, as a result of either natural catastrophe or human intervention, or both. Some LMIII occupation is attested, and it is assumed that the site is signified by the Linear B *pa-i-to*, but in this last period of the Bronze Age the focus of occupation was the west end of the ridge, at the site of Hagia Triada. In the neopalatial period a large Minoan villa was constructed here, with characteristic features such as a "Minoan hall complex" and storage areas. Neopalatial finds from Hagia Triada are in many ways more impressive than those from Phaestus itself in this period, including a Linear A archive associated with storage areas, frescos, copper ingots, and objects regarded as high art. In the later Bronze Age a large building, interpreted by some as a Mycenaean megaron, was built at the site. This has been taken as an indication of Mycenaean control of the area at this time; it certainly points to new occupation in the area with a complex organization. The surrounding area includes a large number of houses and a large open space with a complex of storage places or perhaps of shops.

Evidence for post-Bronze Age occupation at Phaestus has come to light in various excavations on the ridge. At the palace site a temple, probably dedicated to Rhea, has been investigated at the southwest edge of the excavations. This was founded in the 8th century and used throughout the Classical and Hellenistic periods. Other geometric remains including houses were located west and southwest of the palace, and elsewhere on the ridge. Occupation certainly continued through the Archaic and Classical periods, although historical and archaeological evidence is rare. The Hellenistic period represents something of a revival. Phaestus was one of the city-states of Crete, and both the palace site and other sites on the ridge, including Hagia Triada, have revealed substantial remains of settlement. Apart from the temple of Rhea, there was also a temple to Apollo or Asclepius, a city wall, and paved roads. Phaestus remained independent, though subject to Gortyn, until the mid-2nd century BC, when it was sacked by Gortyn and not reoccupied.

Roman remains are few, but in Byzantine and Venetian times churches and a monastery were founded on the ridge, including the church of Hagios Georgios Galatas with 14th-century frescos, and tombs have been located in some excavations. The site of Hagia Triada was occupied by an Ottoman Turkish village until 1897.

Summary

The site of Phaestus in the Mesara plain of south–central Crete has been occupied since the late Neolithic period but its principal remains are of the Minoan palatial period (*c.*2000–1450 BC). Though second in size to Knossos, it is the chief site for the study of the protopalatial period. It continued to be occupied until the mid-2nd century BC when it was sacked by forces from Gortyn. The Minoan villa at nearby Hagia Triada has yielded impressive finds.

Phanariots

A social, economic, and political elite under Ottoman rule

The Phanariots were an influential nobility that was especially active in the last two centuries of the Tourkokratia. They were named after the Phanar district in Constantinople on the south sea-front of the Golden Horn, where these families settled and lived. The area also became a significant centre of Greek presence at that time due to the transfer of the Ecumenical Patriarchate from the Pammakaristos monastery to the church of St George in Phanar at the turn of the 17th century. In the course of time, the Phanariot oligarchy managed to distinguish itself by its educational and cultural status, its commercial and financial activity, and its concomitant prosperity. This enabled the Phanariots to form a distinct social class within the society of Constantinople and to hold vital positions in the Ottoman administration from the second half of the 17th century onwards. From the Phanariot milieu came also a few patriarchs (e.g. Samouil Chantzeris). The Phanariots' intimate relationship with the Orthodox Church, in whose affairs they often interfered, is evident from their numerous benefactions. These developments attest to their great influence in the Ottoman empire, a fact that had significant repercussions for the Greek subjects too.

The Phanariots were not descendants of old, eminent Byzantine families who had remained in Constantinople after the fall of Byzantium, as some Phanariots later claimed and as is still erroneously believed. The Phanariots came mostly from provincial elite families who had moved to Constantinople later. Nor were they ethnically exclusively Greeks: some Romanian and Albanian families were included in their ranks. The Phanariots acquired an enhanced social status when important changes were made in the structure of post-Byzantine Greek society. In fact, there was an internal rivalry between the decaying old Greek aristocracy of Constantinople and the emerging class of new rich Phanariot families looking for positions of power and privilege within Ottoman society. Among Phanariot family names the following may be mentioned as prominent: the Aristarchis, the Mavroyenis, the Chantzeris, the Mourouzis, the Rangavis, the Racovitza, the Ypsilantis, the Neroulos, the Mavrokordatos, the Ghika, the Kallimachi, the Soutsos, the Karatzas, the Rosetti.

The first high office held by Phanariots was that of principal interpreter (*megas dierminevs*) to the Sublime Porte, which needed capable and skilled diplomats with a knowledge of western languages for its negotiations with European states. The first interpreter to be appointed was Panayotis Nikousios (1613–73), who was succeeded by Alexander Mavrokordatos (1641–1709) known as the Exaporite (*ex Aporrhiton*, "of the Secrets"), a man of remarkable erudition and skill, who negotiated the Treaty of Karlowitz in 1699. In fact, this office became a Phanariot monopoly throughout the 18th century until 1821. The last interpreter, Konstantinos Mourouzis, was executed in 1821 at the outbreak of the Greek War of Independence. Another office held by the Phanariots was that of interpreter to the High Admiral of the Ottoman Fleet (*dierminevs tou stolou*). The holders of these two offices were often in a position to extend their influence far beyond their immediate duties. Thus, as principal interpreters, they managed to influence the direction of Ottoman foreign policy in a decisive way and had contacts with many Western leaders, noblemen, and state officials. Further, as interpreters for the Ottoman fleet, they followed the *kaptan pasha* (admiral) and had the opportunity as intermediaries to deal with various issues pertaining to the Greek population in the Aegean islands.

Aside from these two offices, the most important post held by the Phanariots was that of prince (*hospodar*) of the Danubian principalities of Moldavia and Wallachia from the beginning of the 18th century. These regions belonged to the Ottoman empire, but retained their autonomy and were ruled by local princes. Although this office had already been given to Greeks (e.g. the Kantakouzenos family) in the 17th century, Moldavia from 1709/11 and Wallachia from 1715 were governed until 1821 exclusively by Phanariots drawn from a total of 11 families. In the capitals of these principalities, Jassy and Bucharest respectively, the Phanariots established their own courts with an entourage of courtiers and officials comparable to the imperial court in Constantinople. Due to the opportunities for wealth and power offered by these fertile regions, the competition between the Phanariot families for this post was particularly strong and there were constant plots and intrigues among them in Constantinople either to secure it or to overthrow an incumbent. In this way, the corruption of the Ottoman governmental system permeated also the Phanariot milieu in its various dealings with Ottoman authorities. It is no wonder then that Phanariot princes usually remained in office for a short time (an average of less than three years), though they often tried to incapacitate their rivals in the capital by various means, e.g. through their confidential agents (capuchehaia) in Constantinople.

An important contribution of Phanariot rule in the Danubian principalities had to do with the promotion of Greek culture through education. The organization and reform of the princely academies of Bucharest and Jassy transformed these cities into great centres of Greek culture, where numerous eminent, western-educated Greek intellectuals lived and taught (e.g. Nikolaos Zerzoulis, Nikephoros Theotokis, Josephos Moisiodax, Daniel Philippidis, Benjamin Lesvios, Stephanos Doungas, Konstantinos Vardalachos, Nikephoros Doukas, Stephanos Kommitas). Thus, the principalities became important channels through which Western ideas and influences reached the Greek world. Some Phanariots showed a particular predilection for making contacts with 18th-century Western intellectuals, for translating Western books into Greek, for publishing their own contributions in various fields (e.g. medicine, poetry, political thought and ethics), for stocking libraries, and for supporting intellectual endeavours (e.g. publishing books, inviting scholars to teach). The debt owed to these activities becomes evident from the dedications of many books by Greek scholars to Phanariot princes.

Other Phanariots (e.g. Dimitrios Katartzis) were supporters of the Ottoman empire and introduced certain social and intellectual reforms in the principalities without, however, calling into question the existing status quo. After the start of the French Revolution many Phanariots expressed certain reservations towards Western philosophy and some even collaborated with the patriarchate of Constantinople (e.g. at the patriarchal press) to suppress its impact in the East, though they acted out of their own interests too (e.g. in order to castigate the ambitious mercantile class supporting the Greek Enlightenment and the restructuring of society). But again, the Phanariots never resorted to blind reactionism and counter-Enlightenment, as many Orthodox clerics did; and some of them translated French works into Greek. The impact of the Phanariots is evident from the statement of a Greek intellectual in 1719 that the Phanar was no longer found in Constantinople, but was transferred to Bucharest. A large Greek merchant community had also settled in the principalities and did good business with central and western Europe. The establishment of Phanariot rule in the Danubian principalities thus facilitated the coexistence of a Greek bourgeoisie with Romanian boyars.

The Phanariots were strongly influenced by various elements of Greek culture, which they promoted through their writings and in other ways during their rule in the Danubian principalities. On the other hand, they were also influenced by the cherished heritage of Byzantine Orthodoxy. Some of them actually dreamed of recreating the Byzantine empire. Due to their involvement in the Ottoman administration, their social status, and their alliance with the Orthodox Church, the Phanariots were not bound to any specific national tradition, which explains why they did not favour the revolutionary ideas coming from the West.
